Nachting.

THE following, from the Kansas City Star, is much on a par with some of the expert testimony brought out by the sailing of Dominion last summer:

Having read to her pupils a description of the sinking of the Merrimac, the teacher some days later asked them what the word "catamaran" then used meant. These are some of the answers:

A catamaran is a mounting lion.

The catamaran is a savage officer in the Fillipose Islands.

A catamaran carries clubs in a golf game.

A catamaran is the place in Chicago where the cat show was held.

The catamaran was a convention hall prize.

The catamaran is the proper name for a catboat and war ram together, like the Catadin.

Hobson obtained a catamaran from the Spanish officers, which was all he had to eat.

Gasolene Engines and Launches.—IV.

BY F. K. GRAIN.

(Continued from page 220, March 18.)

PITCH OF PROPELLER.—The pitch of a propeller wheel is the distance the wheel would travel during one revolution if it were a screw working in a nut. For instance, if your wheel has a pitch to the blades of say 30in., it will travel that distance if revolved once, or if the wheel is held stationary fore and aft and revolved once as in a boat, it will move the boat 30in. Of course, this is not making any allowance for slip. The slip of a propeller amounts to, roughly, 15 per cent.

Now we will assume that which is very true, which is

that hardly any two boats of the same length, but of different form get the same results from the same wheel, and in a certain case the motor runs away with the wheel. What is to be done? In most places increasing the pitch of the wheel will remedy the defect; but if it does not, a new wheel of larger diameter will have to be substituted.

Then there are cases where, when sufficient pitch is given the wheel to get the proper speed, it slows down the motor, so that results are balanced.

In such a case begin by cutting off $\frac{1}{2}$ in. from the ends of blades. Make a paper pattern so as to cut all alike. If then it does not work, another $\frac{1}{2}$ in. can be taken off. A good deal will have to be left to the judgment of the owner, as, of course, there are no set rules, and the cutting process cannot be done too extensively. We have seen wheels of 18in. diameter cut to 15in., and one of 36in. cut to 28in., and in both cases the speed of the boat was increased about 25 per cent.

It is a mistaken idea to suppose that you will increase the speed by attempting to overload your motor with wheel. It should be of a diameter and pitch that the motor will handle with ease. Some wheels will slip or race, and not take hold if started at once at or near full speed; in such cases the remedy being to start up slow and gradually bring the motor up to the desired speed.

We have seen cases, especially in launches of 25ft. and under, where the wheel would continue to race no matter how much the speed was varied. This is generally caused by the wheel being too close to the surface. The remedy is, after the motor is started to walk forward so as to throw the wheel out as far as possible. Then move quickly aft on to the stern, which will cause the boat to settle by the stern and the wheel will then take hold and keep itself down in solid water, unless too much weight is carried into the bow.

In all cases have your wheel made of good hard bronze and be sure it is finished smooth all over, as the resistance of a roughly-finished wheel will spoil the best efforts of the designer.

The next point to be considered is the number of blades you intend to use on your wheel. As commonly made, they are furnished two, three and four bladed. For small wheels at high speeds we safely leave out of consideration the four-bladed variety, for reasons too numerous to mention here. The three and two-bladed are the varieties mostly in use. When possible the three-bladed wheel gives the best all-round satisfaction, but the two will give in most cases equally as good results, excepting that there is without doubt more vibration from its use. Mostly all reversing wheels that feather their blades are made with but two blades, owing to the third blade complicating the reversing mechanism. By all means allow the builders of your motor to use their own judgment in furnishing the wheel, as they in most cases know the wheel that will produce the best average results. In event of their failing you can then experiment for yourself.

TOOLS.—If not provided with proper tools, the following will be a good collection of useful and in fact indispensable tools. By all means buy the best and always carry them with you at all times, as there is no telling when you may need any or all of them: One 8in. Stillson pipe wrench; one 12 or 14in. Stillson pipe wrench; one 10 monkey wrench; one small monkey wrench; one 6in. three-square file; one pair pliers; one sheet emery cloth; one hammer; one small roll asbestos paper; 10ft. copper wire.

HULLS.—It is not our purpose to give minute instructions for constructing a hull, but only a few points that will enable you to pick out or order built a craft that will be constructed in the proper manner.

To begin with, your hull should have a good sound oak keel of ample size, set on edge, the stem to be of Hackmatack natural crook, the sternpost of oak, allowing at least 1in. of wood clear of each side of the shaft boss. The sternpost should be dove-tailed into the keel, and the overhang, of oak, into the sternpost. The ribs should be of good young growth white oak, steam bent, and of good size, placed not further than 12in. apart from centers. Fastened to the keel and reaching up from 12 to 18in. on each rib should be a floor timber of natural crook wood securely fastened to the keel and the ribs.

By all means have your boat planked with white cedar and as heavy as possible, as power boats have an inclination to hog, or, in other words, to settle at the ends, therefore, the fore and aft wood is the material that will have to take this strain. White, yellow and cork pine, oak and cypress, are used for planking, but for boats of 50ft. good cedar will always be a favorite, it is light, tough, and very elastic, and under ordinary use will last a lifetime. Furthermore, it will not dry apart and stay apart like many other woods, and is therefore especially adapted for a boat that may lay ashore part of each year.

Be sure the seams of your planking are hard up inside and open slightly on the outside. When the seam is open inside it is what is called a hollow seam, and will not hold caulking of any kind. Such seams are caused by poor workmanship, and will always give trouble and in many cases, especially when under water and hidden by flooring, are a source of danger.

The fastening of the planking should be copper nails, riveted on the outside over copper burrs, but in no case nails or tacks clinched down. At the ends of the planking and in all places where a copper nail cannot be riveted over a burr, the proper thing is a good galvanized boat nail. Be sure all knots have been tested, and when one is loose, knocked out, and a white pine plug fitted in its place. If a check appears in the planking, which is quite liable to happen, especially in cedar, it should be carefully traced out to its limit, then bore at its end a $\frac{1}{4}$ in. hole and plug same with white pine. This will stop any check from running further.

The planking should be carefully caulked with the best quality cotton, care being taken not to drive it through, also not to put it in too tight, as many a good boat has been ruined and made leaky by too much and too hard caulking. As regards width of planking, narrow certainly looks better, and in many cases enables the builders to secure a better finished surface, also lessening the liability to check, but on the other hand, rather diminishes than otherwise the strength of the boat, besides making more seams to look after and leaks. Personally, we prefer wide plankings, but when used and fastened with a copper nail on upper and lower edges, it should have in addition a galvanized boat nail between to prevent any tendency to buckle.

The decks, coaming and joiner work are now most commonly made of oak, finished in the natural wood. When oak is used and finished natural, great care must be taken not to allow it to get weather stained, as it is almost impossible to reclaim it. White pine makes, without doubt, the best deck, but care must be taken not to mar or walk on it with shoes having nails, as it is easily dented, and on light work can not, of course, be planed or scraped very often. Pine, both white and yellow, make very nice wainscoting, seats, etc. Cypress is also used for inside work and finishes very handsomely, it is, however, necessary to paint and varnish it inside and out when being put up, otherwise it is affected by dampness to such an extent that it will shrink and swell to excess and cause trouble.

It is an excellent plan to allow the sternpost to project above the deck to form a good towing post, also to have one in the bow, as a line can be made more secure, and it can be done quicker than on a cleat, especially if the cleat is not very large. Either towing cleats or post should be as far forward of the rudder as possible in order to have the boat steer properly.

When possible have a shoe of oak from $\frac{5}{8}$ to $\frac{7}{8}$ in. planed on the under side of your keel, and when same is put on, let there be two thick coats of paint put between. This shoe will protect your keel from injury and prevent it from being eaten by worms. Should the shoe become worn or eaten, it is but a small matter to renew, whereas, it is a very expensive one to put a new keel in. There should be a good stem band of brass fastened with brass screws.

RUDERS.—The skeg and rudder should also be of brass with a suitable stuffing box for the rudder post. Rudders are made in many different forms of construction, but that most in vogue consists of a post with arm at right angles, to each side of which is riveted a thin sheet of metal, the two sheets then being riveted together around the edge. The best form, we think, consists of a single plate of metal with a heel and rudder post, into which the plate is slotted. This makes a strong and easily repaired rudder, and has the advantage that it can be patched at any place or time. The fittings or hardware even to the smallest nail should be either of brass, copper or galvanized iron. We incline toward brass for all deck fittings, as with galvanized iron, as soon as the surface is worn off, there remains, of course, nothing but the raw iron, which rusts and looks badly; not only that, but brass can be kept bright and adds materially to the looks. There should be a pair of bevel chocks on the bow and a pair of either straight or bevel on the stern. Both bow and stern should be provided with a good sized cleat and a flag pole socket. Care should be taken to have the chocks and cleats of ample size and strongly fastened.

Most all launches are provided with a suitable steering wheel, which, we are sorry to say, the majority of launch owners pay more attention to and think more of than they do the propeller wheel. Be sure that the tiller of the rudder is so placed that in case of accident to the steering wheel or its gearing, that the boat can be controlled by the tiller. Never go out without a good pair of oars, as there is no telling when you may meet with a break down, and when this occurs in a small launch in a heavy sea on a lee shore, it is a serious business.

ANCHORS.—Anchors are the only insurance a small boat owner has, and it behooves every owner to have two good ones, one medium and one heavy weight, both to be provided with ample cable. A spare anchor and cable can be stored under the flooring, they take up no room, and do not cost much, but may at any time be the means of saving your boat. Let me caution you against the universal mistake of not giving your anchor sufficient cable. It must be borne in mind that it is next to impossible for an anchor to hold if hove up short, especially until it has worked itself down into the bottom. If plenty of cable is paid out when the boat swings or rides up her anchor it will only turn the anchor without tripping it, whereas if the cable is short the anchor will trip or turn over.

[TO BE CONTINUED.]

Work at Bristol.

WITH the arrival of both nickel steel and Tobin bronze plates at Bristol, five weeks ago, came apparently the end, so far as the material for the plating of the new cup defender was concerned, of what C. Oliver Iselin facetiously called the "guessing contest" into which he and the Herreshoffs had lured the newspaper men. Everything pointed to bronze plating below the waterline and nickel steel above, but the progress of work on the boat for the past week has shown that tobis bronze will be used clear to the rail.

The bronze plates are being put on the boat as fast as the workmen can get them there, while the steel plates are going into the bulkheads, floors, deck strapping and deck stringers of the boat, and into her steel spars. Mr. Iselin has scored a point, but the correct information is out at last and with the launching of the boat from her locked and guarded shop still two months away.

Still it is only fair to Mr. Iselin to say that he never expected the "guessing contest" could be kept up until launching time, but was only anxious that it be made as long as possible. Whether or not the cat is out of the bag earlier or later than he expected, he alone knows, but undoubtedly he has had many a quiet laugh over the guesses.

In the meantime the boat is steadily growing under the hands of skilled workmen, and at the same time is showing that something more than "guessing" has been done in giving previous information about her. She is in every important respect, except that of topside plating, the boat that was detailed in The Globe four weeks ago. The construction shows a few differences in minor details, but the model, general dimensions and scheme of construction as then given have been confirmed from reliable sources of information.

The over all length of the boat was then given as about 130 ft. This was before a single frame had been put in place, and was based on the knowledge that 77 frames, spaced 20 in. on centers, would go into the boat. The construction is now so far along as to show that the boat's structure goes about 3 ft. forward of frame 1, and about 2 ft. aft of frame 77, giving very close to 131 ft. over all, or just 7 ft. longer than Defender. Her beam is just over 24 ft., as then stated, or a foot more than

Defender's and her draft close to 20 ft., with the probabilities of something less rather than over that figure.

Her sail plan is still largely a matter of conjecture, in spite of confident assertions as to length of spars, etc. It can safely be said that no one not in her builder's confidence knows her exact sail plan, or just where the additions will be made to give her the greater sail area than Defender that is assured. The sail area will assuredly be materially larger than Defender's, and all indications point to an extension upward rather than on the base line. Such an extension would be in line with the model of the boat, for she is evidently designed to heel well out when sailing, as is shown by the "tumble home" of the topsides to save dragging the lee rail and deck through the water.

This "tumble home" is not in itself a very pronounced one, but is quite marked as against the straight side of Defender or the flaring side of Vigilant. With it the boat will be more easily driven at a great angle of heel, while at the same time she will not throw quite so high a side out to windward as with straight topsides.

The yachtsmen who have been privileged to look at her are enthusiastic in praise of her model and expected speed.

In the big shed of the Boston Spar Company, on Concord street, East Boston, is the longest and handsomest stick of Oregon pine that it has ever been the writer's good fortune to see. Its beauty as a spar would alone make it well worth seeing, but when is added the fact that it is to be used in the new cup defender building by the Herreshoffs at Bristol in case her steel mast does not prove all that is expected, the combination is simply irresistible as an interesting one.

Manager William E. Bailey of the company, at the request of the Herreshoffs, refrains from telling visitors the length of the spar, or its other dimensions, but he makes no attempt to conceal his pride in its beauty, nor could he be blamed for such a feeling. The great length and thickness of the spar, its wonderfully straight grain and whiteness, and its surprising freedom from knots, checks and sap or pitch streaks, together with the excellent job of work done in fashioning it from the rough stick, make it not only a subject of just pride to the company furnishing it, but also to every one interested in the boat for which it is intended.

The spar is finished from the bottom to within about 25 ft. of the top. Here the head has simply been roughed out, and the finishing and fitting of the hounds, caps and other iron work will be done in the Herreshoff works at Bristol. This absence of finish at the head gives opportunity for another "guessing contest" as to the length of the spar when finished and ready to be put in place. The extreme dimensions can be told, but not the amount that Herreshoff workmen will cut away in the finishing.

The length of the spar is very close to 107 ft. As "roughed out" for a 20-foot masthead there is a possibility of a finished measurement of 80 ft. from deck to hounds, or 8 ft. more than shown in the old Defender's mast. Probably the finished spar will show something less than that, but the length of the spar in itself confirms the increased sail plan for the new boat over Defender that has been indicated from her model and the increased weight of her lead keel.

Between 23 and 24 ins. is near enough to the diameter of the spar for any one who is not concerned in making the fittings for it. The spar has been made with the butt end of the original stick uppermost—that is, the head of the mast has been worked out of the lower end of the tree, thus giving the greatest strength at the upper end of the spar, where there is the greatest strain. This has also permitted the working of the cheek pieces to support the hounds out of the solid stick, so that no bolting on of extra pieces is required.

Making the mast to stand the opposite way from the original tree also brings the few knots that show down close to the foot, and it is doubtful if any of them can be seen above the deck if ever the mast is put in place. The stick has been drying out in the shop since last fall, when the order for it was first placed, and it is in fine shape. It has been smoothed to within a few feet of the head and well rubbed with lard and yellow ochre to keep it from checking.

It is a noble spar, and it seems a pity that it is only being made to play second fiddle to a steel one. Yet its chance may come, since the steel mast is an experiment whose success the very making of a wooden mast shows a possible doubt.

The Herreshoffs have also ordered from the spar company for the new boat, two bowsprits, two topmasts, two spinnaker poles and two complete sets of club topsail poles for topsails of different sizes. Topmast and bowsprits are of Oregon pine and the other spars are of spruce. All are fine-looking sticks and splendidly worked out and finished. No booms or gaffs have been ordered, showing that full reliance is to be placed in the steel boom and gaff now building at Bristol. The use of these spars in the Defender has undoubtedly proved that they can safely be depended upon.

Mr. Bailey has furnished the spars for Defender, Vigilant, Colonia, Navahoe and many other Herreshoff boats. He expects to ship the new boat's spars to Bristol within ten days.—Boston Globe.

The Seawanhaka Cup.

COM. JAMES ROSS, Royal St. Lawrence Y. C., has ordered a new 20-footer, of course, designed by Mr. Duggan, for the defense of the Seawanhaka cup. The two twenties of last year, Speculator and Strathcona, are still available for the trial races, with Glencairn II., but there is comparatively little interest in the class this year, and probably but one new boat, as above, will be built.

A syndicate of the Bridgeport Y. C., headed by Mr. T. H. Macdonald, has ordered a design for a 20-footer from B. B. Crownshield, a centerboard boat about 32 ft. over all, 8 ft. beam and 17 ft. 6 in. l.w.l., similar to Duchess, the 21-footer.

It is reported that the fin-keel Vanenna, of Chicago, built at the same time as Vencador, will be sent to New York by her owner, W. R. Crawford, and raced on Long Island Sound.

Neaera, schr., has been purchased by Thos. A. McIntyre from the estate of the late F. W. Lockwood.

The Canada Cup.

THE contest for the Canada cup promises the most interesting series of races ever yet sailed on the Great Lakes. Prior to the final races for the cup itself, to be sailed off Toronto in August, there will be two series of trial races, one at Toronto for the selection of the defender, and one at Chicago for the selection of the representative of the Chicago Y. C., the challenger.

Of the yachts now building for the defense of the cup the most interesting is naturally the one designed by Mr. G. H. Duggan, of the Royal St. Lawrence Y. C., of Montreal designer of Glencairn I., Glencairn II., Sothis, Speculator and Dominion. This yacht, now building by Harry Hodson, at Toronto, is for a syndicate of R. C. Y. C. yachtsmen, headed by Mr. Geo. P. Reid, of Toronto. She will be handled by a Corinthian crew, under the direction of Mr. Wilton Morse, who will steer her. It is very natural that Canadian yachtsmen should have a good deal of faith in Mr. Duggan, and they are anxious to see him succeed in a larger type of yacht than the 20 and 15-footers. Contrary to the general opinion, Mr. Duggan's experience prior to his successes in the 15 ft. class was not in very small craft, but in yachts of about 25 to 28 ft. racing length. In the present contest he goes up into a still larger class. It is positively stated that in deference to the wishes of the owners he has designed a centerboard craft; the question now is, how closely she resembles his famous 15 and 20-footers. It is reported that Com. Jarvis, R. C. Y. C., has ordered a design from Arthur E. Payne, of Southampton, designer of Decima, Penitent and many other noted yachts, and will build at Toronto.

The Hamilton yachtsmen have three yachts under way, with the possibility of a fourth. One is for a syndicate of the Victoria Y. C., headed by Harry Kuntz, the boat being designed by W. Burnside, who has been associated with various fast 27-footers of the fin type. Another, already dubbed a "freak," though little is known about her, is building by the Johnson Bros., under the direction of J. H. Fearnside, of the Royal Hamilton Y. C. The third is being built on speculation by James Weir. There was some talk of a new yacht at Kingston, but nothing has come of it; Com. Strange, of the Kingston Y. C., will remodel his Norma for the trial races.

Thus far the proposed contestants in the trial races of the Chicago Y. C. number four. One of these is building at Muncie, Ind., for what is known as the Whitely syndicate. Another, for Mr. George R. Pearce, of Chicago, is building by A. G. Cuthbert, at South Chicago. Another syndicate, headed by Com. F. W. Morgan, Chicago Y. C., is also building.

The Rochester Y. C. has organized a syndicate in the form of a stock company, with the following officers: Pres., Chas. Van Voorhis; Vice-Pres., T. B. Pritchard; Sec'y, J. E. Burroughs; Treas., F. E. Woodworth; Directors, Jas. S. Watson, Hiram W. Sibley, Alfred G. Wright, Fernando E. Rogers, Frank E. Woodworth, Arthur T. Hagen, T. B. Pritchard, Col. J. S. Graham, Chas. Van Voorhis. The yacht is now under construction at the shops of C. C. Hanley, Quincy, Mass. She will be of the centerboard type, in which Mr. Hanley has been so successful in Meemer, Ashumet, Acushla, etc. A crew from Rochester will take her to the lakes some time in May.

It is reported that the centerboard cutter Valiant, owned by Com. E. C. Berriman, and designed and built by F. W. Martin, in 1893, will be rebuilt to fit the new rule and class, her centerboard being removed and her iron keel replaced by lead, the ends extended and the sail plan remodelled.

Long Island Sound Y. R. A.

THE spring meeting of the Yacht Racing Association of Long Island Sound was held on March 24 at the Hotel Manhattan, New York, Mr. C. T. Pierce presiding. The following delegates were present: Park City, R. S. Bassett; Riverside, Edwin Binney and C. T. Pierce; Huntington, H. H. Gordon; Indian Harbor, Lee C. Hart and F. B. Jones; Huguenot, E. Burton Hart, Jr., and Harry Ward; Hempstead Harbor, Ward Dickson; Corinthian, of Stamford, Mansfield Toms; Norwalk, Dr. C. B. Keeler; Horseshoe Harbor, Frank E. Towle, Jr.; Douglaston, E. M. McLellan; Harlem, W. A. Towner and P. C. Sullivan; Sachem's Head, E. C. Seward; Seawanhaka, Cor. Johnston de Forest and C. H. Crane; American, H. de F. Parsons, and Knickerbocker, O. H. Chellborg and Harry Stevenson.

The following schedule of dates for the season are announced:—

Saturday, May 20—Huguenot special.
Saturday, May 27—New Rochelle special.
Tuesday, May 30—Harlem annual.
Tuesday, May 30—Indian Harbor special.
Saturday, June 3—Knickerbocker annual.
Saturday, June 10—Douglaston annual.
Saturday, June 24—Seawanhaka annual.
Saturday, July 1—New Rochelle annual.
Monday, July 3—Stamford annual.
Wednesday, July 5—American annual.
Thursday, July 6—Indian Harbor annual.
Friday, July 7—Sea Cliff annual.
Saturday, July 8—Riverside annual.
Monday, July 10—Seawanhaka trials.
Tuesday, July 11—Seawanhaka trials.
Wednesday, July 12—Seawanhaka trials.
Saturday, July 29—Indian Harbor annual.
Saturday, August 5—Hempstead Harbor annual.
Saturday, August 12—Horseshoe Harbor annual.
Saturday, August 19—Huguenot annual.
Saturday, August 26—Huntington annual.
Saturday, August 26—Douglaston special.
Saturday, September 2—Indian Harbor special.
Monday, September 4—Norwalk annual.
Monday, September 4—Sachem's Head annual.
Saturday, September 9—Seawanhaka fall regatta.
Saturday, September 16—American fall regatta.

Messrs. F. B. Jones, C. H. Crane and Ward Dickson were appointed a committee to nominate an Executive Committee for the coming year, which they did as follows, the ticket being unanimously elected: Charles T. Pierce, Riverside; C. H. Crane, Seawanhaka, Cor. F. B. Jones, Indian Harbor; E. M. McLellan, Douglaston; F.

M. Hoyt, Stamford; Stuyvesant Wainwright, American, and Charles P. Tower, New Rochelle.

The following resolution was adopted:

Resolved, That it is the sense of this Association that the eligibility to the cruising division of any yacht of 30-foot racing measurement or under that was in existence December 1, 1898, shall, in case of dispute, be passed upon by the official measurer of the Association and approved by the Executive Committee.

Resolved, further, That as the sense of the Association it is not the intention of the Association in creating a cruising division, to exclude therefrom any boat already in existence that is of a wholesome type and of seaworthy condition.

An amendment to the racing rules, providing that in Corinthian races the helmsmen must be members of organized yacht clubs. It was also decided to abandon the system of blanket entries. A special meeting will be held on April 3, of delegates from clubs giving races for the dory class.

Y. R. A. of Massachusetts.

The annual meeting of the Y. R. A. of Massachusetts, was held on March 16, the following officers being elected: Pres., A. H. Higginson, Manchester, Y. C.; Vice-Pres., Henry W. Little, American Y. C.; Sect'y., A. T. Bliss, Winthrop V. C.; Treas., I. H. Wiley, Winthrop V. C.; Executive Committee, Walter Burgess, Boston Y. C.; C. Edwin Bockus, Dorchester Y. C.; John T. Hurley, South Boston Y. C. The following dates were announced:

May 30—South Boston, open, off City Point.
June 17—Hull-Massachusetts, open, off Nahant.
June 28—Mosquito fleet, open, off City Point.
July 4—City of Boston, open, off City Point.
July 15—Quincy, open.
July 22—Burgess, open, Marblehead.
July 24 and succeeding days—Quincy challenge cup races.
July 29—Winthrop, open.
Aug. 3, 4, 5, 7 and 8—Manchester, midsummer series of open races, off West Manchester.
Aug. 9, 10 and 11—Corinthian, midsummer series, Marblehead.
Aug. 12—Corinthian, open, Marblehead.
Aug. 12—Wollaston, open.
Aug. 14—American, open, Newburyport.
Aug. 26—Duxbury, open.
Sept. 4—Lynn, open, off Nahant.

Dates for open races will be announced later by the Savin Hill and Old Colony clubs, and also by the Plymouth, Kingston and Cape Cod to complete, with Duxbury, the "South shore" circuit.

The Dominion—Yankee Match

ONE of the events of the season on fresh water will be the match between the Duggan 20-footer Dominion, of the Royal St. Lawrence Y. C., and Yankee, the representative of the White Bear Y. C. The challenge was issued by the latter club, being specifically directed at Dominion; it was accepted on Feb. 27, and a date about June 12 was agreed on. The challenging yacht is described as follows by the Mail and Empire, of Toronto:

Yankee is owned by Messrs. L. P. Ordway, George Thompson and M. D. Munn. She will be sailed by Mr. Ordway, and her crew will be Messrs. Reid, Douglas and Ramaley, all members of the White Bear Y. C. Yankee is 35ft. over all, 7ft. 8in. beam, and 6in. draft of hull, 6ft. with centerboard down. Her midship section is scow-shaped, giving her nearly 6ft. 10in. beam at load waterline. Her keel line is a true curve. She is without reverse curves in any part of the hull. The gunwale lines are slightly curved, and the bow is a half-circle. The freeboard is 13in., and the deck crowned 3in. Her displacement in racing, with crew, is about 1,900lbs. She is built with bent oak ribs over longitudinal ribs, each 8in. apart. These are framed together so as to be flush when they receive the planking. The plank is 5-16in. by 8in., single, with joints in center of longitudinal ribs. The centerboard is of steel, and weighs 200lbs. Her mainsail is long on the boom and the gaff is peaked high. Her mainsail contains about 380 sq. ft., with a jib that makes her total sail area nearly 500ft. when measured in accordance with the rules. Her sections are carefully designed so as to make her displacement curve conform with the wave line theory, when keeled to an angle, excepting that this curve was corrected so as to allow approximately for the displacement caused by the rise of water at bow and stern, when in motion. She gains on the waterline as rapidly as she is keeled, and when sailing free, uses apparently about 32ft. of her hull.

YACHTING NEWS NOTES.

Gossoon, cutter, has been sold by P. T. Dodge to T. L. Arnold, of the Atlantic Y. C., and Walter A. Peck, Rhode Island Y. C.

The sloop Sasqua, built in 1882 for Morris Ketchum by C. & R. Poillon, from a model by Philip Ellsworth, has long been known as one of the best of the type of purely American centerboard sloop. She has been owned since 1883 by ex-Com. Henry Andruss, of the New Rochelle Y. C., who has used her constantly for cruising about Long Island Sound, and as far east as the Vineyard, and has also raced her successfully in her day. She is 39ft. over all, 33ft. l.w.l., 14ft. 3in. beam and 6ft. draft, a good deal for 1882. During the past winter Mr. Andruss has had her hauled out at City Island and has removed the centerboard trunk, replacing the board with a lead keel of three tons, the greater part of the old inside ballast, the draft being increased about 1ft. 6in. A new mast has been stepped and the rig overhauled. The removal of the trunk has practically doubled the size of the cabin, giving a fine room, with wide floor and sufficient length for two berths on a side. The yacht is as strong to-day as when launched, being timbered as heavily as a working schooner, with big hackmatac knees wherever space could be found for them.

Alcedo, steam yacht, G. W. C. Drexel, arrived at Key West on March 23 from the West Indies.

The Sachem's Head Y. C. has just issued its first year book dated 1898-9. The club was organized in 1896, and

it has now a picturesque house on the rocks at Chimney Corner, Sachem's Head, Conn. The membership numbers eighty, and the fleet mustered twenty-four yachts last season, while some new ones will be added this year. The club burgee is a simple and easily distinguishable design in red and blue. Mr. W. E. Peck, 100 William street, New York, is the secretary.

The sixth volume of the Transactions of the Society of Naval Architects and Marine Engineers, for 1898, has just been published, containing the report of the last meeting, and the full text and illustrations of the eleven papers then read, with the discussions. The volumes thus far published make of themselves a large and very valuable library of technical papers relating to naval architecture and marine engineering. The book is edited by the secretary, Mr. Francis T. Bowles.

Mr. G. L. Watson has received an order for a cutter of the largest size for Mr. C. D. Rose, former owner of Satanite, Aurora and Dusky Queen. She will be ready for the season of 1900, and Capt. Sycamore will command her.

Com. Morgan presided at the meeting of the New York Y. C. on March 23. The following resolution was adopted: "Resolved, That the squadron rendezvous for the annual cruise on Aug. 7 next at such hour and place as the commodore shall designate in general orders." Upon motion, the commodore was requested to appoint a committee to draft resolutions upon the death of Mr. Richard Suydam Palmer. The committee will be named at an early day. Vice-Com. Ledyard reported that the club's charter had been so amended by the Legislature that it can in the future hold property of the value of \$500,000. The sum of \$16,000 has been set aside for the use of the Regatta Committee during the year. Twenty-three new members were elected, as follows: George W. Scott, Seymour L. Cromwell, William H. Granberry, Lewis B. Curtis, Addison G. Hanan, Henry R. Ickelheimer, John P. McGowan, M. D.; Edward Weston, George De Forest Barton, Charles E. Tilford, Daniel Bacon, Payne Whitney, Percy R. Payne, William Henry Patterson, R. C. Alexander, Joseph T. Tower, George A. Freeman, William S. Edey, C. K. G. Billings, Robert P. Doremus, W. J. W. O'Shaughnessy, Lloyd Warren, Joseph J. O'Donohue, Jr.

Articles of association were signed last night at the Morton for the formation of the Macatawa Yachting Club. The committee on subscriptions reported that about \$1,500 had been raised for the erection of a club house. This committee consists of Charles Logie, C. W. Baxter and Charles Luce, of Grand Rapids, and Charles Skates, Judge Everetts and C. B. Conkey, of Chicago. The Chicago members of the committee have assured the club that \$1,500 will be raised at that place, which will make a total of \$3,000. Of this sum the club expects to erect a club house at a cost of about \$2,500, thus keeping a reserve of \$500 for incidental expenses. The committee on organization, which consists of R. W. Irwin and H. W. Hompel, to this city, and Charles Skates, of Chicago, are to be commended for the excellent work shown in organizing the club, which has over fifty members already, with a prospect of about 150 more. The first formal meeting of the club will be held one week from to-night, when the officers will be elected.—Grand Rapids (Mich.) Democrat, March 23.

The Newport Y. C. announces the following events for the season: Tuesday, May 30, Memorial Day, club race; Monday, June 19, ladies' cruise; Tuesday, July 4, annual regatta; Tuesday, July 18, ladies' cruise; Thursday, Aug. 17, ladies' cruise; Monday, Sept. 4, Labor Day, club race; Thursday, Sept. 14, ladies' cruise. "Ladies' days" will be given the second and fourth Thursdays in each month of the season. An open race will also be given, date to be announced later. The club numbers 112 members and forty yachts.

The library committee of the New York Y. C., Messrs. Fordham Morris, Arthur H. Clark and Theodore C. Zerega, is doing good work in building up a complete and permanent yachting library that will in time be a credit to New York city, as well as to the club. The report of the committee, just issued, shows many valuable additions to the already extensive collection.

Canoeing.

A Few Stray Leaves from the Log of the Frankie.

BY THE "COMMODORE."

VII.

WE found a beautiful place for a camp across the river from the village in the shape of a long, smooth, level shelf of hard sand, a few feet above the water, beautifully shaded with a fine growth of young willows; and, although it was but 2 o'clock, we went into camp here for several days, to rest and refit and overhaul our outfit, which had been well tested by our three days' cruise.

My recollections of the three dreamy, lazy days, which drifted slowly by us as we lay here, are very pleasant ones. The long, narrow strip of sand, the rough plank fence parallel to the river, with the tented canoes strung along it in a long row; the river rippling and sparkling in front, gleaming in the sunlight through the soft, feathery plumes of the willows, with the deep, hoarse roar of the rapids above droning musically in our ears day and night; the Mac moored at the door of the big shore tent, occupied by Prof. Murray and the boys, doing duty as a tender, and pretty generally employed in taking some of the members of the party over the river or back again for water from the spring in the bank directly across from us, for little fishing jaunts, for trips over to the old tumbledown village (Porte Crayon, in a paper on Weyer's Cave, published in Harper's Magazine some years before the war, describes Port Republic as a dilapidated little village, and it has not improved to any appreciable extent since that time), for supplies or for pleasure.

The bridge was close at hand, but the skiff was so much handier, and then it was so much fun for the boys to paddle it back and forth! The heavy rain of Wednesday evening, which came upon us suddenly as we were finishing our suppers and drove us off to the shelter of our tents for the night as early as half past seven and lulled me to sleep with its soft, murmuring patter on the roof of my snug, tight little tent; the two heavy rains of the next day—Thursday—which we sat out under the trees clad in our oilskins or rubber suits, perfectly dry and comfortable; the canoe tents down, the hatches battened tightly, as the little boats lay there as impervious to the rain which splashed from their decks and collected in pellucid little pools in the hollows of the waterproof canvas aprons as so many logs of wood; the rapidly rising river after the rains, and the tramp around through the wet weeds and grass on the top of the hill behind our camp, in company with Prof. Murray and the Doctor, in search of a higher and safer site for the tents in our uneasiness lest the river should continue to rise and flood our camp (which was but 3 or 4ft. above the water) in the night, and our hard work relaying the floor in the capacious old ferry boat, which lay moored a short distance below our camp, after hitting upon the happy expedient of pitching the tents, canoes and all in it, until we discovered that the river was falling as rapidly as it had risen, when, having by this time worked some of our uneasiness off, we wisely decided to remain where we were and take our chances.

The bright, sunny, balmy day that followed this day of storms, during which we all took occasion to apply a fresh coat of oil to our tents and I paid a visit to my friends, the Scotts, living close by, who had entertained me kindly and hospitably while cruising in these waters a couple of years before; Gibbs' fall into the river while attempting to launch the Kathleen to come over and set me across the river, that coquettish craft gently but promptly slipping out from under him as he stepped carelessly in and landing him on his back in the drink, on which occasion he favored the company with a few choice quotations from the Koran as he scrambled dripping up the bank.

Perhaps the pleasantest of all is the recollection of our last night in camp here. Gibbs and I were over in town on some errand or other after a bountiful supper of bass, catfish, eels and bacon; and as we crossed the long, lofty bridge on our way back to camp, the moonlight effects on the water, with the camp-fire burning brightly on the bank and the lanterns glimmering among the trees, reflected back again from the mirror-like surface of the water, were most exquisitely beautiful, and we lingered a long time on the bridge to admire and enjoy the scene; the soft, balmy breeze from the wooded slopes of the adjacent mountains caressing our faces, and breaking the long silvery sheen of the moon in the river below into a million diamond points. A young man and a couple of young ladies from the village were leaning over the railing near us, enjoying the beauty of the scene, and they evinced great interest in the camp and the cruise. We invited them to go over with us and visit the camp, but they did not like to undertake the difficult climb down the hill across the bridge, and so declined.

In response to a prolonged blast from my hunting whistle, one of the lanterns came glimmering through the trees, with its reflection dancing along on the water, climbed up the bluff, was lost to sight, and presently reappeared at the further end of the bridge and soon joined us, in company with the Doctor, who, after we had exchanged good-nights with our companions of the moment on the bridge, lighted us down the rough, narrow path under the bridge, down the face of the steep bluff and back to our camp, where we gathered companionably around a rousing big camp-fire, smoking and talking until a late hour before we turned in for the night.

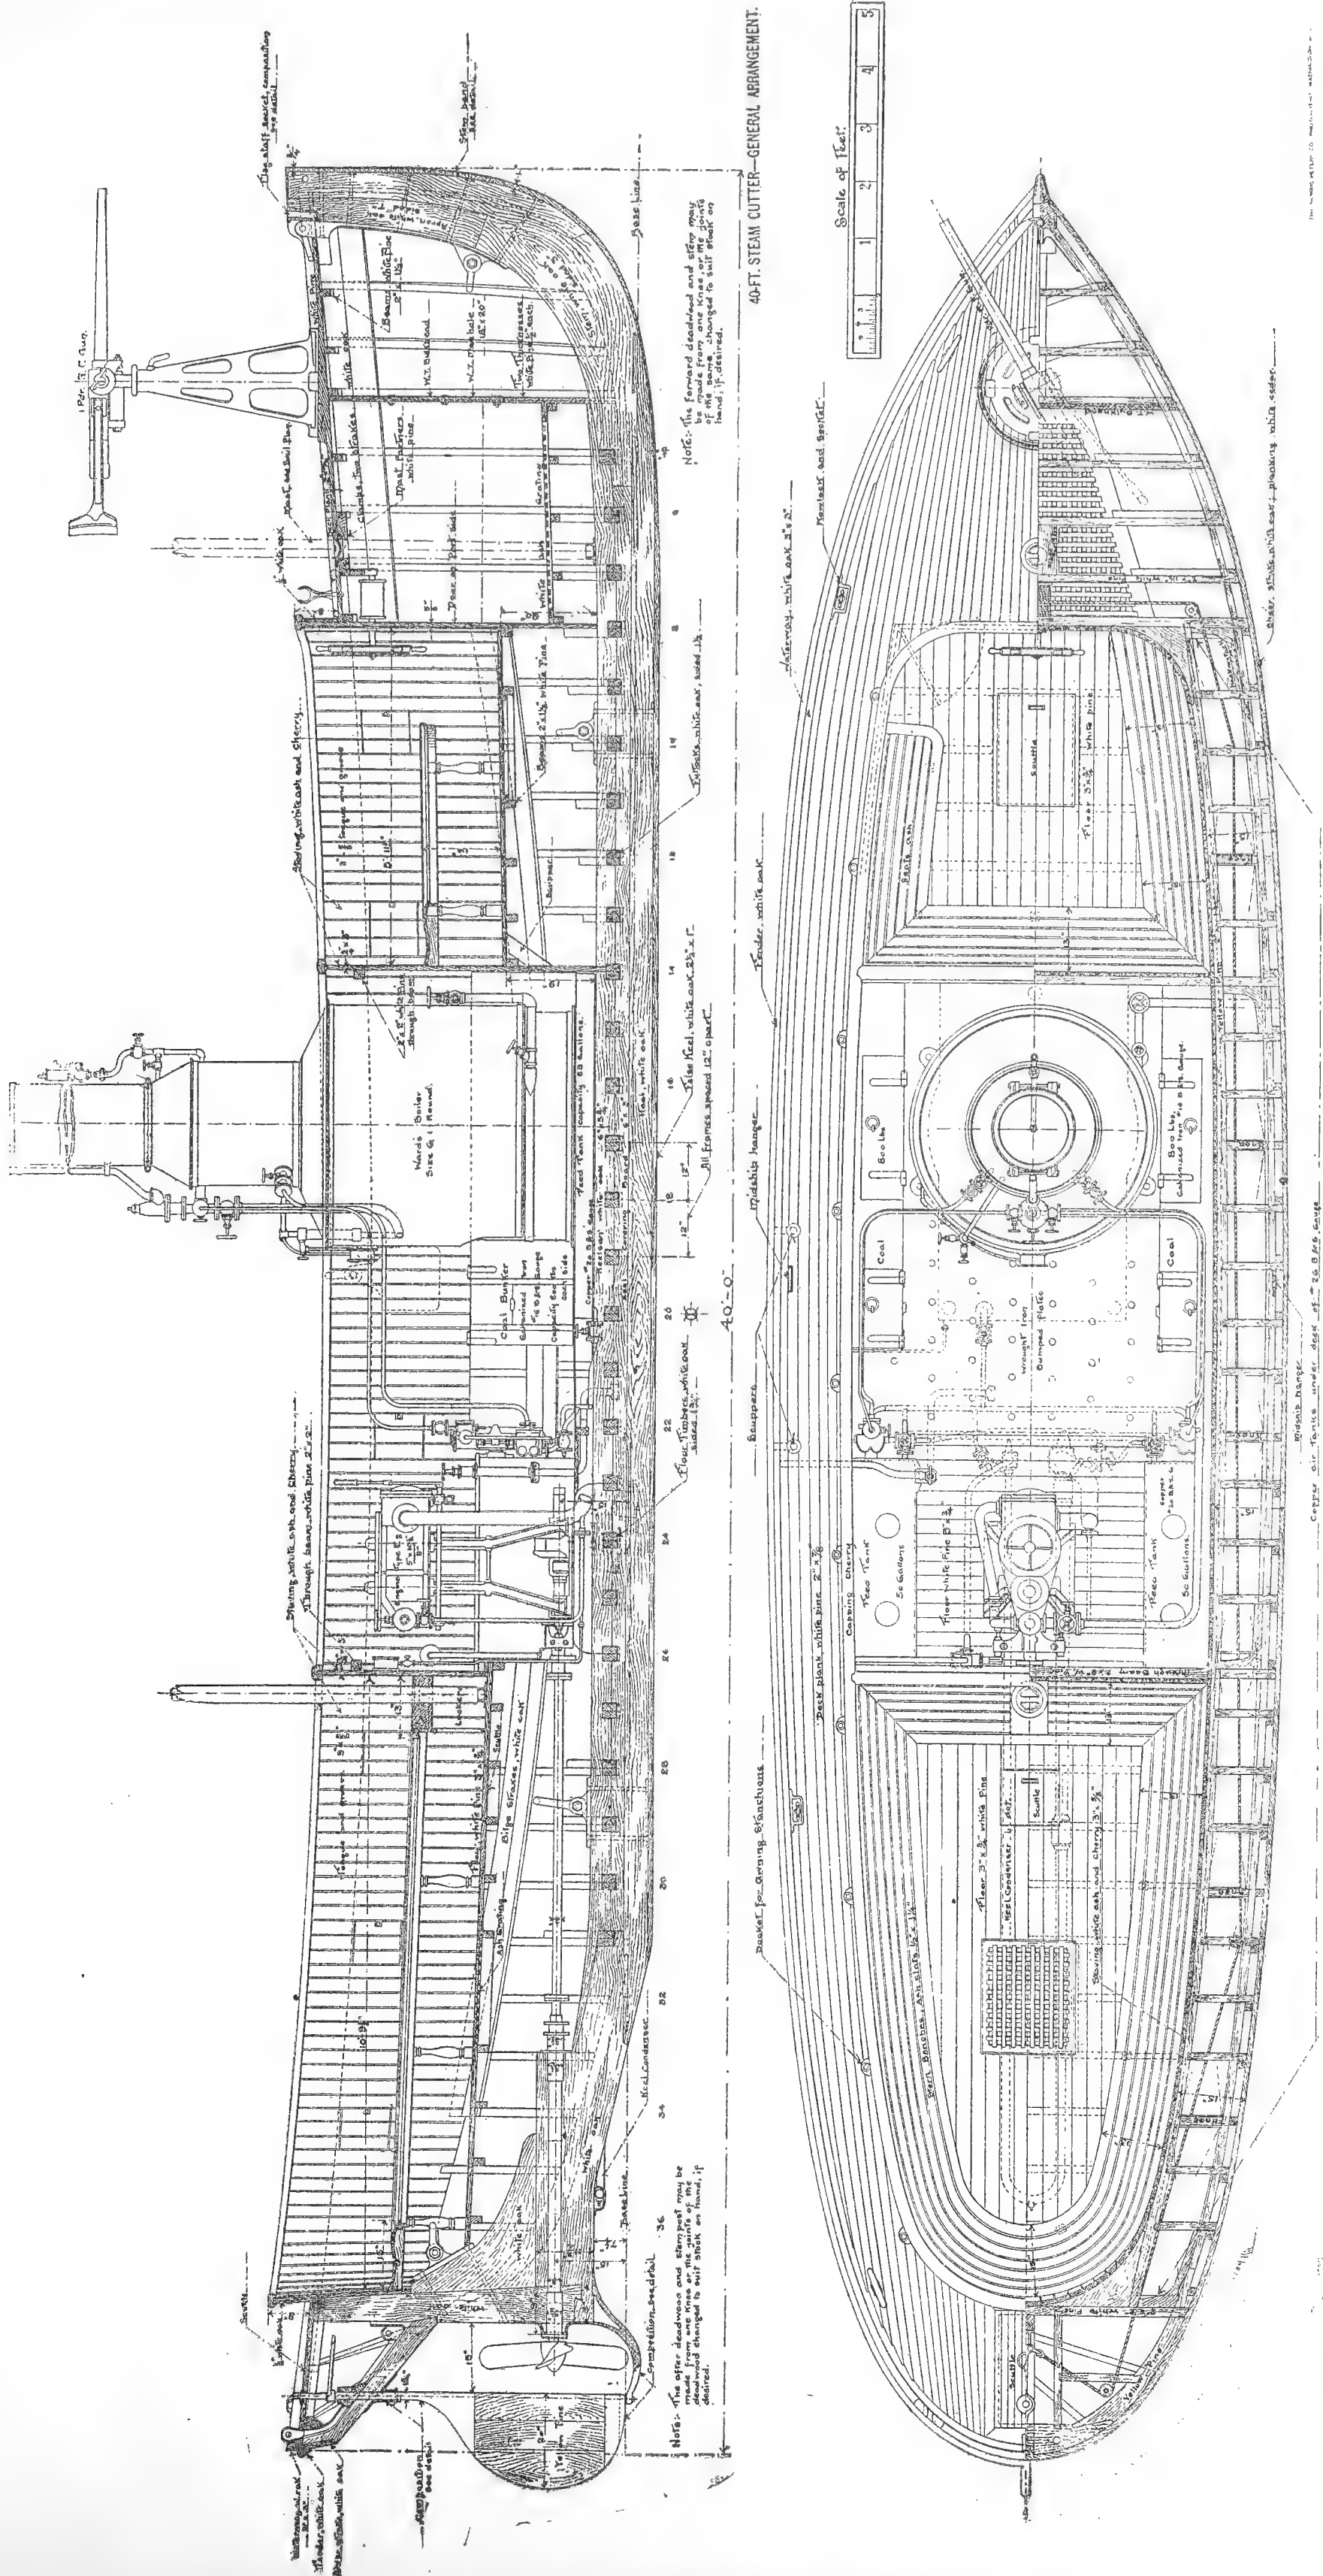

VIII.

A bright sunny Sabbath in the country! Around us nature's grand cathedral of smiling fields, leafy woods, sparkling river and majestic, cloud-capped mountain peaks, overarched by the blue dome of the heavens! The lowing of the cattle in the fields, the voices of the birds and the myriad insects and invisible, sound-producing things that go to make up the life of the forest for the choir; and the murmuring treble of the breeze through the leafy tree tops, the rippling wash of the river in front of us, and the deep-toned, heavy, dominating bass of the rapids just above us, whose white, foam-crested waves leaped and sparkled in the sun, for the organ! Who but would be impressed with such surroundings, and feel his mind and soul elevated and refreshed, as he bathed in the free, pure mountain air and the bright, invigorating sunlight that flooded and sparkled everywhere?

We unconsciously reveled in it all day as we rested quietly and pleasantly in camp. Our wet blankets, clothing and other belongings were spread out over the fences, bushes, trees and the generally adjacent country to dry and air, until it looked as if twice as many boats would never contain them all again. Letters were written to loved ones at home; plans were discussed and speculations indulged in as to the unknown river before us, its dimpled, smiling waters inviting us on. Those of us who were equal to the task brought forth shaving materials and removed the week's growth from our bronzed and sunburned faces, much to our relief and satisfaction. We were visited by Mr. Coffman and his pleasant family, among them two charmingly handsome daughters, who instantly made a profound impression on our young men, though owing to the general disreputable appearance of the party, I have grave doubts as to whether the impression was at all mutual or not, who showed us many attentions and supplied us with everything useful.

And the day drifted quietly by. The cattle in the fields, the birds and innumerable flying and creeping things in the forest, and the sighing breezes in the tree tops, the musical murmur of the river, and the deep, hoarse roar of the rapids kept up their ceaseless pastoral symphony all day long, and night came all too soon.

[TO BE CONTINUED.]

THE STANDARD NAVY LAUNCH CONSTRUCTION PLAN. See page 238, March '95.

Red Dragon C. C.

THE Red Dragon C. C., of Philadelphia, suffered considerable loss by fire to their club house at Wissinoming, Pa. on Tuesday, March 21. The fire was discovered about noon by the janitor's son. The alarm was immediately given, and every effort made to save the property. Owing to a tin roof covering the house, the flames made slow progress, but the rooms on the third floor were entirely gutted and considerable loss incurred before the fire department succeeded in extinguishing the flames. The individuals occupying the rooms on the third floor carried insurance, which will cover their loss. The damage to the property will amount to nearly \$1,000, which is also covered by insurance.

The trap-shooting match between the gun club of the Red Dragons and the Philadelphia Y. C. was carried out as originally arranged on March 25.

Com. Murray is working hard to place the Red Dragons in a more prosperous condition, and the repairs to the interior of the club house, when completed, will make it an ideal home for a canoe club. The recent fire will not affect this, as little damage was suffered by the lower portion of the building.

The series of talks to the club members upon "Accidents and Emergencies," by the fleet surgeon, Dr. F. O. Gross, ended on Wednesday evening, March 22. These talks were of unusual interest and value, and were remarkably well attended. After the last talk Com. Murray, in behalf of the members, presented Dr. Gross with a handsome gift in appreciation of his generous services.

The boating season is now drawing near, and soon the guns and traps will be laid aside and the canoes, half-raters and launches placed in commission. The prospects for a prosperous summer season is very encouraging, and unusual interest is already being shown.

W. K. P.

Rifle Range and Gallery.

Conlin's Tournament.

CONLIN'S Jubilee Tournament, at the old stand, Broadway and Thirty-first street, New York, was concluded on March 25, with the following winners. Rest rifle match: First, J. W. Christiansen; second, J. T. B. Thomas. Rapidity and accuracy match: First, Geo. I Hermann; second, Peter Denise; third, F. E. Haynes. Pistol match: First, F. T. B. Collins; second, T. H. Keller; third, W. J. Clark.

The outdoor shooting of the Zettler Rifle Club, at the 200yds. range, will begin in April. At the weekly shoot on March 22, at the indoor range, off-hand shooting, 50 shots each man, ring target, 75ft., possible 1,250 points, the scores were: L. P. Hanson 1,224; Fred C. Ross and Michael J. Dorrier 1,212 each; W. A. Hicks 1,203; Charles G. Zettler, Jr., 1,199; C. G. Zettler, Sr., 1,189; Henry Holges 1,183; Renhold Busse 1,151; Jacob Schmitt 1,174; S. W. Benton 1,171; S. O. Buzzini 1,164; Barney Zettler 1,156; T. H. Keller 1,142; Henry Muenz 1,126; Thomas P. McKenna 1,106.

The Smith & Wesson gallery in the north side of the main floor at the recent Sportsmen's show was the center of attraction to lovers of displays of skill with revolver and pistol. The gallery was neatly fitted up, and in a case, was a fine exhibit of the famous products of the Messrs. Smith & Wesson. Mr. C. S. Astell, the expert, was in charge, giving exhibitions, Mr. C. Smith participating, and bullseyes and centers were so common that missing the bullseye seemed to be the real marvel.

Trap-Shooting.

DRIVERS AND TWISTERS.

A new arrival in town last Monday was Jim Elliott's "little brother" Dave from Kansas City, who is the advance guard of a strong delegation of Grand American Handicap candidates from that sporting city. Mr. Elliott, who, by the way, is now practicing on live birds, along with J. A. R. down at Easton, Md., mentions the following as having their eyes on first money and the cup in the G. A. H., all hailing from Kansas City, Mo.: Messrs. Chris. Gottlieb, Ed Hickman, George Cockrell, J. E. Riley and E. Branch-hall. Eastern shooters will extend a warm welcome to this bunch, none of whom have ever taken part in any Grand American Handicap.

Paul North, of Cleveland, O., and of magautrap fame, is one of the entries in the Grand American Handicap. In making his entry, Mr. North wrote to the secretary of the Interstate Association in the following strain: "It is rather hard that so many men who have been trying for several years to win the Grand American Handicap and who have failed, but who will try again this year, should be disappointed. Thus, writer, who has never shot in it before, will win it this year. Such things will occur." It is hoped that this statement of Mr. North's will not keep many away. Second money is well worth winning.

The exposure to the weather during the two weeks' tournament on Madison Square Garden roof was too much for Elmer Shaner and for "Brother Bill" McCrickert, the well-known squad hustler of many Grand American Handicaps. Mr. Shaner has been quite ill, but is now well on the road to recovery; "Brother Bill" was kept in bed several days with an attack of sciatic rheumatism; he, too, is understood to be convalescent, and to have retained his full lung power unimpaired.

Jack Fanning writes from the Coast in good spirits, although at the same time lamenting that he has not been shooting quite as well as he usually does. Too much sight-seeing and hand-shaking must have had its effect on Tom Sharkey's nerves, for he does not often lose a live bird. He will be on hand at the Grand American Handicap, and will try to overcome that hoodoo of "all but one, and that dead out!"

Under date of March 27, Mr. H. A. Penrose, Baltimore, Md., writes us: "I see in 'Fixtures' that you have only claimed from the 18th to 22d for our tournament. Please be kind enough to change same, claiming the entire week, as we have had inquiries from so many live-bird shots who are going to attend that we have decided to have live-bird shooting Monday and Saturday, which will be April 17 and 22; the other four days will be devoted to target shooting."

Louis Harrison, of Minneapolis, wants to know where he is at. Our Western cotemporary in its recent issue stated that he "was in Chicago last week, Saturday, visiting old friends." As a matter of fact, Mr. Harrison has not been out of Brooklyn, N. Y., having been confined to the house with a bad cold for the past few weeks. He has now recovered, and will be seen at the traps this week.

The Hunters Arms Co., Fulton, N. Y., have manufactured a gun of special elegance for Miss Annie Oakley, and to her order. It has a fine pair of chain Damascus barrels. On the right lock a portrait of the owner in stage costume is engraved, and on the left her portrait, familiar to all shooters. Inlaid in gold on the guard is Miss Oakley's name in full.

John Wright, of the Brooklyn, N. Y., Gun Club, says that his club's shoot last week was so successful, that he will get up another, and run it shortly after the Grand American has come and gone. He states that he will again choose the Lyndhurst Shooting Association grounds as the scene of the shoot.

Mr. S. M. Du Val, secretary-treasurer of the Milwaukee Gun Club, under date of March 27, writes us as follows: "The Milwaukee Gun Club will hold a grand tournament during part of the Milwaukee carnival week; date of tournament, July 1 and 2."

We regret that Mr. Louis Erhardt, of Atchison, Kas., well known and highly esteemed by all, is seriously ill. We hope to learn of his speedy recovery.

POMPTON LAKES, N. J., Feb. 20.—This table is intended for clubs where the average percentage of each member is known or can be accurately approximated. In order to explain the table, let me give you an example.

Suppose two men are shooting at any number of targets, say, for instance, 25. Now, let one man's average be 80 per cent., and the other one's 60 per cent. Of course the man with 80 per cent. to his credit is the better shot, and should allow the other one a certain number of extra targets. Now, take the table and run along the top line of figures till you get to 80, and then drop down this column till you get to the line that commences (on the extreme left) with 60. This will give you the figure 33.2. This figure represents the percentage of extra targets that the 80 per cent. man should allow the 60 per cent. man to shoot at. If they are shooting at 25 targets the 80 per cent. man should score 20 of them. The 60 per cent. man has 25 targets, plus

E. A. WHISTLER EVERITT.

Under date of March 20, in a personal letter, Mr. Herbert Taylor, one of the Association directors, writes as follows: "The amateurs, I hope, will turn out in such numbers at this tournament, and be so well satisfied with our programme that other tournaments will adopt a similar plan. The twenty acres of the Du Pont Park is slightly rolling; it has a creek running through it. We have straightened this creek and will use the old bed of the stream for our target pits. This will do away with the necessity of a blind. Each trap will be placed on top of a 6in.x6in. post, set solid in the ground, with shelves behind for the targets. The ground on both sides of the creek is level, with a perfectly clear sky for background. Two sets of traps will shoot to the Northwest; the third will point a little to the Southwest and will be difficult shooting late in the afternoon, on account of the sun, but we do not hope for such a large attendance that will compel the operation of three sets of traps all day long. The only novelty to the average shooter will be the absence of a screen; this may throw him off for a time on account of the target being visible from the moment it leaves the trap."

From the St. Louis Globe-Democrat we take the following: "Considerable interest is already developing in the trap-shooting tournament of the Missouri State Game and Fish Protective Association, scheduled to be held in this city in May. It is the first pretentious tournament projected in St. Louis in many years, and the success of the city in securing the tournament was largely induced by the splendid scores of the St. Louis marksmen, who won the principal team trophy and broke the world's record at Kansas City last spring. To make this interest as widespread as possible, quite a number of St. Louisians will attend and take part in the Great American Handicap tournament, to begin at Elkwood Park, Lakewood, N. J., next month. Among those are Dr. Smith, who has shown a high standard of work during the past year; Sumter, Bert Taylor and probably Billy Nold. Frank Stockton, of Hannibal, who shoots a lot here, will also accompany the party, which will join hands with the Chicago shooters and go East in a special car."

Live-bird shooting is lively in every section, the forthcoming struggle at Elkwood Park stimulating the gladiators to get into their best form. At Watson's Park, Burnside Crossing, Ill., John Watson is flying birds quite regularly; those of his famous brand, with his trade mark blown in every bird. They are not easy to kill. On March 23, in a very strong wind, Fred Gilbert killed 28 out of 30. Mr. Feigenspan killed 45 out of 50. Gilbert on March 24 killed 22 out of 26. On March 22, C. B. Dicks and Jim Stuart, in a 50-bird match, killed 41 and 46 respectively. The wind was straight out, and the ground was covered with snow, and it snowed through a part of the race. The birds were mostly right and left-quarterers, and very hard to see. Two team races were shot on March 21, between S. Palmer and E. S. Rice on one side, and J. Stewart and Fred Gilbert on the other. First race, Palmer 21, Rice 18; total 42. Stewart 20, Gilbert 23; total 43. Second race, Palmer 22, Rice 19; total 41. Gilbert 24, Stewart 25; total 49.

Tom Morfe provided some excellent birds for the guests of the Brooklyn Gun Club to shoot at last Thursday, March 23. It is a pity that the wretched weather of the previous day and of the early part of the 23d stopped so many shooters from going to the Lyndhurst, N. J., Shooting Association's grounds. Had they braved the weather, they would have seen as good a lot of birds as were ever trapped, and have enjoyed the fine afternoon. As it was, there were about a score of shooters present, and only one, Capt. A. W. Money, was able to kill 15 straight in the main event.

Oscar Hesse, of Red Bank, N. J., defeated Harold B. Money in the match for the New Jersey target championship, and took the E. C. cup home with him to his residence by the sea. Mr. Hesse represents the Walsrode powder interests in this country, and was naturally more than pleased at the result of the match. He is not to have undisputed possession of the title and the cup for long, for immediately after the match, he received a challenge from Capt. Money, and equally promptly accepted it, promising to name date and place in a few days.

Admiral A. G. Courtney was a visitor at the Brooklyn Gun Club's shoot last Thursday, March 23. He was accompanied by U. M. C. Thomas, Rolla Heikes and John J. Hollowell, so the Remington-U. M. C. aggregation was well and strongly represented. After the shoot the Admiral sailed for Syracuse; Rolla Heikes and Hollowell left for Philadelphia, and U. M. C. took the train for his bailiwick on the north shore of Long Island Sound.

W. Cashau and R. L. Packard, both of this city, are matched to shoot quite a sporting race. The former stands at 30yds.; the latter at 28. The event is to come off on Thursday of this week, March 30, and is at 50 live birds per man, for a stake of \$500 a side. This sounds tall, but a forfeit of \$100 is already in the hands of a stakeholder. The match will be shot at Morfe's, Lyndhurst, N. J., and nothing but the very best birds will be trapped for the occasion.

Entries for the Grand American Handicap—that is, regular entries—close on April 4, Tuesday of next week. Secretary Edward Banks informs us that the entry list is swelling very rapidly, and that the number of new men to the Grand American Handicap is something astonishing. He confidently looks for 250 entries, and perhaps more. The man who wins out in such a crowd may well be proud of the handsome cup he will have thoroughly earned.

On April 5, at Singac, N. J., commencing at 12 M., there will be a 25 live-bird handicap, 24 to 32yds., \$10 entrance, birds extra. Mr. Arthur Bunn, Singac, N. J., is manager. All entries must be sent to him, each one with \$5. Sweeps will follow the main event. Trains leave Chambers street at 10:30 and 12 o'clock for Little Falls. Electric cars from Erie Depot at Paterson to Singac. Stages meet all cars.

At Frenchtown, N. J., March 22, John Rehrig, of Leighton, Pa., defeated George Cubberly, of Yardville, Pa., in a match at 50 birds per man, \$100 a side, cost of birds to be paid by the loser. The scores were low, 39 to 34. Cubberly defeated Rehrig in a match at 25 birds, March 9. Same day and place George Page, of Trenton, N. J., tied with J. Warford, of Frenchtown, in a 10-bird match, each killing 6.

In our columns elsewhere is a diagram of a target and live-bird grounds, designed to give the most economical results in the space usually devoted to one or the other of the specialties of trap shooting; that is, live birds or targets. The diagram has the necessary explanatory matter printed upon it. The whole is designed by the famous trap shot Mr. E. D. Fulford, of Utica, N. Y.

Rolla Heikes is shooting live birds well, and says that nothing less than "25 straight" will satisfy in the G. A. H. He is liable to do it too. He got there last year, and he means to be the exception to the rule, showing that lightning does some time strike in the same place.

an extra allowance of 33.2 per cent. of 25, or a total of 33.3 targets. Now, if he shoots his average gait he will score 60 per cent. of this number, or 19.98, practically 20, thus tying the score of the 80 per cent. man.

On the same principle, a 90 per cent. man would allow an 80 per cent. man 12.5 per cent. more targets to shoot at, and so on. You will notice that this table is intended to put the good and the poor (no insinuations intended) shooters on a footing such that if each man shoots his average gait the number of targets scored by each man will be the same. Of course if a man shoots more or less than his average, he will win or lose, as the case may be. I am aware that this matter is by no means new, and possibly some one has devised a system long before this; but this table seems so simple (and is theoretically correct) I offer it for criticism.

A pleasant companion and a gentlemanly shooter, who has been shooting in various matches around New York during a number of weeks under the shooting name of Dr. Douglas, left for his home in Wyoming last week, much to the regret of the many friends who learned to esteem him in his too short stay. May he join us again soon.

It is understood in shooting circles that Neaf Apgar will shortly shoot Du Pont powder and do his best to serve the interests of the manufacturers of that powder at all the shoots in and around New York for the next twelve months. It will be quite familiar to see the southpaw Jerseyman facing the traps once more.

On March 31 Mr. Geo. B. Bliss, Stamford, Conn., informs us that there will be an all-day shoot, the magautrap recently used at the Sportsmen's Exposition tournament serving to throw the targets. The shoot is open to all. The main event is a ten-men team race, with the White Plains Club.

Messrs. Harvey McMurchy and S. A. Tucker participated in a live-bird shoot of the Olympic Gun Club, San Francisco, not long since. McMurchy killed 24 straight, 12 in the club event and 6 in each of two other events. Tucker killed 10 in the club event, losing one dead out.

A new gun club, the Kingsbridge Gun Club, has been formed at Kingsbridge, N. Y. It purposes to hold a live-bird and target shoot on the second Saturday of each month. Mr. B. H. Norton, of the Hazard Powder Co. is one of the chief promoters of the organization.

Rolla Heikes and Jim Elliott are still circulating somewhere in the vicinity of New York, but there is very little, if any, talk of a match at either live birds or targets between these two good shots. Something of the kind would live up matters considerably.

Harold B. Money and W. Cannon, the one-armed shooter, of Newark, N. J., are matched to shoot a race at 100 live birds per man, for a consideration, but no date has as yet been set for the match.

On April 6, Smith Brothers' grounds, Foundry and Ferry streets, Newark, there will be an open shoot at 20 or 25 live birds, commencing at 11 o'clock. A wagon will meet the car. Automatic traps.

On Thursday of this week the Riverside Gun Club will hold a handicap shoot at 25 live birds, \$10 entrance, at Riverside Hotel, Carlstadt, N. J., commencing at 12 o'clock.

The return match between the Oceanic Gun Club and the Hudson Gun Club has been postponed to April 17.

BERNARD WATERS.

Pawling Rod and Gun Club.

DOVER PLAINS, N. Y., March 26.—Herewith are some complete scores of our tournament. We shot through the programme twice and ended with some miss-and-outs at \$1 apiece, at which nobody got hurt. Elliott and Tallman shot at 9 in 10-bird events; 13 in 15-bird events, and 17 in 20-bird events, after the four rounds of extra events. I wish to claim the date of July 4 for an all-day shoot at targets. Liberal programme; also I am going to try and arrange to run a two-day affair Oct. 6 and 7; first day at targets and second day at live birds. We will hold this on the Pawling Fair grounds, which has large club house and perfectly fitted for a big affair. All income and surplus of our shoots go toward stocking streams with trout and the fields with birds, and this should appeal to all true sportsmen to help along the good work. I claim date thus early so that other clubs will not conflict with us.

No. 11 was at 10 pairs.	No. 12 was the merchandise handicap:												
Targets:	10	15	20	10	15	20	10	15	20	10	20	Av.

H. NELSON.

Auburn Gun Club.

AUBURN, Me.—At the annual meeting of the Auburn Gun Club, March 25, the following officers were elected: President, O. L. Barker; Vice-President, H. A. Fletcher; Treasurer, C. E. Conner; Secretary, L. A. Barker. Executive Committee: O. L. Barker, H. A. Fletcher, C. E. Conner, L. A. Barker, A. C. Wills. Handicap Committee: L. A. Barker, H. A. Fletcher, F. E. Francis.

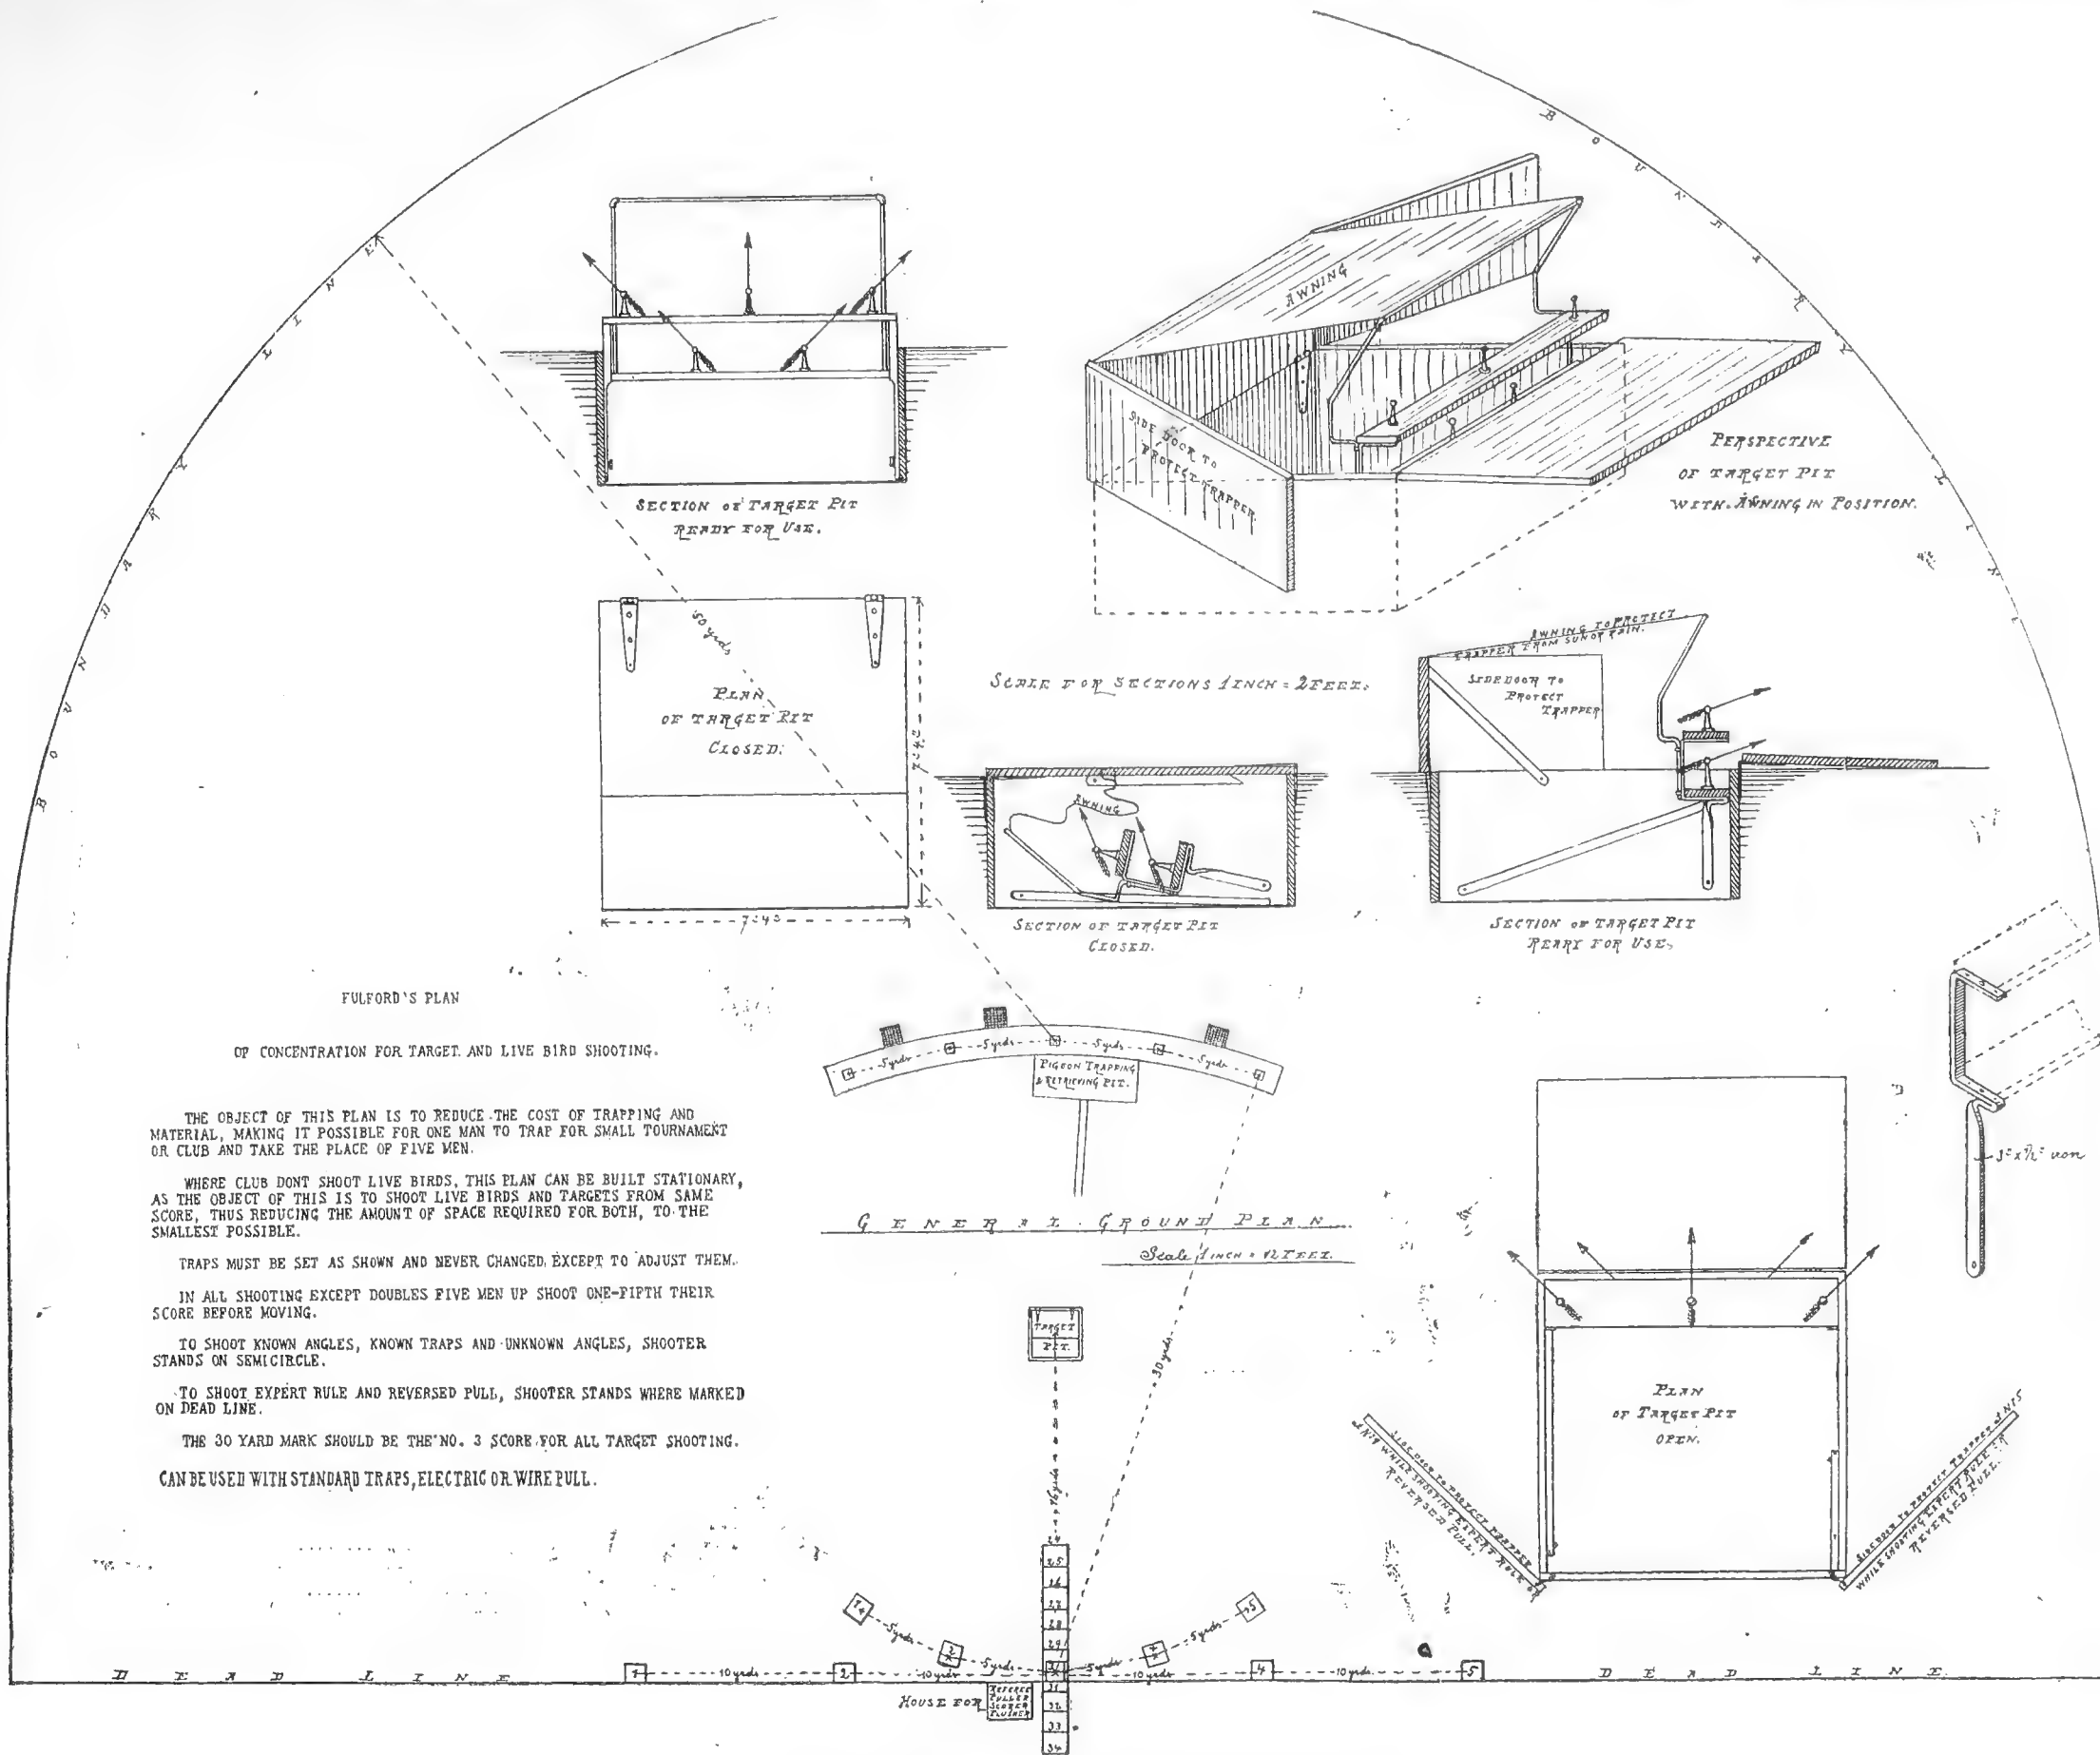

The club had a very successful season for '98, having an increase of 26 new members and a good balance in the treasury. A fine gold badge will be secured and shot for during the season of '99 under a handicap system, 25 targets with an allowance of from 1 to 8 targets. We sent two teams of five men each to the State tournament at Waterville, Aug. 30 and 31 and landed the State championship by a score of 219 out of 250, thus bringing the State shoot to Auburn for '99.

We are negotiating for new grounds within three minutes' walk of the electric cars, and if they are secured, will build a fine two-story club house on them. The badge shoots will be held every Saturday afternoon. Four fine Parker trap guns arrived last week, and there was much rejoicing among certain members of the club.

On Saturday afternoon six of the boys went out to the grounds to trap the new guns. After some difficulty the trap house was located in a snow drift 8 or 10ft. deep, and it was a case of dig before any shooting could be indulged in. As the boys overexerted themselves, the scores were not very large, but the new guns are all right, and will be heard from later.

Our second annual tournament will be held the last of May, or first of June.

L. A. BARKER, Sec'y.

FULFORD'S PLAN OF TRAP ARRANGEMENT.

Boston Gun Club.

WELLINGTON, Mass., March 24.—The second last date of spring series was unfavorable in the extreme for trap-shooting, and with so many of their selected dates murdered by the weather clerk, the Boston Gun Club have come to the conclusion that they have a right to complain. The second half of series have alternated between wind, hail, rain and snow, and the promise of improvement over good scores of first half has not been fulfilled.

To-day was so very rainy that it would have occasioned no surprise had not a shooter attended, yet eight came out by the first train and shot until 5 o'clock, with but one recess for the trappers to dry out. Such devotion to the cause was worthy of better success as regards scores, but the targets were hard to find, and not a straight appeared on the score sheets of afternoon. A 21yds. and two 17yds. shooters divided honors in the individual match; in the team event Leroy and Dennison had a walkover.

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	10	10	6	10	10	5	6	10	10	12	10	10

Centredale Gun Club.

PROVIDENCE, R. I., March 25.—Editor Forest and Stream: I was very much surprised upon reading an article about the Centredale Gun Club, in your issue of to-day. For what reason it was written would perhaps seem a mystery to most persons, but those who are aware of the condition of trap-shooting in this vicinity last season can easily see the motive. I may be mistaken in my opinion, but many of my friends will bear me out that the general tone of the article seems to cast a slur on our club, in a very sarcastic manner. It is all a contemptible falsehood, as we had no shoot on March 11. It is plainly evident that the gentleman (?) who wrote it, is very jealous of the success of our club in the past, and its bright outlook in the future. We do not care to brag, but we can truthfully say that we have a good clean record, and don't owe any bills. If our club has ever done anything which might occasion a person to harm us, why don't he come out like a man and say so, and not try to do it in such an underhanded, cowardly manner, and then we could answer for ourselves.

The members of our club are mostly new shooters at the trap, but they are trying their level best to increase interest in trap-shooting in this State, and for that reason, if for no other, they deserve to be used better than that.

Our programme for the season of 1899 is as follows: The opening shoot of the season takes place on Saturday, April 1, and will continue every Saturday afternoon until Oct. 1. Special shoots on all legal holidays throughout the year. A 25-target, unknown angles, handicap event to be shot for every two weeks, beginning April 1, and ending Sept. 30, under the following conditions, will also be held. On April 1 shooting will commence at 10 A. M. Entrance fee, price of targets. Targets 1 cent each. Winner of each shoot receives 5 points; second, 4 points; third, 3 points; fourth, 2 points, and fifth, 1 point. The person having the most number of points at end of season will receive a beautiful gold medal, suitably inscribed; second highest, leather gun case; third highest, hunting suit (coat and pants); fourth highest, shooting blouse; fifth highest, 100 loaded shells; sixth highest, Power's cleaning rod; seventh highest, 50 loaded shells. Open to any Rhode Island resident shooter. There must be at least five entries, otherwise it will be postponed until next regular shoot. Handicaps from 1 to 10 targets extra to shoot at. Handicaps will be changed at the end of every fourth shoot. Entry must be made at least three days before the first shoot with the secretary. The dates of the handicaps are as follows: April 1, 15, 29, May 13, 27, June 10, 24, July 8, 22, Aug. 5, 19, Sept. 2, 16, 30. Team shooting will also be encouraged by having two shooters choose sides on handicap days. Intervening Saturdays shooters can avail themselves of practicing. Shooting will commence at 2 P. M. It is hoped that every shooter will avail himself of the opportunity and enter every event.

We now have five expert traps in conjunction with the magatrap. N. F. REINER.

The Pawtuxet Gun Club.

PAWTUXET, R. I., March 23.—Editor Forest and Stream: In the issue of FOREST AND STREAM dated March 25 I notice a communication signed Centredale, in which there appears some rather strange statements, or rather misstatements, which evidently need correcting. At different times this winter there have been similar effusions, evidently emanating from the same source, in the Providence daily papers, which we did not think it necessary to notice, but as the FOREST AND STREAM is a recognized sportsmen's organ, perhaps a statement of a few plain facts would not be out of place. Our friend Centredale seems to be either laboring under an unaccountable hallucination or else to be badly affected with moral strabismus, and in either case should be set right if possible. While it is certainly encouraging to know that 64 shooters faced the traps, it would be perhaps more interesting to hear how many actually took part in the shooting. The paragraph, however, to which I especially wish to reply is this: "The Centredale is now composed of all the best shooters in the State of Rhode Island, as the Providence and Pawtuxet gun clubs have disbanded, and the members joined the Centredale, making a membership of 74." Now, we are, of course, glad to know that the Centredale Gun Club is doing so well, but what puzzles us is who Centredale is, and where he gets his information about the Pawtuxet G. C. The facts are that the Pawtuxet Gun Club has not disbanded, has never thought of disbanding, and also has a membership of exactly 74, including some, if not all, the best trap shots in the State. We also hold the championship pennant, representing the five-men team championship of the State, for which, by the way, we have not as yet received any challenge from the Centredales, although holding it over a year. We shall open as usual in April, and hold fortnightly shoots for badges, etc., of which, with your consent, due notice will appear in these columns. In the meantime I would request that no notice of any news pertaining to the Pawtuxet Gun

Club will be noticed by you unless signed by some officer of the club.

W. H. SHELDON,
Vice-President Pawtuxet G. C.

Trap around Reading.

READING, Pa., March 25.—Fen Cooper, of Mahanoy City, and Harry Coldren, of this city, will meet on Friday, March 31, to shoot the second of a series of three matches. This match will be 100 live birds per man, for \$100 a side, Hurlingham rules to govern. The match will be shot at the Three-Mile House, commencing at 1:30 P. M.

March 23.—Arrangements are being made to have Coldren meet Clouser, of Gibraltar, at the Three-Mile House, for \$100 a side, each man to shoot at 100 live birds, 28yds. rise, American Association rules to govern. The date has not been selected, but it will probably be the week after the Grand American Handicap.

Boyetown, Pa., March 22.—A largely attended live-bird tournament took place to-day on the grounds of the Boyetown Rod and Gun Club, of this place, when the following events were shot:

Events:	1	2	3	4	5	Events:	1	2	3	4	5
Targets:	10	5	5	*10	10	Targets:	10	5	5	*10	10
Benner	8	6	Shuler	4	5	4	7
W Wien	9	5	Trumbauer	4	5	4	9
Buckwalter	9	5	5	4	9	Emmers	4	5	4	5
Nuss	6	4	4	4	9	Lenhart	4	4
Davis	2	5	1	..	H Wien	6
Schaffer	9						

*Miss-and-out. Mahanoy City, Pa., March 22.—Fen W Cooper, of this city, hereby challenges Harvey Clouser, of Gibraltar, Pa., to shoot 50 or 100 live birds, for \$50 or \$100 a side, either Rhode Island or Hurlingham rules to govern, or Cooper is satisfied to shoot Clouser 100 live birds, Hurlingham or Rhode Island rules, loser to pay for all birds, and winner to take entire gate money. Cooper can be addressed, care of Opera House, Mahanoy City, Pa.

Cooper is also willing to shoot Midgey, of Reading, a 50 or 100-bird race for \$100 or \$200 a side.

Pottsville, Pa., March 23.—At Bossler's Seven Stars Hotel, near here, a sweepstake live-pigeon match was shot to-day. There were nine entries, each man to shoot at 7 live birds. Daniel Walkner, of St. Clair, won, killing 6 out of 7, while John Schoenbutts, of Pottsville, won second money with a score of 5 killed. A. E. FINKE.

Palm Beach Gun Club.

PALM BEACH, Fla., March.—A private match, \$25 entrance, 100 targets, all standing at the same distance, was shot here, with results as follows:

Wilson, 11	10	11	10	10	11	11	11	10	10	11	19
Cook, 10	11	10	11	11	10	11	10	11	10	11	20

Cook, 11	11	10	11	10	11	11	10	11	10	11	20

Sweepstake at 25 targets:
Dr Kaisner, 11
Wilson, 10
Jones, 11
Wm. Dietsch referee, Mr. Sanders scorer.

IN NEW JERSEY.

Oscar Hesse wins the Jersey Championship.

March 25.—After holding the New Jersey inanimate target championship for just four weeks, Harold B. Money handed the title and the E. C. cup, emblematic of the championship to Oscar Hesse, of Red Bank, N. J., who represents Walsrode powder in this country.

The match was shot on the grounds of the Boiling Springs Gun Club, at Rutherford, N. J., the conditions being 50 targets, unknown angles. There was a bad light and the targets were thrown exceedingly hard and fast; in fact, the conditions were such that good scores were next to an impossibility. Harold Money started in like a winner, scoring 18 out of his first 19; then he lost, in quick succession, his 20th, 21st, 24th and 25th, going out with 20. Hesse lost four targets out of his first 15, but broke all of the last 10 in the first string save one, thus tying Harold Money's total of 20 for the first 25.

The surprise came in the second half of the match. Money lost just 10 out of the first 20, and also 2 out of his last 5, scoring 13 out of the 25, and making his total for the 50 only 33. Hesse scored 18, distributing his misses equally, but won out with 38 to 33. During the match Harold Money seemed to lose his time, getting quite slow at times, and save in the first 20 targets, did not at any time show anything like his usual good form.

After the match the winner was challenged by Capt. A. W. Money. The date and place for this match will be fixed later.

Scores:

East Side Gun Club.

Newark, N. J., March 24.—The East Side Gun Club's two-days' shoot, which was held on the Smith Bros.' grounds, Foundry street, ended to-day with a 20-bird event, in which three men tied for first place. The events on the first day were at 10 birds, 28yds, rise, and at 7 birds, 28yds. To-day's event was at 20 birds, \$10 entry, 28yds. rise. The weather was raining in the forenoon, but cleared off later. A stiff north wind and good birds made hard shooting. Scores:

Hansmann 11 15
Boothroyd 12 7
Geotz 7 4
Oraw 7 4
THOS. KELLY, Sec'y.

Brooklyn Gun Club.

Lyndhurst, March 23.—There was an enthusiastic crowd of famous shooters at the Brooklyn Gun Club's live-bird shoot on the grounds of the Lyndhurst Shooting Association, Lyndhurst, N. J., to-day. The weather was most unfavorable and most unpleasant in the morning hours. The sky was darkly overcast and forbidding. The temperature was raw, and there was a general badness of weather such as would justly spoil the chances of any ordinary shoot. Nevertheless, the shooters came in groups till there were as many as could shoot in the programme.

There were some doubts expressed as to the birds; that is to say, it was supposed that some of the birds would either be calmly contemplative after the traps were opened or would peck tentatively into the ground on the chance of potting a stray worm, but the birds contributed their share, with a bit to spare. In short, they were a corking lot of fast, strong birds, which flew with the most vigorous determination and died with discouraging reluctance, so much so, indeed, that many of them, most inconceivably, it is true, died out of bounds. Any man who imagines that he can admire the planetary system and at the same time kill some of Tom Morfe's good birds would only need to try them to learn that they are a distinct specialty which require the closest attention and the most perfect execution in using the gun.

Mr. John Wright, managed the shoot.
The scores, considering the quality of the birds, were excellent. Had there been a stiff wind undoubtedly there would have been an appreciable cutting down of them. As it was, out of the eighteen competitors in the main event, Capt. Money was the only shooter who killed 15 straight in the main event. Heikes, who was scratch man alone at 31yds., killed 14, in company with Longcake and Martin.

No. 1 at 5 birds, \$3, birds included, three moneys, class shooting, had fourteen entries. No. 2, at 15 birds, \$10, birds included, four moneys, class shooting, handicaps from 26 to 32yds., had eight entries.

The miss-and-outs were \$2, birds extra at 25 cents.
No. 1, 15-bird race, \$10 entrance, four moneys, class shooting, handicaps 26 to 32yds.:

Rochester Rod and Gun Club.

At the regular weekly shoot of the Rochester Rod and Gun Club at the Cobb's Hill ranges and traps, Sim Glover, the club's crack-a-jack, announced his intention of going to New York next week. He will remain in the metropolis and practice for the Grand American Handicap. Glover did some excellent shooting. He made a straight string at the traps, and followed this up with a score of 9 out of a possible 10 targets in the double rises. Worth and Weller shot in their usual good form. The former brought out his new Smith gun, and did great execution with it. It was noticeable that a number of the members have purchased new guns this spring, and several of them had them with them.

One of the events was what is called the "25-bird-miss-and-rest." A man shoots until he misses and then steps back and allows his adversary or adversaries to shoot. When all have missed, the first man again takes his position for the traps. Meyer and Weller were the only contestants. He made his first miss on the 7th target. Weller retired with a miss on his 10th target. Meyer shot and smashed the target, but missed the next target and resigned. Weller got a line on 4 targets, and missed his 2d. Meyer broke the next 19 targets, and won the match. The scores follow:

Events: 1 2 3 4 5 6 7 8
Targets: 10 10 10 10 10 15 10 15
Weller 8 10 7 9 7 13 9 13
Worth 9 7 9 9 7 10 6 8
Borst 6 4 10 7 11
Gibson 5 7 4 7 9 12
McCord 8 8 10 14
Moshier 8 8 10 14
Parsons 7 8 9
Meyer 9 9 15 8 12
Glover 10 10
King 6 6
Rogers 6 7 11 7 10

Doubles, 10 targets:
Meyer 00 11 11 01 11—7
Weller 11 11 10 11—8
Worth 00 11 11 00 10—5
McCord 10 10 11 10 10—6
Worth 10 10 11 10 10—6
Glover 11 11 10 11 11—9
Rogers 10 11 11 10 10—7

Twenty-five birds, miss and rest:
Meyer 11111010111111111111—25
Weller 11111111011110—13

The prize handicap contest, to be shot on the dates of March 29, April 5, 12, 19, 26, May 3, 10, 17, 24 and 31, have for prizes two gold badges, which have been donated, one by Mr. Thos. R. Griffith, of Rochester, and the other by the Dent Dog Medicine Co., of Chicago, together with two extra prizes to be purchased with the entrance money, will be shot for on the above dates.

A single entrance fee of 50 cents will be charged each shooter who wishes to enter the series of shoots, and the money so received will be divided 60 and 40 per cent., respectively, for third and fourth prizes, winner to have selection of prizes purchased. Members may enter the contest on either of the first three dates mentioned and not later. Members missing any single day contest may on the next week, and not later, shoot a score for the one missed. The maximum score to be 25. Members may shoot until their score is satisfactory. At any time after the 10th shot he can re-enter for new score as many times as he desires. Members must notify the scorer before shooting if it shall be his official score or for practice only. Four credits will be given the high guns at each shoot. Members having credits may challenge each other for individual contests by posting such challenge at club house at least one week in advance, with equal notice to challenged party. All challenges must be shot to count. All ties must be shot off. Prizes will be awarded the four shooters having the greatest number of credits at close of shoot, May 31.

The committee reserve the right to change the following handicap at any time: Myers 25, Glover 25, McCord 26, Byer 26, Lane 26, Weller 27, Norton 28, Case 28, Borst 28, Davis 29, Kay 29, Parsons 29, Foley 29, Moshier 29, Tassel 29, Wride 30, Griffith 30, Rickman 30, Galbraith 30, Fulton 31, Kershner 31, McCheyney 32, Wray 32, Summer 32, Lowden 32, Judson 33, Daly 35, Cutting 35, Gibson 33, Hadley 29, Schleyer 31. Members not mentioned in the above list will be handicapped on their first appearance. Committee: W. H. Chase, F. E. McCord, A. A. Moshier and J. L. Weller.

Kingsbridge Gun Club.

NEW YORK, March 22.—We have just organized a new gun club at Kingsbridge, and I herewith send you the list of officers and also of the members up to date. You will from time to time receive scores made by the members of this club. It is our intention to hold a shoot on the second Saturday of each and every month, both for live birds and clay targets.

Officers: President, Mr. Louis Brandt; Secretary, Mr. Cortlandt Godwin; Treasurer, Mr. Oliver Brandt; Captain, Mr. Raynor Godwin; Lieut. Mr. M. R. Weightman; Referee, Mr. B. H. Norton.

Members: C. A. Freese, M. R. Weightman, Raynor Godwin, Cortlandt Godwin, Louis Brandt, Oliver R. Brandt, Carl Moller and Max F. Schmittberger, Kingsbridge, N. Y.; G. W. Silberhorn and Max F. Schmittberger, 218 West 127th street; J. A. 55 West 113th street; J. C. Picken, 61 West 113th street; Gilbert Sutton, 272 West 139th street; B. H. Norton, 46 Cedar street.

B. H. NORTON.

Catchpole Gun Club.

WOLCOTT, N. Y., March 22.—The following scores were made by members of the Catchpole Gun Club to-day. The club will give a programme shoot on March 30, beginning at 1 P. M.

New Utrecht Gun Club.

Woodlawn, L. I., March 18.—The return match between the Crescent Athletic Club and the New Utrecht Gun Club was shot at the grounds of the latter to-day. The race was shot in a pouring rain, which made the contestants uncomfortable and the scores low. The live-bird event, which followed the team race, resulted in a victory for Jere Lott, who was the only Crescent man to kill straight. He was presented with an oak plaque, on which was the emblem of both clubs in silver, and offered by the home club, to be shot for by the guests. Some of the New Utrechts shot along in an optional sweep. Scores:

PUBLISHERS' DEPARTMENT.

An Easter Outing.

SIX-DAY TOUR TO OLD POINT COMFORT, RICHMOND, AND WASHINGTON VIA PENNSYLVANIA RAILROAD.

The fourth of the present series of personally conducted tours to Old Point Comfort, Richmond and Washington via the Pennsylvania Railroad will leave New York and Philadelphia on Saturday, April 1, affording a delightful Easter outing.

Tickets, including transportation, meals en route in both directions, transfers of passengers and baggage, hotel accommodations at Old Point Comfort, Richmond and Washington, and carriage ride about Richmond—in fact, every necessary expense for a period of six days—will be sold at rate of \$34 from New York, Brooklyn and Newark; \$32.50 from Trenton; \$31 from Philadelphia, and proportionate rates from other stations.

OLD POINT COMFORT ONLY.

Tickets to Old Point Comfort only, including luncheon on going trip, one and three-fourths days' board at that place, and good to return direct by regular trains within six days, will be sold in connection with this tour at rate of \$15 from New York; \$13.50 from Trenton; \$12.50 from Philadelphia, and proportionate rates from other points.

For itineraries and full information apply to ticket agents; Tourist Agent, 1196 Broadway, New York; 739 Broad street, Newark, N. J.; or Geo. W. Boyd, Assistant General Passenger Agent, Broad Street Station, Philadelphia.—Adv.

SIX MONTHS, \$2.

NEW YORK, SATURDAY, APRIL 8, 1899.

VOL. III, No. 14.
No. 846 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

NOTICE.

THE New York Clearing House has adopted new regulations governing the collection of checks and drafts on banks outside of the city. This entails a collection expense on those who receive such checks. Our patrons are requested, therefore, in making their remittances to send postal or express money order, postage stamps, or check or draft on a New York city bank, or other New York current funds.

AMERICAN GAME PARKS.

We continue in this issue our fifth annual review of American game preserves. The first report of this series was printed in the number for Feb. 17, 1894. In 1895 articles were printed May 11 and 18; in 1896, July 4, 11 and 18; and in 1897, July 24, 31 and Aug. 7.

In the five years which have passed since the first report was published, the number and scope of American preserves have increased tremendously. Previously to 1894 the preserves had not attracted much attention among sportsmen, nor otherwise. Of the fenced preserves, Mr. Corbin's great Blue Mountain Park had only been stocked with game four years, and Mr. George Gould's Furlough Lodge Preserve, and Mr. Rutherford Stuyvesant's Tranquility Park about the same length of time, while Litchfield Park and Ne-ha-sa-ne Park were only a few months old. The period marked the transition from the shooting club, which exercised an often precarious control over leased lands, to the preserve which acquired ownership and set to work on an entirely new basis, not only to protect the game already existing on the land, but to increase it, often by the importation of animals, birds and fish which were not then to be found in the neighborhood.

This journal has chronicled the changing conditions not only in its park reports, but also in such articles as that published some time since, showing the great extent of preserved holdings within the limits of the Adirondack State Park, and also in the articles on Western preserves. The new order has undoubtedly come to stay, and though at the present time a falling off in the number of new parks is noticeable, the halt is apparently only temporary, and one may confidently count upon a steady increase in the number of new enterprises of this character from year to year.

The conditions which favor preserves are cheap land with attractive natural features and trespass laws which are clearly defined and easily enforced. In this country there are large areas of hunting country, where either State laws, public sentiment or natural conditions effectually operate against preserves, and it is not likely that the system will ever attain the predominance enjoyed in European countries, where the wealthy classes effectually monopolize the shooting.

An interesting feature in connection with these preserves, and one which has attracted little attention, is the business of securing and rearing game animals for stocking them.

Elsewhere will be found a letter from a man who has given his entire time for years to this business. The original animals which formed the nucleus for the preserved elk herds have come chiefly from the country lying in the immediate neighborhood of the Yellowstone National Park, either in Wyoming or Idaho. The buffalo came from Texas, Nebraska, Colorado and Montana. The moose from eastern Canada, and the deer from nearly every State in the Union. The various game animals have certain commercial values, which, however, vary considerably from time to time, according to supply and demand.

Here are a few prices quoted from the letter of a dealer in wild game: Canadian beaver, \$50 per pair, de-

livered; buffalo, \$1,000 per pair, delivered; whitetail deer, \$50 per pair; fallow deer, \$50 per pair; wild turkey, \$15 per pair; moose, offered \$175, asked \$250 apiece.

The writer of the letter says: "Moose bring \$350 each on the steamer dock at any port in England or Germany. I do not know much about Caribou; never had them offered to me lower than \$200 each."

Elk are not quoted in this letter, but are said to be worth about \$75 apiece, delivered.

In certain parts of the country farmers and others have taken to raising game as a business. They have begun with the intention of supplying game parks with acclimated animals for stocking, but it is likely that some at least will look for a market for their surplus animals whenever possible by butchering them and selling the meat. Elk and deer can be raised in captivity with good management almost as readily as the ordinary farm stock. The chief requirements are suitable fences and a liberal amount of shade and water, with plenty of grass. Pound for pound, they are worth several times as much as cattle, and are just as easily cared for.

The possibilities in buffalo raising are much greater. In six years the buffalo in the Corbin herd increased threefold. There is no more valuable stock in existence. When FOREST AND STREAM took its census of the buffalo two years ago it was estimated that there were only about 600 American bison in captivity. The wild bison are certain to be extinct in a very few years, and their number at the present time is so small as not to affect the general result. A certain demand for buffalo can be counted upon from zoological gardens in various parts of the world, and also from owners of preserves.

The greatest need of buffalo breeders at the present time is the infusion of new blood into their herds. As FOREST AND STREAM long ago pointed out, a buffalo stud book is very desirable. It would not be a difficult task to record the pedigree and history of every known animal, and such information would be of incalculable value in governing future breeding. The stock now in existence was secured from both the Northern and Southern herds of wild buffalo, and there is ample opportunity for the intelligent selection of strains.

EARLY SPRING.

THIS is no zephyr that comes tearing up from the south, threshing the naked boughs as if it would destroy the last bud before its chance of bursting, and out-roaring the brooks' boisterous rejoicing over their new freedom, yet there is a sweet promise in its gusty breath—a promise that we cherish and believe in, for it has been often given and always soon or late redeemed.

These are not musical notes that the crows utter as they are tumbled and tossed along before it in disorderly flight, but they are notes of rejoicing, and also a promise of sweeter voices that shall presently be heard.

There is a hopeless look in the fields hemmed with soiled drifts and untidy with the flotsam and jetsam of winter storms. No less so is the forest, its once unsullied floor bestrewn with tatters of bark and last year's leaves, yet we see beyond all dreariness of present desolation what has been again and again revealed to us.

Even now we may see where the raccoon and the woodchuck have writ down their faith in the coming resurrection of life with their tracks on the solid page, and we hear it declared by the trumpets of the geese and the shrill pipes of "small fowl making noise" of rejoicing. In the shallow pools of the meadows the blue of heaven is reflected, the whiteness of its clouds, and at night its stars, where by and by shall be the bloom of violets and daisies and dandelions, and bees shall hum to and fro between them in sweet traffic, and fill the empty mouse-nests with brown comb.

Through the roar of the wind and the dash of branches we catch the jubilant song of bobolink and lark and oriole, the call of the cuckoo, the bells and flutes of the woodland thrushes. Finer than the angry turmoil of the brook's yellow overflowing flood we hear its babble of green fields where happy anglers wade ankle deep in lush grass, and the banished kingfisher has come to his own again.

Through the dun of fields and the gray of woodlands as through thin veils we see green grass springing and the burgeoning of branches; ledges, blushing with the

bloom of honeysuckles; the brown floor of the woods dappled with moose-flower and squirrel-cup. The birds are busy with nest building, from his freshly swept-threshold the woodchuck regards the growing clover, and the chipmunk sits at his door in the sun, clucking his contentment.

So often have we seen this miracle of spring wrought, that with the eye of faith, more than of fancy, we see it repeated, and in spite of all delays and relapses of the fickle weather, we hopefully await its fulfilment.

AN INCIDENT OF THE BAD LANDS.

TO HIS intimates the late Prof. Marsh was known not only as a scientific man of great ability and world-wide reputation, but also as a delightful companion, quick and witty, with a keen appreciation of humor, and a narrator of capital stories. One of these, which he used to tell of himself with great effect, dealt with a small adventure had many years ago in the Rocky Mountains.

The first month or two of the trip had been spent on the plains of Nebraska and Wyoming, at that time the hunting ground of Sioux and Cheyennes, who were bitterly hostile, and signs of whose presence near the command were often seen. The whole party realized that they were in a dangerous country, and all hands were constantly on the watch for enemies and were careful not wander far from the command; or, if two or three fossil gatherers did go off from the main body, they took with them a number of soldiers to stand guard while they worked. After leaving this dangerous region the expedition moved on to the bad lands near Fort Bridger, where there were but few Indians, and those friendly ones, and the work of gathering fossils went on.

One day Prof. Marsh was hard at work on his knees in the bottom of the narrow ravine, digging away the soil from a bone which stuck out of the bank. He was entirely absorbed in his task, and noticed nothing of what was going on about him, until the brilliant sunlight, which poured down on him, was cut off by a dark shadow, and he looked up to see standing above him a great grim Indian warrior, holding his rifle at a ready. The Professor's heart leaped into his throat. He forgot where he was. He strove to utter a propitiatory "How," but his dry lips refused to form the word, and he could only swallow trying to get rid of the lump in his throat. Suddenly the savage bent toward him and spoke: "Have I the honor of addressing Prof. Othneil Charles Marsh, the eminent paleontologist of Yale College?" he inquired. The revulsion of feeling was almost too much for the Professor, who was now even less able to speak than he had been before.

It developed that the Indian, as a small boy, had been sent East, Christianized, educated, taught the elements of theology, and sent back to the West to civilize his tribe; but he had not carried the civilization very far.

That is a curious notion expressed by Mr. Mather, but by no means peculiar to his holding, that when a fisherman catches a fish from public waters he has an absolute "right" to do with it whatever he may elect, the law to the contrary notwithstanding. The well-established principle is, on the contrary, that the taking of fish or game carries with it absolutely no "right" except such as the statute itself confers in express terms, or such as may be inferred from the silence of the statute. Thus, referring to the specific case in point, for perfectly good and sufficient reasons the State of New York has enacted that no one may take trout from public waters for the purpose of stocking private waters. A moment's consideration will show the reasonableness of this. The trout in public waters belong to the people for their fishing for fun and food. To preserve them for this purpose the men who would "skin out" a stream of its trout for their own private waters must be restrained. Experience has proved this. The law provides this restraint by forbidding the taking of fish for that purpose. The fish belong to the State; it is for the State to say whether they may be taken at all; and, if so, in what times, in what ways, for what purpose, and what use may be made of them. All this is so clearly set forth in the famous United States Supreme Court decision in the Geer vs. State of Connecticut case that we advise those who talk of fishing "rights" to study it.

The Sportsman Tourist.

Wreck of the Schooner Lupe.

"MADAM," said Captain Wilson most politely, "madam, I have come dripping wet from the sea to protest the schooner Lupe as she lies on the Matafagatele reef and her tackle and appurtenances. Likewise four Savages which Cap'n Harry Smith said you could depend upon, and which you can't. Likewise and also, I protest Cap'n Harry Smith who said you could depend on them Savages and you can't do it, or else I wouldn't be here protesting them three things, the schooner and the Savages and Cap'n Harry Smith."

Now all this sort of thing was manifestly consular business, and as such belonged to the masculine and official member of the household. It is not for a woman sitting on the verandah of the unofficial side of the consulate at Apia to deal with protests of mariners, even though they do come dripping wet from the sea. All this was explained to Captain Wilson, who was leaving a pool of salt water on the verandah where he stood in a respectful attitude. He was told that he would have to await the return of the proper official, who just then was off in the boat in pursuit of some one of those wild nightmares of war which are the sum and substance of Samoan politics. But none of these considerations had any weight with the drenched mariner, he had come right out of the sea to protest and nothing short of a protest would satisfy him. The only way to content him was to rummage through the rack of official blank forms to find a dusty and mildewed copy of Form No. 58 which is provided for mariners to protest on. Then by laying down a string of mats on the floor from the pool in which he stood on the verandah, a way was made by which he could come inside the office and sign his name, a laborious operation but as satisfactory to himself as though the thing had been done in proper form. One may have cherished ideas of keeping floors neat and tidy, but it is impossible to prepare in advance for official calls of shipwrecked mariners just out of the sea in which they have been shipwrecked. That is one of the unusual states of affairs which would worry almost any housekeeper. Still it was in a sense flattering to see that the shipwrecked mariner was content to have his protest taken down by a woman not authorized to the performance of such duties of the consular service of the United States.

When Captain Wilson had dissolved himself out of the office, and the chain of mats had been thrown out on the grass to dry, he insisted on recounting his tale of marine disaster and the shattering of confidence recklessly placed in Cap'n Harry Smith.

"Yes'm," continued Captain Wilson, "if you'll get your umbrella to keep the sun off and just step down on the beach here you can see the Lupe where she lies and where I protest her and her tackle and her appurtenances. You better fetch along that spyglass that was bought at Strutt's auction for three dollars, there may be three dollars worth of seeing in it."

Sure enough, when one stood just at the very verge of the sands it was possible to see a two-masted schooner high and dry on the reef a mile or so up the coast, and with the spyglass it was possible to make out more details of her shipwrecked condition. The glass was all right if only one had learned the knack of keeping it from coming apart at the joint; so long as the big tube did not drop off from the little tube you could see several dollars worth, even though the captain was doubtful about it. With a comprehensive sweep of his arm in that direction he repeated "There's the schooner Lupe and I protest her and her tackle and her appurtenances." Captain Wilson is not the only one who has found a sort of satisfaction in some complicated official formula.

Then turning to a group of four natives who were sitting wet and impassive on the broken mast of the Trenton at the foot of the flagstaff, he repeated his statement that he protested "them Savages." That was one unfortunate feature of treasuring that broken piece of timber which is all that is left of the flag ship wrecked in the great Apia hurricane. It was very nice to have a memento of the historic event, but the mast was a nuisance in that it provided a perch for all the idle Samoans to come and roost on, and a fair half the time was spent shooting them off. When Captain Wilson had protested Savages it created the impression that some dreadful deed had been done by the islanders. But the four on the mast were unmistakably boys from Niue, or Savage Islanders. In the varied mixture of islanders about Apia it is always possible to identify the Savage Islanders through their fondness for clothes; others may be content with a lavalava, but the Niue boys rig themselves out in shirts and overalls with the very first wages they earn. Therefore, when the shipwrecked mariner protested four Savages he meant only his crew of Savage Islanders, whom he had set down there on the mast

where he could keep them under his eye until he finished his business.

Captain Wilson, who had just been wrecked, was some sort of a Finn, but at some time he had been naturalized in some American port and on that score felt himself authorized to do all his nautical business with the American consulate. It turned out on further investigation that this assumption was inaccurate, for his wrecked schooner was not entitled to sail under the American flag. But the mysteries of the navigation laws of the United States are not included in any curriculum of feminine education and mistakes are therefore pardonable. When Captain Wilson was not sailing he was the general mender of clocks for all Apia, a community habitually careless of time and inclined to be content if they find their clocks are keeping the same day when Captain O'Ryan fires a cannon at the pilot station at noon on Saturday so that the beach may know once a week what time it is.

Despite the filling out of Form No. 58 there was nothing to show how the schooner was wrecked and where the responsibility of Cap'n Harry Smith entered into the disaster. That was a part of the narrative which the shipwrecked captain was only too anxious to disclose, for by it he expected to show that the responsibility for the loss did not lie on his shoulders.

He began by telling how he had been chartered by the German firm to go to windward for a cargo of copra which was ready to bring down to Apia. If any keen intelligence discerns any slip in the nautical terms the blame is not to be laid on Captain Wilson who was probably as accurate in the use of his marine dialect as

looking for the land breeze, and Cap'n Harry Smith he sat back in his chair and told me it was a waste of time looking for it to set in until midnight. But I felt it a little fresh, not exactly a breeze, but a good sign it was going to come. So I told him to wet his finger and hold it up and then he'd see whether the land breeze always waited till midnight. That fixed him and he said that maybe it was a little bit earlier for just that once, and that any way a cool feeling on a finger wasn't enough to sail out of harbor on. So I sat down with him just to finish it up, for I was for going off to the schooner and beginning to get the anchor up.

"Yes'm. Where was me and Cap'n Harry Smith all this time? Oh, part of the time at one place and part of the time at another along the beach. But when it came eleven o'clock they shut up for the night and so we finished off at my house where I had to go for some of my things. As I was saying, for when there's been a wreck you've got to tell everything just as it was, I was for going off to the schooner. But Cap'n Harry kept on saying the wind was too light yet, and really it didn't amount to much, only to prove that land breezes do come before midnight. So we sat down with what I happened to have in the house and Cap'n Harry he told me some more about the harbors to windward. By and by I was getting a little bit uneasy about getting off at all, for there was precious little wind, but Cap'n Harry he said that it was all right to leave it all to the Savages, they'd know best of all and they knew where to find me when it was time to go. He said Savages was the sort you could depend on, for they make the best sailors

of all these natives. Samoans are no good at all, they're too lazy, and they go to sleep on watch and you can't get them to do more than just so much. But he said he always took Savages for his crew and glad to get them, because you could depend on them always.

"But how did the Lupe come to be wrecked on the Matafagatele reef? Why, that's what I'm telling you, ma'am. I've got to explain why I protest Cap'n Harry Smith and them Savages, for he said you could depend on them and I've proved that you can't. So when he was telling me how the Savages was the most reliable natives and you could always depend on them—which you can't—the head one of them came along to the house. That's him, the biggest of the lot, him that's leaning up against the flagpole fast asleep. He said that the wind would come pretty soon and he had come for me.

"Then Cap'n Harry Smith, what does he say? He says 'them Savages is the best natives in the South Sea, you can always depend on them.'

Well, it did look that way. So I owned up like a man, for I don't mind saying so when another man happens to know more than me, though as a general thing I know as much about these islands as Cap'n Harry Smith, for all he's been here so long. So we had another just to say good-bye on, and I got into the boat and the Savage rowed me out to the schooner.

"That land breeze was light, just enough to get the schooner out of the passage and out far enough away from the reef so's she would be safe. I was going to make an all-night job of it, and keep the helm while it was dark, but the breeze was so very light and I was sleepy. Then I thought of what Cap'n Harry Smith was saying about them Savages that you could always depend on them. And I began to think that perhaps he was right for he had been cruising about the islands so much longer than I had that perhaps he knew best, for I'm not one of those men who stick to their own opinion just because it's theirs; no, ma'am, I stick to my own way of thinking because I know I'm right. Anyway, I had been hard at work all day and that made me sleepy, and then I got some more sleepy discussing them points of sailing with Cap'n Harry Smith, so I made up my mind I'd depend on them four Savages for just the one night so as to try them. So I called the head man of the Savages and I told him we was bound to windward and I was going to turn in and I depended on him to see that the schooner went to windward all night long. I did not say a word to him about Cap'n Harry Smith's saying that they could be depended on, for it might have made them too set up to do any work if they knew that Cap'n Harry gave them the best name in the South Seas after he'd been cruising about the islands so many years. But I just told him I depended on all four of them and then I went to sleep.

"The next thing I knew was this morning when a raft of Samoans came piling down the companion and into the cabin. I was some surprised, for I thought they was Savages when I shipped them, but I see I must have been mistaken along of all the other things I had to do so that I could get off as soon as the firm wanted me to go. While I was puzzling out how I could come to make a mistake like that, signing Samoans on articles for Savages, then it came over me that Cap'n Harry Smith thought they was Savages too, and I knew I had a good joke on him and his telling me that Savages was the only natives you can depend upon. Pretty soon I noticed that the schooner was lying pretty still. Then I

SIGNS OF SPRING.

From a painting by Claude Raguet Hirst. Copyright, 1894, by Claude Raguet Hirst.

a sailor is expected to be, it is rather due to the navigator's inability to keep a clear idea of directions at sea which chase around after the wind. In this case the impression was clear that the schooner was to go to the eastward islands of the archipelago, to Tutuila or to Manu'a, for in Samoa windward always has that meaning. He went on to explain that because the wind blew against the course all day long it was necessary to make a start at night when sometimes there was a wind outside that would help him along several miles to the east before the tradewind began in the morning. There were other details about the need of making a quick trip of it and the bother he had in getting the Savages to sail the schooner for him.

After all these details had been set out in full, for wet as he was, he would not omit a single item which had even the most remote bearing on his cruise which came so promptly to disaster, he then got to the point which introduced Cap'n Harry Smith and the cause of his difficulty hand in hand.

"Along in the early part of the evening, madam," he continued the narrative of wreck, "me and Cap'n Harry Smith was discussing some points of sailing in these here waters and he was telling me about some of them harbors up to windward. Now I know a great deal more about them harbors than Cap'n Harry Smith does, but I didn't tell him so, wanting to be sociable, and it being my last night ashore with him. From time to time he would get up and have a look at the harbor and come back and say it was dead calm. Then that being so, him and me would have another one, and go on talking about points of sailing, for you've got to be mighty knowing when you're sailing up to windward in these islands. Along after ten o'clock I began to look for the wind to get out of the harbor on, but there wasn't any wind and Cap'n Harry he says there never is any wind before midnight, but I know better than that, and I know that ten o'clock is the time to begin looking for the land breeze. Well the land breeze hadn't begun to blow just then, so me and Cap'n Harry took some more just to keep from dry waiting and then we began to argue about it, me knowing all the time that he was wrong and him trying to make out that I never sailed about these islands as long as he had, and on that account wasn't entitled to know anything about the land breeze at night. We was perfectly sociable in our talk, for Cap'n Harry is a good fellow for all that there's lots of things he don't know about sailing. When it got to be eleven o'clock, or maybe the least bit short of it, I went out

went on deck mighty quick, and I see we had gone clean right atop of the reef and the tide going out we was high and dry on the coral. Of course, being so tired I couldn't be expected to wake up when we struck; you see I was depending on them Savages the way Cap'n Harry Smith said you could. But come to look for them they was all fast asleep on deck, and they didn't know we was wrecked until I went around and kicked each one in turn. You see they got hold of some gin I had aboard in case of cramps or any kind of sickness you're likely to get when you're out at sea. They got hold of it and then they got drunk and let the schooner jump the reef and they didn't even call me, but just slept through it all like logs. And before the Samoans thought to wake us up and let us know we were wrecked somebody stole all the sails and rigging and everything else, and then they left us to wade ashore. But I don't mind that so much as I do them Savages, Cap'n Harry Smith was so sure you could depend on them. Because you can't depend on them and I've proved it; that's why I want to protest them Savages; likewise and also, Cap'n Harry Smith which said so."

Now there is all the narrative there ever was in connection with the wreck of the schooner Lupe, which climbed over a Samoan reef and stuck there until successive gales tore her timbers apart. For a shipwreck it may, perhaps, lack the thrill of dashing waves and drowning mariners and things going by the board, if that be the correct way of putting it. There are a plenty of other shipwrecks which have all that sort of thing, this is only a nice cosy little shipwreck designed to illustrate the great truth that Savages can't be depended on, even if Cap'n Harry Smith does say so.

LLEWELLA PIERCE CHURCHILL.

A Bee Hunting Story.

THE story I am about to relate—hoping that it may find a place in the columns of good old FOREST AND STREAM—has the merit of being a true tale both as to the names of persons given and the names of the places at which the incidents occurred. Many years ago, or to be more explicit, in the summer of 1850, the writer was employed in the town of South Deerfield, Mass., by a mill man and farmer, whose mill was situated on a stream known in those days as Bloody Brook—so called from the fact that the Indians a good many years previous to the time of which I write, had swooped down upon the luckless white settlers who then lived in this vicinity, and had ruthlessly murdered many men, women and children; the stream being dyed with the blood of the inoffensive white settlers who were massacred at and near this point, hence the name of Bloody Brook. One bright September morning Mr. Adams, for whom I was at work, informed me that he was about to take a holiday and devote it to a test of skill with the speckled trout with which some of the nearby streams were well stocked in those days. He also informed me that I could accompany him on his fishing trip if I so desired. Of course I gladly accepted the invitation, and bright and early on the Saturday morning we started, taking for transportation purposes Mr. Adams' bay mare. Five o'clock saw us on our journey, and by nine o'clock we were near its end, the fresh bracing air of the beautiful September morning seeming to put new life into our blood as well as into the pony that hustled us along. Shortly after nine o'clock we arrived at the stream and stabled our pony in an old looking log stable that had been erected adjacent to a log shack erected by my companion and a party of city sportsmen from Boston a year or two previous. We proceeded to our pleasant task without loss of time, and in a few hours had as many fine trout as we cared to take home with us—or rather should I say, as we cared to spend the time to catch, as I had persuaded Mr. Adams to devote a part of our day to hunting bees, we having seen many of the busy honey gatherers plying their trade on the flowers in the clearings that were adjacent to the stream upon which we had been at work.

After securing several bees for lining purposes we liberated them one at a time, following their movements with our eyes across the fields and into the woods. Then we would make a "bee line" in the direction taken by the first one liberated till we feared we might miss our line, when we would liberate another and follow in the same fashion as before. We kept this up for some time till we began to think we would soon be obliged to procure more "liners," as we called our captured bees. But success at last crowned our efforts, and we came to a large birch tree that we felt sure must be the home of the colony we had been lining and such it proved to be; but, alas, upon its smooth bark we found the newly cut initials of a man who had located this same colony a day or two before, and to whom by all the rules of the pioneers of the woods the tree before us now belonged, although he had deferred for a time the collecting of his store of honey. Being young and not over scrupulous about what I would now look upon as genuine robbery, I tried to persuade Mr. Adams that we cut down the tree and carry the honey home, but with all of my pleading he was firm in his refusal to meddle with another person's property.

In due course of time we returned home with our fish, but the "bee tree" still haunted my waking hours, and I decided rightly or wrongly to have a share in that honey. I had little difficulty in persuading Nathan Himes, who was also employed by Mr. Adams, to agree to accompany me on a second trip to secure the bees' store; and we decided to go that same night in order to make sure of the prize and to be more secure from detection while procuring the honey. Shortly after supper Himes and I took one of our overseer's horses and with a wagon in which we had placed a large tub and several smaller pails for receiving the honey, started on our expedition. When we arrived at the clearing, which was some half-mile from the bee tree, it was dark. We drove the horse and rig in the direction of the tree by way of a zigzagging wood road till we were forced to stop by the small trees that impeded further progress. We left the horse, and with cross-cut saw and tubs we made our way slowly through the woods till we at last found our tree again. We proceeded at once to our task of felling the tree with the saw. When our task was about half completed we

were nearly scared out of our wits by a party of men with dogs that chanced to pass quite close to us while on a coon-hunting expedition. We feared that it was the owner of the tree and a party of friends that had got wind of our doings and had come to take forcible possession of the tree. Luckily for us it was not so. After this party had got out of sound of us we finished cutting down tree, which by good luck broke in two just at the point where the honey was stored. The night was rather hazy, and we were obliged to work by the aid of a lantern that contained only a tallow dip. Perhaps it was as well that our light was not more brilliant, for as it was Himes was badly stung by the bees, and several times was obliged to run off howling into the woods to free himself from the fierce little tormentors. I might as well say that though I was better protected than my mate, in the excitement of procuring the honey I lost part of my mask and several times I was obliged to follow the same tactics as the luckless Himes. But we persevered, and along in the small hours of the morning had finished despoiling the bees' store and had all of our pails and the big tub filled with honey, and were ready to start for home. By this time Himes and myself were hardly able to see, caused by the many stings we had received in our faces, and with our dim lantern we went groping through the woods looking for our horse. To make matters worse, what little light we had received from the moon had disappeared, as the moon had gone down, and not knowing the woods very well we got turned around, and it was more than an hour before we could locate the spot where we had left the animal. We finally succeeded in finding our horse and then we lugged our honey to the rig and struck out for home, arriving there just as the first red streaks of dawn began to show in the East that the sun would later on show itself again. We were tired as well as chilled through with the cold night air on our drive home, while as to personal appearances we were frights. We had just 87 pounds of honey—very fine and nice—but we were sure we must have had a ton's weight of experience.

It was a good thing for us that it was now the Sabbath day, so we could hide away with our swollen and half-blind eyes, which we were obliged to do all that day; and, to make matters worse, the owner of the tree went on the same Sunday morning to secure his anticipated prize, and when he found it had been taken he was in a terrible state of mind and declared he would take summary vengeance on whoever had taken the honey—provided he could find out the guilty parties. Mr. Adams fearing for our safety as well as for his team had cleaned all traces of the honey and dead bees from the wagon and refused to believe (?) when called upon by the owner of the tree, that his men had taken part in the robbery. Things looked so bad though that Himes and myself were obliged to leave the place until our faces had again resumed their normal condition. Luckily, Himes had a sister living at Northampton, Mass., several miles distant, whither we went on Sunday night and visited till our faces healed and we felt safe to return to our work. This was my first and last attempt to steal another's bee tree, and though helping to gather in many a store of wild bee's honey since that day, I have always looked back upon that boyish escapade with regret, and to this day consider that we paid dear for our whistle.

WM. BROWN.

PROVINCE OF QUEBEC.

The Story of "Dixie."

It has frequently been the subject of discussion regarding the origin of negro minstrelsy which has brought fame and fortune to song writers, musical composers and minstrel performers.

Negro minstrelsy in reality had its origin with the plantation slaves of the South, but their performances, while amusing, were crude, fragmentary and perpetuated only by tradition.

The period when the white race first entered the field of plantation melodies and songs is within the memory of men still living, your correspondent included.

The first known public performance of that character was "Coal Black Rose," sang with self accompaniment on the piano by a blind vocalist, whose name I do not remember.

The next to obtain notoriety was "Old Zip Coon," which the writer, when a small boy, heard under the tent of a show consisting chiefly of two fiddlers, an elephant, and Shetland ponies, ridden circus style, by equestrian monkeys. This was over sixty-five years ago. The song was sung and performed with dance by three burnt-cork minstrels, and its novelty to both old and young afforded great amusement for the audience.

It is questionable whether later songs have excelled it; and few performers on the stage at the present time, when they dance to the tune of "Turkey in the Straw," know that it is the air of "Old Zip Coon" recently revived.

Almost contemporaneously burst into popularity Rice's great hit in "Jim Crow," performed for the first time by him as an interlude in a theater in Pittsburg.

The next in that line who gained notoriety appeared Christy's Minstrels, and Dan Emmett, both being pioneers in professional minstrelsy, and it is difficult to say which, if either, had priority.

The principal object of this article is to contribute in a small way to perpetuate the memory of the author and composer of the world-wide song and air of "Dixie." Daniel D. Emmett is now living in retirement on a farm near Gambier, the seat of Kenyon College, in Ohio. He is a hale old man of eighty-four, and in full possession of his mental faculties. The writer remembers him as a pleasant, blue-eyed young man half a century ago, when his family resided in Mount Vernon, Ohio. His sister was a fine performer on the piano, and the two would often entertain their visitors with choice music, both vocal and instrumental.

Interest in this venerable minstrel has been recently awakened by an ovation tendered to him on the 1st day of the present month, March, 1899, by the cadets of the Military Department of Kenyon College, to whom he feelingly told the story of his life, and detailed all the circumstances under which he wrote his famous song. A report in the morning papers give the interesting details.

The young ladies of Harcourt Place Seminary were present, and the large assemblage filled Delano Hall to overflowing. The enthusiastic welcome of the young people and the kind manner in which he was introduced by N. H. Hills, senior regent of the academy, so touched Mr. Emmett that he could not at once proceed with his address, which he said was the first oration he ever made. Of Southern parentage, he was born in Mt. Vernon Oct. 29, 1815, and was the first white boy born there. His education was such as he gained in the log schoolhouses of the country in those early days. His father was a skillful and prosperous blacksmith, but the son at the age of eighteen, being a promising amateur, became a musician with traveling shows until he was twenty-two years old. In 1843, in connection with three others of similar tastes, he organized the "Virginia Minstrels," which was immediately successful in New York and other Eastern cities of the United States, as well as in Great Britain.

In 1859 he was engaged by Bryant's Minstrels, 472 Broadway, New York, to write comic songs, negro songs and walk-arounds, and to act as musician when required.

"Dixie," with the music, was composed by him early in the spring of 1859, and sung from that time to July 4, 1865, by Mr. Emmett at every performance given at Bryant's.

His recent address at Gambier was received with great applause, and at the close he sang "Dixie" with a chorus improvised from the school during the day. He was heartily encored, and after the performance, the cadets were all presented to him. He is white-haired, robust and physically shows but little indications of his advanced years. It was an enjoyable night for the venerable minstrel.

S. R. HARRIS.

Editor Forest and Stream:

Having seen Mr. Harris' notes on Dan Emmett, I will say: He composed "Dixie" as a "walk-around" in November, 1859. The date is fixed because I came from the West in that month and dropped in to see Emmett, whom I had known, and he was to produce "Dixie" that night, and I heard it. The dancing part is left off now, it is in different tune. The name did not refer to Mason and Dixon's line, but to an old New York City slave holder named Dixie, who was famous for some reason, and as early as 1840 we boys had a game called "Dixie's land." A ring was marked out and one boy was "it." The others would trespass, calling out: "I'm on Dixie's land, Dixie ain't at home." Then, if the first one could catch an intruder, he was "it." Dixie was crowded by the anti-slavery movement and took his slaves south.

FRED MATHER

Natural History.

Handling and Breeding Rocky Mountain Game Animals.

In compliance with your request I take pleasure in giving you such facts as I have gained in ten years handling and breeding game of this locality. The species with which I have had experience are antelope, black-tail deer, mountain sheep, moose, elk and bison. Of the elk I can say the most, having handled something over 300 head that have since been distributed in different parks in the East. A great many of them I caught wild when full grown. The balance were bred in captivity. I find them to be a very hardy animal and one that will thrive under the most unfavorable conditions. They are easily domesticated and become very docile and nice pets. The males at one year old grow a spike horn, and at two years the prongs will vary from three to six on each horn, so the old adage of a prong for each year as the age of a bull elk is exploded.

I had one female elk which grew a horn. She had but one, which came out the summer she was three years old. It grew to be 18 in. in length. It curved down over her face and hung below her nose, and remained that way while I kept her, four years, without shedding the velvet.

After shedding the velvet the males are inclined to be vicious. The old ones will horn the young males, and often kill them, if confined in a small enclosure. I have had several killed that way. To avoid accidents I would dehorn all males more than two years old. As soon as they rub the velvet from the horns they shed the crowns that are left on the head. The next spring the horns grow as usual.

Elk are prolific breeders and drop their first young at three years of age.

Moose, although hardy, tough fellows in their native swamps and hills, in captivity are very tender and soon die, seemingly without any provocation. I have captured several head, all old animals, and only succeeded in keeping one alive. This was a female. She was easily broken to harness, and would come to the call of her name for any distance within hearing. She would eat anything in the line of grain, vegetables, fruit and bread.

After keeping her seven years I sold her to a showman, and she died nine months later in Detroit, Mich.

Black-tail deer do well in a large pasture. They should be captured when fawns, as they are of a very restless disposition and will not do well if caught when grown. They drop their young when two years old, and usually have two each year. Mountain sheep are fast disappearing before the inroads of civilization. They take kindly to domestication, and will breed in a very small place altogether unlike the mountainous range to which they were accustomed. They are most difficult creatures to take alive as the ranges they inhabit are almost inaccessible to man. When a rope is dropped on them they will jump from any height at the risk of injury or death. But if they can be caught and brought down to level ground without being injured in the process the chances are ninety-nine out of a hundred they will live in this altitude. Their food in captivity consists of wild hay, vegetables and, above all, oats. Like the deer, they drop two young and breed at an early age.

The antelope, while not a great success, can be bred with great care and time and a large pasture. I have

been breeding bison four years next May. Last spring I caught two calves, male and female. The cow dropped a fine heifer calf. Last summer I bred twelve Galaway cows to the bison bull. Now I am waiting with curiosity to see what the offspring will be like, as the crossing is an experiment with me and predictions are many and various as to the outcome. DICK ROCK.

LAKE, Idaho.

Weights of Foxes.

Editor Forest and Stream:

The enclosed clipping is taken from the Winchester, Mass., Star:

"Many frequenters of the Middlesex Fells have seen at different times a large black fox—an exceeding rarity. Word has been received from Mr. Gerry, of Stoneham, that this fox was shot last week in Burlington. He weighed 27lbs."

As the item states, a black fox in New England is "an exceeding rarity," but a fox of any color actually weighing 27lbs. is something I never heard of before. I have shot something over 200 New Hampshire foxes and have carefully weighed a good many immediately after they were killed. Our ordinary red fox weighs from 8½ to 9lbs. We consider 10lbs. large, and 12lbs. an unusually large one. The largest I ever killed weighed 13lbs. I usually kill every winter several weighing from 10 to 12lbs., and they are always old doe foxes in fine condition. A fox is very deceptive in appearance, as to his weight. His winter coat is long and the hair stands out straight. Strip off his pelt, and what is left is comparatively very small.

Estimated weight of wild animals, as I have found, invariably exceeds the actual. A black bear was killed late one fall while swimming across Parmachenee Lake, in Maine. This bear was towed to the wharf at Danforth's Camp. There were several sportsmen and guides there at the time, and they all estimated the weight. The bear's fur was full of water, which would greatly add to his weight. The general estimate was 400lbs. As there was a set of Fairbanks scales at the camp, the bear was weighed, and the actual weight was 250lbs. In several instances I have known of the estimated and actual weight of different animals to vary fully as much. If any of the readers of FOREST AND STREAM know anything about this 27lb. fox, the FOREST AND STREAM would be glad to hear of it. C. M. STARK.

DUNBARTON, N. H.

Alaska as a Game Country.

JUNEAU, Alaska.—Editor Forest and Stream: We expect a great many visitors to Alaska next summer. Many of them attracted by the remarkable gold discoveries, the richest of which are so near to Juneau that they can be visited in two days. In addition to this, there will be tourists and others in search of big game shooting.

Upon Admiralty Island, 100 miles from Juneau, reached easily in a day by local steamer, black bear can be found in abundance. The Indians inform me that from a point on the beach where the boat lands to a point up a gentle rise two miles away, they don't care to travel at night, as the bears are very large and ferocious. Some of the finest skins ever brought to Juneau came from that vicinity.

Deer are in abundance. Fishing and duck hunting almost cease to be sport.

On Shelter Island, upon Lynn Canal, ten miles from Juneau, a sportsman can find all the wolves he wants. When the steamer Detroit was wrecked there a few months ago, the passengers and crew had occasion to camp out for two nights, and so numerous were the wolves, big gray fellows, that it became necessary to place a guard at the door of the tent to protect the men and their passengers. W. A. BEDDOE.

Hawk and Grouse.

BERKELEY, IOWA.—Editor Forest and Stream: While strolling through the fields one day in February I was an interested spectator in witnessing the capture of a pinated grouse by a red-tailed hawk. The hawk was observed soaring slowly about over an oat stubble, when he suddenly darted to the ground, and arose with the bird in his talons. As there seemed to be no struggle in the air it must have been killed almost instantly when struck by the hawk. The whole affair took place so quickly and unexpectedly that I could hardly believe my vision. Thinking the bird could not possibly sustain the load for any distance, I followed its flight, but after flying some distance they were obscured by the intervening woods. This is the first incident I have ever noticed where the red-tailed hawk has attempted to carry off anything as large as the prairie chicken, and it was doubtless driven to it through necessity.

The heavy snows and extremely cold weather of the previous three weeks having cut off his food supply, and with starvation staring him in the face it was his only alternative. E. D. CARTER.

The Linnaean Society of New York.

REGULAR meetings of the society will be held in the American Museum of Natural History, on Tuesday evenings, April 11 and 25th, at 8 o'clock.

April 11.—By members. "The Warblers of North America." Exhibition of specimens, with discussion of distribution, habits, etc., of Magnolia, cerulean, chestnut-sided, bay-breasted, black poll and blackburnian warblers.

April 25.—By members. "The Warblers of North America." Exhibition of specimens, with discussion of distribution, habits, etc., of yellow-throated, sycamore, Grace's black-throated gray, golden-cheeked, black-throated green, Townsend's and hermit warblers.

WALTER W. GRANGER, Sec'y.

AMERICAN MUSEUM OF NATURAL HISTORY.

A Penobscot Buck.

THE illustration is of a beautifully marked buck, killed by Mr. Fred Hubbard, of East Berlin, Conn., in the East Branch Penobscot Valley of Maine. The party consisted of Messrs. Hubbard, J. N. Akarman, of Worcester, Mass., and Jno. Towne, of Amherst, Mass. This buck was of very large size, and the unusual marking is a white with dun mottling. The mounted effigy now adorns the rooms of the new athletic building in East Berlin.

Crow and Engine.

UTICA, March 31.—Lieut.-Gov. Woodruff and a party of friends came up the Central to-day on an observation engine bound for Fulton Chain, where they are to spend Sunday. Between Frankfort and this city a crow struck the window of the engine and shattered it. Some pieces of glass struck the Lieutenant-Governor in the face and the dead body of the bird hit him on the forehead. Upon reaching this city the Lieutenant-Governor visited a drug store, where a liberal application of court plaster was made.—New York Herald.

Game Bag and Gun.

New Hampshire Fox Hunting.

IN FOREST AND STREAM of Jan. 7, a correspondent writes: "In the South they hunt foxes with foxhounds, and join the folk of the old world in calling it treason to kill a fox in any other way. In New England they go not fox-hunting, but fox-shooting, and consider it sweet and decent to shoot a driven fox with any sort of gun. Out in North Dakota they hunt the fox with greyhounds."

To follow a pack of hounds, as is the custom in the South or in the old world, over such rough country as we have, would be impracticable. To use greyhounds or any fast dogs which follow by sight only, would be equally so. Such dogs might succeed where our foxes fools enough to keep on open ground. Our New England method is almost as old as our granite hills. We who follow it are satisfied to call it fox-hunting. Others may call it what they will.

have been asked recently by some of FOREST AND STREAM's readers to give my experience as connected

A PENOBSCOT BUCK.
White, with Dun Mottling.

with our foxes when hunting them in our New England manner. During the past twenty-five years I have hunted them more or less each winter. I seldom begin until snow falls. When I go out it is with the intention of shooting every fox I can, and I do not hesitate to use any means of outwitting them.

A good dog is necessary, and what I consider a really good fox dog is not always easy to find. I do not like a very fast dog, neither must he be too slow. The first drives too many foxes out of hearing, while the latter gives them too much time to play their well-known tricks. I want a dog to have a clear voice and to give tongue fast and regularly after the fox is started. I have found that foxes are often afraid of a coarse heavy-voiced dog, and also of one which only barks now and then. One of the latter sort I have found to be the poorest kind of foxhound, no matter what other good qualities he might possess. A fox wants to know just about where the dog is and will keep much nearer to one which barks steadily. The dog must be a good ranger, hunting the ground well, and should come in at least every half-hour, should he fail to find a track. He must know enough to come home after a run and not stop at the nearest house, no matter how tired he may be. One other point I am particular about is, that he must do his work himself and not go to join any other hounds he may hear. It is comparatively easy to get a hound having some of the above requirements, but one which combines them all is not found so easily.

As for breeding. In this section we do not count on long or high pedigrees. Some of the most worthless foxhounds I have ever seen for practical work were blue-blooded. They might take prizes on the bench but they could not follow a fox. Puppies from a bitch known to be a good fox dog and from a similar dog, almost invariably learn quickly. The dog I now have I consider one of the best I have owned. He is of medium size, standing nineteen inches at the shoulders, black, white and tan and mottled. He is not a fast runner, but still he holes more foxes than any dog I have had. This is the third winter I have owned him, and he has driven in thirty-three. As I seldom try to get a fox after he holes, I do not like this, but know of no way to help it.

For a good foxhound, from two to four years' old, twenty-five dollars is considered here a fair price. Sometimes a good one can be bought for half that amount.

Again there are some for which a much higher price would be asked. Such cases, however, are where the owner of a hound does not wish to part with the dog and would only be tempted by the amount offered.

Speaking of very fast running hounds. Some years since there was such a dog owned a few miles from here. I am very sure that without exception there never has been such a dog in this part of New Hampshire. He was a cross between a foxhound and a bull dog, and looked like a hound, but with shorter ears than our natives. He was not a large dog, but stood up pretty well. Were this dog alive to-day and in his prime, I would like to see him compete in some of the trials where speed and accuracy were the point. He was the only dog I have known which could and did catch our red foxes. He caught and killed fifteen foxes one winter, and not one of them had been previously shot at or injured in any manner. When he got after a fox the latter did not have any time to fool around and when he once got hold of one his bull-dog nature was in evidence, and he never broke his hold as long as the fox had any life in him. He was wonderfully true on a track when a fox ran the roads, on ice or such places. One day when there was a few inches of snow he drove a fox through a field in front of the house, saw the fox when he came into the field and saw him follow around after the sheep which raced off when they saw him. The dog was not far behind and one of the men who knew the dog by his voice said "George's dog will get bothered among all those sheep tracks." The dog, however, never made a skip or a break and was on after the fox and out of hearing in a few minutes. Another time he drove a fox through a small village near here. It is about half a mile in length, and the fox kept in the road with the dog about three rods behind. Neither seemed to gain, and at a turn in the road the fox left and went into a rocky pasture where the dog caught and killed him. A fox was started by this dog near where he was owned. There was some crust on the snow which favored the fox. The dog drove him about ten miles, nearly straight away. During the run the fox passed near where lived an old fox-hunter, who saw him cross a pasture quite a distance ahead of the dog. The old man said to some men who were with him, "He has got after a fox this time that he will never catch, no dog could on such running." But the dog did catch and kill the fox, and his owner followed up the trail and found the fox the next day. This dog did not hole so many foxes as any one would suppose. Perhaps he pushed them so fast that they did not have time to go to holes they knew of. Now I would not care to own such a dog. About the only chance to shoot a fox ahead of him was to get on some runaway before the fox was started; and nearly always to find a fox which he had caught and killed entailed a very long tramp.

Occasionally a rather slow dog will catch a fox. I never knew of but one instance of any of my dogs doing so. On that day there were several inches of very light snow and it was easy running. The dog caught this fox in about fifteen minutes after starting him. I saw the fox cross a meadow some five minutes before he was caught and he was running easily and about one hundred yards ahead of the dog. They both went into a thick piece of bushes and sproutland, and the dog stopped barking. Thinking he had holed him I followed on and found the dog lying on the fox which he had killed. I could not see any signs of the fox having been hurt in any way before the dog caught him, and it has always been a mystery how the dog got near enough to get hold of him.

I usually go alone when after foxes, and I decidedly prefer to use but one dog. There may be (while it can be heard) more music hearing a number of dogs driving a fox, but our foxes when so hunted nearly always run straight out of hearing and often do not come back during the day. Of course, foxes will sometimes run straight away for a good many miles when followed by a single dog and a slow one at that, but I find it is only occasionally, while with a number of dogs they nearly always do so. I have shot a good many foxes during the time I have been after them, and am now pretty well in the third hundred of what I have killed. With one exception they were all killed in this section. I have noticed that our foxes change their routes some years. One winter nearly every fox when followed by a dog will take to high ground, running over ledges and the tops of ridges, while, perhaps, the following winter in the same locality hardly a fox will run in such places, they keep on low ground and in sproutland or thick small growth of pine or hemlock. They have done so almost entirely during the past winter and would seldom go over a hill, keeping well down and going around.

Another change in this vicinity is in the color. We seldom now get a fox of as dark red color as in years past. They incline towards a light grayish color on flanks and back. During the past six months I have seen but one of as deep a red as we used to kill. Foxes, like almost everything which runs or flies, are hunted a great deal more than in years, long past. To-day they are wilder, and run over more ground than formerly. The past winter has been unusually unfavorable for our style of hunting them. Days when it was even fair running, have been few and far between. Yet I know of sixty-one being killed within a radius of seven or eight miles of here. Of this number I shot ten. C. M. STARK.

DUNBARTON, N. H.

There is such a thing as knowing your business too well. Mr. Boodle and Mr. Griffin, of Hampton county, were out hunting wild turkeys in Coosawatchie swamp. Each was "yelping," and their imitations of the movements and calls of the turkey were so realistic that they deceived each other. The result was that after dodging and yelping around in the underbrush an hour or so Mr. Griffin caught sight of something moving and fired promptly, putting four buckshot into the temple of Mr. Boodle, which was the end of poor Boodle. When Mr. Griffin went for his turkey he found a dead man whom he had never seen before. No doubt it was a question of which got the first sight of the other. Each thought he was calling a wild turkey.—Greenville (S. C.) News.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

American Game Parks.

The "Forest and Stream's" Fifth Annual Report on Game in Preserves.

(Continued from page 248.)

Blue Mountain Forest Park.

CHIEF among the fenced preserves, by reason of its size and importance, is the Corbin Blue Mountain Forest Park, near Newport, N. H., south of the White Mountains. The tract includes more than forty square miles, surrounded by a fence, and there are at the present time more than 300 large game animals included in its limits. The park has always been intended for a hunting preserve, and more or less game has been killed in it of recent years, but the hunting idea is developing, and the club feature promises to be more prominent in future. The park enjoys special laws relative to its game. Exotic game can be killed or shipped at any time, and an extended season is provided for hunting deer and moose. The game is especially protected against poachers. Some four years ago the State of New Hampshire passed a law making it a misdemeanor to kill deer in the park. Mr. Corbin at the same time stipulating that the area of the park should never be increased in size more than 1,000 acres additional.

A year ago the State passed a law making a five year's close season on deer. Two counties were excepted, and also by special amendment, Blue Mountain Forest Park. The big game open season in New Hampshire, where hunting is permitted, extends from Sept. 15 to Nov. 30. The laws of 1899, passed two weeks ago, contain an amendment in favor of the park as follows:

"Except that the Blue Mountain Forest Association may kill deer and moose within the confines of its game preserve, as established by Chapter 258 of the Laws of 1895, until Jan. 15 of each year, and may ship them to points without the State at any time when accompanied by a certificate of the Fish and Game Commission that they were legally killed, and the Fish and Game Commission shall provide such rules and regulations as are necessary for the carrying out of the provisions of this paragraph without any expense to the State of New Hampshire."

In 1898 twenty-five deer and six elk were killed in the preserve. We are indebted to Mr. Austin Corbin for the following additional particulars:

"The stockholders of the Association have done little during the past year except keep the property, including roads and fences, in general repair. All classes of game are thriving as well as could possibly be desired. No dead animals are found except such as apparently die from old age; and a few wapiti that have been killed by lice or ticks. The wapiti, and indeed all the game, are getting wilder and afford better sport than ever before."

"The park has been visited by Canada lynx, and I am inclined to think, a big family of pumas, during the past year. They seem to come down from the North to the forest in the fall, and return in the spring."

"The number of foxes is being kept down, but in spite of that the small game, grouse and hare, do not seem to increase."

"The 'Cony' rabbit has secured a foothold in the forest (and in all that part of New Hampshire), and, as usual, is driving out the hare. We should, incidentally, be very grateful for any suggestion that would help us in exterminating these small pests."

"The buffalo in the original herd have increased so that they now number some seventy. They are in fine condition, and are being taken care of during the winter. The boar are also being fed. The buffalo which were returned from Van Cortlandt Park have never completely recovered their health, and we have thought best to keep that herd apart from the other."

"I can give you no figures of the number of game in the forest, as it is utterly out of the question to form any estimate of that."

Wm. C. Whitney.

Besides his Berkshire game preserve of 10,000 acres on Washington Mountain, near Lenox, Mass., Hon. Wm. C. Whitney has secured a large tract of land in the Adirondacks. This lies in the neighborhood of Little Tupper Lake in the northern part of Hamilton county, N. Y.

G Lake Preserve.

"The G Lake Preserve is situated in the town of Arietta, Hamilton county, N. Y., comprising parts of Lots 231 and 233, and all of No. 234, Oxbow tract, 620 acres, owned by E. Z. Wright and John D. Collins, of Utica; E. B. Salmon and J. W. Black, of Syracuse, N. Y. It is kept as a hunting, fishing and timber preserve, in charge of a special game protector keeper. All timber is to be kept intact. None is to be removed or cut. All of the lake is embraced. Two cottages are erected and other buildings. Lake covers about 175, water."

William Rockefeller.

Mr. William Rockefeller, of New York city, is one of the most recent additions to the ranks of Adirondack preserve owners. In August last he purchased 25,000 acres of forest land in Franklin county, abutting on Paul Smith's preserve. The property has been lumbered for pine and spruce, but it still has ample standing timber. Mr. Rockefeller's intentions regarding the tract are not definitely known.

P. H. Flynn.

Mr. P. H. Flynn, the Brooklyn trolley magnate, has bought a large tract of wild land, including a lake at Emmonsville, Sullivan county, N. Y., with the intention of creating a game and fish preserve. It is said that he will put up a handsome summer residence on the preserve and stock with native and exotic game birds and animals.

C. Tielenius.

Mr. Tielenius writes of his preserve: "My deer park is getting along satisfactory in regard to breeding elk. Same is situated near Mt. Pocono, Monroe county, Pa.; an 8ft.

fence encloses about 1,200 acres of woodland, rocky or stony and rolling, watered by two small streams. Four years ago I stocked these streams with about 30,000 small trout and placed twenty-eight young elk from one to two years old, from Wyoming (four bulls and twenty-four cows), in the park. The first year the did not breed; the second year I had six young one; the third year thirteen, and this year from twenty-four to twenty-eight, so that the herd consists of about seventy-five head at present. During the summer they are hard to be found or seen, as they hide away in the woods with the exception of the evening, when they come from the mountain tops to the streams for water. During the winter, in severe weather, they are fed with hay at two feeding stations; only then I have a chance to see them all and to find out exactly how many young ones I have from the past summer; they deliver them during June or July. I have no shelter for them in form of barns against frost or rain. They seem to be weatherproof, and rather lay down on the snow than in a barn. Of the bulls, I had four shot, two four and five years old, and two yearlings; dressed, but in their skin, the old ones weighed about 450lbs., and the yearlings 268 and 276lbs. each. I ought to have lots of ruffed grouse and rabbits; however, I am sorry to say that there are too many foxes who destroy them; and the trout are destroyed by mink. I certainly am trying to keep the vermin down in numbers, but it is very hard to follow the foxes through the thick underbrush and a rocky mountainous district, where they hide and breed. I would be very much obliged to you for your kind information in how far the State game laws interfere with private parks. To protect the cows at the coming breeding season I ought to kill four more bulls. But I am not permitted to do so and to bring them to New York now."

"Concerning an Epithet."

Editor Forest and Stream:

My modest little scrawl relative to immoderate game killing and matters pertaining thereto, seems to have brought down a call-down or two in addition to the mild expostulation of FOREST AND STREAM. It also brought out a few stray flings at alleged use of intemperate language in dealing with the subject.

It strikes me that no unselfish, reasonable sportsman can feel otherwise than "hot" after seeing as we do, week after week and month after month, the pages of nearly every one of the papers devoted to field sports, besmeared with the bloody records of intemperate, inhuman, wanton slaughters; records that make one's trigger-finger itch with murderous intent, or cause him to hanker for the enactment of a law that would land some of these evildoers into the penitentiary. Even FOREST AND STREAM—that great literary mecca of the sportsman—is an occasional offender in this line. Only a few weeks ago one of its brightest and most entertaining correspondents told us that he was especially fond of a certain shooters' club because the members thereof limited themselves—a club rule I believe—to a daily bag of fifty ducks, and in the same item we are also told that several of the club members played the limit on many consecutive days, with the addition of a few geese and turkeys on the side. Ye gods! what a transcendently beautiful limit; three hundred ducks in a week barring the Lord's day; about three-fourths of a ton of game birds slaughtered in one short week by one "sportsman" (limited).

One shudders to think of what such a "sportsman" might do with the limit off, and there are "several of him" in the same club. Armour or Swift ought to throw open wide their abattoir doors and doff their hats to such wonderful talent. Do you wonder at the use of intemperate language by any one of your readers who has a spark of sportsmanlike decency in his makeup after having partaken of such an item as the one referred to? My private views on the subject would not, I fear, look well on the pages of FOREST AND STREAM.

Usually the parties who take most delight in having a fling at the poor devils, who, through ignorance, sometimes scoff at the immoderate shooters are themselves confessed offenders in the unlimited killing line and they always offer as a plea for their want of moderation in the field that same old threadbare story "none of our game was wasted, all was used." Robin Hood, Jack Shepherd, and several other celebrities are recorded as having made the same plea; none of the proceeds of their little pleasantries went to waste, all not used by themselves went to feed and clothe the worthy poor. In this connection I beg leave to recall an incident that occurred at Shinnecock Bay a few years ago, where two shooters in a single day killed four hundred shore birds—a large percentage of which were dowitchers—and upon being upbraided for their action pleaded that "none of the birds were wasted, the hundred and odd guests at the hotel ate them all and would have eaten as many more had they been available."

Just such work as this has made the dowitcher a *rara avis*, comparatively, on the shores of Shinnecock Bay.

Of what possible use would be the enactment into law of that most excellent FOREST AND STREAM platform plank, relative to the prohibition of the sale of game, if unlimited killing is to be permitted to so-called sportsmen who might desire to win applause by catering to the never-failing appetites of countless hordes of gourmands at the seaside and mountain resort hostleries? Of what possible use is a law putting restraints on the willful overcrowding of the game bag? Any one who has had aught to do with the enforcement of the game laws knows that the bag limit statute, especially that pertaining to small game, is a dead letter law from way back, and that the only way to prevent unlimited killing by "sportsmen"—prohibition of game selling will fix the market-shooter—is to educate them up to a higher plane. Whether this education can best be instilled by means of moral suasion or with an axe is a matter I leave to those more experienced than I in the moral suasion or hardware business, and will merely say that I have no desire to pursue this controversy further except to reiterate my firm belief that the "game hog" is utterly unfitted for the company of the grand army of FOREST AND STREAM readers, the vast majority of whom are gentlemen and sportsmen in every sense of those badly abused terms, and the sooner he, the g. h., is brought

to a realization of this view of the case, the better for all concerned.

One of your correspondents, Mr. L. A. C., takes exception to my argument, because it seems to remotely connect the crime of larceny with immoderate game killing, and holds that, while there are statutory provisions governing the one, there is no law to govern opinions as to what should constitute a reasonable bag for a day's shooting; in fact, he in effect holds that in this matter every man is a church unto himself. I beg leave to differ with the gentleman; the great unwritten law of "common honesty" governs in these premises as perfectly as does any law on the statute books relative to larceny, although it does not perhaps affix quite so severe penalties. If the unwritten law named is not sufficient to cover the ground, the "golden rule" indirectly applies, as do many other of the teachings relative to moderation and temperance, of the Great Teacher whom your correspondent quotes. Forbearance in dealing with the immoderate game killer has ceased to be a virtue and the day of retribution is at hand.

In conclusion, permit me to have a word at the item in FOREST AND STREAM that hints that want of skill in the field is perhaps what ails me, and suggests "sour grapes." I have been on earth fifty years, a shooter for forty, and, pardon a little egotism, a fairly good wing shot for upwards of thirty, and can hold my own in the field with any of the mighty killers—barring none—who air their exploits in the columns of the shooting and fishing papers. I can work the slaughter racket, but I won't; I have learned better ways.

M. SCHENCK.

Troy, N. Y., March 31.

Editor Forest and Stream:

The stand taken in your paper toward that class of sportsmen who are inclined to call every other one (able to hit his birds) a game hog, etc., finds my hearty approval and also of thousands of others. The best way to make a market-shooter see into the error of his ways would be, to let the well-to-do sportsmen buy unlimited numbers of FOREST AND STREAM and distribute the copies to them, which would tend to educate and refine them into the ways of true sportsmanship.

CHAS. F. BROCKEL.

The Fox (Wis.) Representative, as quoted in your issue of April 1, says: "Two dozen ducks a day is enough for any man to shoot, and a man who is not satisfied with that many is no sportsman." Should any of FOREST AND STREAM readers be "shy" on what constitutes a reasonable bag limit, this might help him out. I had no idea until recently that there was such a want of knowledge on the subject. I was foolish enough to think that every sportsman knew about what constituted a decent limit.

M. SCHENCK.

ADVERTISEMENT.

D. N. & Co.'s Department Store.

Spring Opening—Special Announcement.

WE have an entire new list of spring goods laid in at very low figures, and which, owing to our enormous capital and facilities for obtaining the entire output of all the live stock on this continent, and also of vast importations from Mexico, Central and South America, we can offer at prices beyond competition. We have departments in every county, in every State and Territory in the Union, and send to each department such stock as has been proved to be suitable to the locality.

Trout.

We can offer this season a fine line of brook, brown, rainbow, Dolly Varden and lake trout, in our different departments. Our trout purveyor was among all the State and private hatcheries two years ago, and secured the entire output, in addition to what we produced in our brooks and lakes. The first fruits of his journeys are now confidently offered to the public as the best that can be found on the entire globe.

Trout of 3 and 4oz, per dozen.....2 artificial flies.
" " same quality per dozen.....1 doz. angle worms.
" " over 4oz. and under 1lb.....4 artificial flies.
" " same quality.....3 doz. angle worms.
" " above 1lb.....special rates.

NOTE.—No worms received at par that have not been well scoured in moss for three days. Flies must be up to the standard of the best makers. We will have a splendid assortment of black bass, pike, pickerel, mascalonge, crappies and other fish later in the season, when we will have a full line of minnows for bait.

Wildfowl.

In some of our departments our customers can obtain a full line of ducks, geese, brant and swans at this time of year, but the goods are no longer fashionable in many States during the spring months, and we do not care to do a big spring trade in this line, nor in fact in any bird line in the spring, for economical reasons, which, however, affect our customers more than ourselves. Every sale we make of a pair of birds in the spring lessens our fall trade by a dozen. The same reasons which govern the poulterer in reserving his spring stock are sound, and we wish to follow them. As some customers demand wild fowl in the spring, we quote:

Swan, per single bird.....3 days' labor and 100 cartridges.
Geese and brant, per single bird.....1 day's labor and 10 cartridges.
Ducks, per dozen.....1 day's labor and 60 cartridges.

In the interests of our customers, as well as our own, we hope that the demand for spring goods of this description will become as unfashionable in all of our departments as it is at present in the best of them, where customers realize that our interests are theirs.

Our firm having been established so far back in the remote ages that its records are incomplete, is too well known from the equator to both poles, wherever man in either savage or civilized condition exists, to need references by the transient people now occupying the earth; we have supplied their forefathers for more thousands of years than they can reckon, and are still doing business at

the old stand. It is our business to supply their needs in every line, food of all kinds, material for fuel and clothing, medicines of more or less value, minerals of all known kinds, and the raw material for many other things, therefore we think that our advice, which is based upon an experience greater than that of any living man, should be considered seriously.

We would like our customers to go on with their breeding of domestic animals, which, under individual ownership, are treated on business principles, and are not slaughtered in the breeding season. Of course this cannot be done in the case of the shad and some other fishes which only come within man's reach when they go to the rivers to breed, but, as all intelligent communities forbid the killing of deer, grouse, quail, woodcock and other wild life during the breeding season, which includes the time of pairing, our firm does not understand why this principle is not applied to wild fowl and other birds.

Once we had on our bargain counters buffalo meat and tongues, wild pigeon and beaver tails. We cannot offer them to-day, because they have not been allowed to live and multiply. The intelligent farmer preserves enough breeding stock to supply his wants. The intelligent Commonwealth should do the same thing. If this could be done all over the land, we could promise more liberal terms, per cartridge, in the fall than it is possible to do now. If we may be permitted to advise our customers concerning fashions to come, we will say: In a few years the sportsman will take up his gun in the woodcock season, say August and September, and in the latter month will look for grouse, quail, wildfowl, shore birds, rabbits, deer and other game until the new year. Then he will clean up and oil his gun and lay it away until the next woodcock season, unless he desires to shoot clay pigeons, which we do not furnish. Then he will sit in the chimney corner o' nights and read what has been published on his favorite sport until the sun comes so far north that it shines on the rod case on top of his books. Then he looks over the whippings on his rod, tests his leaders, examines his fly-books for moths or abraded gut at the heads of the flies and awaits the opening day for trout. After this comes other fishing. Speaking as a business firm, we will say that our very best customers are those "all-round sportsmen" who love both the rod and the gun, and who are happy if they can fish in spring and summer and shoot in the fall. Some men do not care to fish at any time, and it is this class that demand that we should have wildfowl on our counters in spring, but we are glad to say that the demand for wildfowl in the spring months is decreasing, because intelligent gunners realize the fact that they cannot kill a pair of ducks in the spring and expect them to bring down a brood in the fall.

We have spoken plainly on this subject to our customers, because their interests are ours, and, having had centuries of experience in purveying animal life for man, and having seen him waste and even annihilate some species of it, we venture to make the above suggestions.

Very respectfully,

DAME NATURE & Co.

N. B.—No goods sent on approval. Our customers must come and get for themselves what they want.

Some African Hunting Experiences.

Editor *Forest and Stream*:

Towards the latter end of 1898 a book was published by Mr. Greener, the gunmaker, entitled "Fifty Years in South Africa." The author is an Englishman named Nicholson, who states that "Varied by an occasional visit to England and other parts of the world, the greater portion of half a century has been passed by me under canvas on African soil. * * * My wanderings of more than thirty years ago had made me acquainted with immense tracts of the countries bounded to the north by the Lambesi, to the west by the 'Great Thirst Land,' and to the east by the Indian Ocean."

Although the author hunted for a livelihood, his narrative shows that he was a thorough sportsman in the best sense of the term; never killing game except for food or to obtain ivory and valuable skins. The ideas of a man of such wide experience as to the best weapons for wild sports will, I feel sure, be interesting to many of the readers of *FOREST AND STREAM*, and may also be useful to Americans contemplating a shooting trip into the interior of Africa.

The author began large game hunting about 1845, being then armed with a double flint and steel smooth bore by Purdy. The gauge is not mentioned but it was probably No. 12 or 14, the latter being the favorite size in England at that period. With this weapon he killed elephants, zebras, various kinds of antelope, and lions. Twenty-seven of the last named were bagged in seven days during one hunting journey in the present Orange Free State. On this subject he says: "So numerous were the lions, that, on one occasion near the Kafir River, I counted over forty of all sizes in a single troupe. * * * My impression is that the safest and most effectual method of lion hunting is alone, with a gun bearer carrying a spare weapon or with one trusty fellow-hunter, and I have never had occasion to complain of the behaviour of a native attendant, if isolated from companions of his own race. And here I may remark that although I have been in many tight corners when hunting lions, I have never been mauled, nor has any casualty befallen any of my 'boys' on these occasions."

In 1850, when hunting for guinea fowl with a No. 15 smooth bore muzzle loader, by Beckwith of London, he saw a lioness with two cubs, rammed down a bullet on the shot, and crawling over a rock on which she was lying ready to rush at him, fired between the shoulder blades. The bullet and shot charge "smashed the backbone and made a terrible mess of the contents of the chest." The cubs were caught, put into a strong cage made in the bush, and some months afterwards were sold for fifty guineas to an American shipper at Port Elizabeth.

During his wanderings Nicholson became acquainted with Dr. Livingstone, and also the celebrated hunters Gordon Cumming and Oswald. Livingstone is described as "a little, dark, tough-looking man with a countenance every lineament of which denoted the possession of courage, pertinacity, and intellect." Cumming was, he says, a mighty hunter, but handicapped for such game as

elephants and rhinoceros "by his weight in the saddle and his habit of using a rifle, that weapon in those days being very inferior to a smooth bore, as it could not be used with a sufficient charge of powder to ensure the necessary amount of penetration." (He evidently means that the grooves of the British sporting rifles of that period had too quick a twist to allow of a heavy charge of powder without causing the round ball to strip. Those which I have examined have had one turn in between 30 and 48 inches for ball of 10z. weight, which were very liable to strip if more than 2 to 2½ drams of No. 6 grain powder were used.) Many people in this country, and probably in America, thought that some of the adventures described by Gordon Cumming were too improbable to be believed, but this author says "I don't think such was the case; none of his performances in the hunting field amounting to much more than usually fell to the lot of most sporting wanderers in the same localities." In justice to Cumming it should also be mentioned that Dr. Livingstone, who knew many of the natives employed by him, vouches for the accuracy of his descriptions.

Of the hunter Oswald, Nicholson states, "he was a very light weight, a splendid horseman, always well mounted, and invariably shot with a smooth No. 10-bore, which, in his hands, made short work of all kinds of big game. * * * A grand specimen of a thorough, cultured, English gentleman, brave to the verge of temerity, but brimming over with kindheartedness, courtesy and geniality."

Among other weapons used by the author was a single muzzle loading duck gun (bore not stated), altered from flint to percussion lock, and weighing 14lbs. Of this he writes: "I shot an immense quantity of game with it, ranging from elephant to the small steinbuck antelope, and lost very few animals wounded by its large spherical bullet, which it shot accurately at quite outside distances."

In the advice to those in search of foreign sport Nicholson says: "I have observed that men intending to obtain it usually encumber themselves with batteries as expensive as they are superfluous. In all wild countries it may be taken for granted that transport is more or less difficult, imperfect, and expensive; and the obligation to be constantly on the alert to watch over the safety of a costly battery soon becomes intolerable, and a waste of energy in a profitless direction. * * * Having used nearly every kind of weapon of portable dimensions from the flint and steel days up to 1894, perhaps I may lay claim to some practical knowledge of the subject. * * * Of weapons for the native hunters he states: "Upon the whole I have found it better to arm any of the 'boys' who may have the wish or ability to shoot, with plain single barrel smooth bore guns; with rifles they get into the habit of blazing away at all kinds of distances, and waste ammunition; besides, by giving them a shot cartridge or two, they often bring in a toothsome bird for the larder when one is saturated with dry antelope meat. Such guns can be bought for about £5, and should be sighted for ball shooting up to one hundred yards."

Too much of your valuable space would be required for all the remarks about weapons made in various parts of the book, but the most important ones are as follows, the author's own words being sometimes quoted:

1. Owing to the great improvements in modern rifles, a sportsman need no longer be encumbered with very large bores and their correspondingly heavy ammunition. A ball and shot gun of the Colindian or Paradox type is very satisfactory if of 12-bore, and heavy enough to carry 4½ drams of powder easily. A double rifle of 9½lbs. weight and one of these guns of 8lbs. is an excellent armament for any part of the world and for any kind of game.

2. "Barrels of sporting rifles need never exceed 26in. in length, both on account of handiness and because short guns can be held much more steadily than long ones when aiming, especially in high winds." Aim can be more quickly taken, in running shots, if the stocks have a good bend. For a man of 5ft. 10in. a 3in. bend is not too much.

3. A first rate double barrel is the best and most reliable rifle yet invented, but, if economy be an object, the Winchester repeaters are efficient weapons.

4. Although all soft-skinned animals may be killed with the ordinary short express bullet with its large hollow, its want of penetration makes it fail for general purposes. It is often necessary to fire raking shots at the sterns of good sized antelopes, when a large superficial wound is the result. "with which the poor animal usually escapes." With solid bullets at such game express rifles are excellent.

5. Elephants, rhinos, and similar thick-skinned game fall readily to the bullets of a 45-bore, but it is not good for animals below a certain size, say three hundred weight, because they do not offer sufficient resistance to cause the expansion of the bullet and a large external wound. There is little or no blood spoor to enable the hunter to follow a wounded beast, and almost all African game, except the eland, has such extraordinary vitality that it is liable to escape although mortally wounded.

6. After a sufficient trial of small bores the author reverted to .577 gauge rifles and also to 12-bores, both rifles and specially made smooth bores, "for all kinds of game with satisfactory results. A rifle of .577 gauge and 10lbs. weight is a very efficient weapon."

7. A .577 rifle does not require more than 4½ drams of powder nor a 45 more than 85 grains. For all except elephant or rhino shooting "smaller charges are preferable, giving quite sufficient penetration, being less liable to cause a premature breaking up of the bullet and minimizing recoil."

7. It is very important to have rifles chambered for straight tapered shell as they can be reloaded a great number of times without resizing. Bottle-necked shells very much increase recoil and have to be resized after every shot. The necessary swedging tools for this are very liable to be mislaid or lost. Unless reloaded, a cumbersome quantity of the shells must be carried.

8. A white-tipped foresight is the best of all, and enamel is preferable because ivory is liable to shrink and drop off in hot, dry climates. The rear sight should be as black and dull as possible, as a platina mark in the center is apt to spoil the aim by dazzling the eyes in a glaring sun.

9. The very best South African game shots I have known, have restricted themselves to a single standard sight for all sporting distances. "Only the 100yds. sight

is necessary, for game should not, as a rule, be fired at beyond 200yds., and very little indeed is killed beyond 150 by even first rate shots, no matter what rifle is used. Firing at longer distances than 250yds. entails much unnecessary cruelty."

10. With regard to the new rifles of about .300 gauge with smokeless cartridges and metal patched bullets, their accuracy, flat trajectory and penetration are admitted, and they are considered good for the defensive purposes of an exploring expedition when the weight of ammunition has to be economized. The objections to them are that a few months' hard work causes the grooving to wear away to such a degree as to make their accuracy unreliable; and that they are very difficult to clean, their extremely rapid twist and small bore "retaining and packing the fouling to an inordinate degree." Their long range is of no importance for game shooting. "After the exertion entailed by a gallop or stalk, no man is fit to shoot with tolerable accuracy at more than point-blank distances."

11. As to the various ways of boring, Mr. Nicholson remarks: "I have shot with all kinds of rifles, and have a decided preference for the smooth, oval-bored weapons on Mr. C. Lancaster's principle; which are quite as accurate at sporting distances as grooved rifles, retain their shooting qualities indefinitely, foul and recoil very little, and are especially easy to clean, besides being available with shot when expedient." "They stand rough wear and neglect much better than any grooved ones. * * * and what fouling there is, is evenly distributed over the inside instead of packing in patches, as is the case with all grooved barrels more or less." It appears to me that if some of the manufacturers of repeating rifles would try the oval bore system, they might produce weapons exactly adapted for the woods' loafer, or for hunters who are obliged to subject their rifles to neglect and rough work. Some years ago the editor of the *London Field* reported a trial he had attended of an oval bore .500 express. He said the wind was so strong that Mr. Lancaster had much difficulty in holding the rifle steady, but, allowing for that, the accuracy was very good.

I lately measured the bullet holes in a target shown me as having been made by a double Lancaster oval bore, chambered for the .303 army cartridge. The four shots of the right barrel were in a square 2in. wide by 1 1-10in. deep, and the four of the left in 3 3-8in. by 1 9-16in. The whole eight were in 3 3-8in. wide by 1 7-10in. deep. That is certainly good for open hunting sights even from a rest.

Last summer a friend who owns a double oval-bore, of 16 shot gun gauge, brought it for me to examine. There was no safe range available beyond 50yds., but at that distance its bullets were quite accurate. Being doubtful about the truth of the claim as to its being really useful with small shot, I loaded some 16-bore shells with 2½ drams of powder and 10z. of No. 6 and tried them at forty measured yards. I was surprised to find the patterns not only as close but as regular as those of a good average cylinder bore shotgun.

Mr. Nicholson's remarks about smooth bores will be new to many of your readers, as they were to me. He considers that there is not much practical difference between the killing powers of guns from 20 to 12 bore unless the latter be heavy enough to carry 4 drams of powder and 1½oz. of shot. He seems especially fond of 16-bores, and says: "With a 28-bore I have killed satisfactorily, small antelope, geese and wildfowl, besides several large bustards, with shot of suitable size, No. 1 for choice; but, as it was an extra stout little weapon, I used 2 drams of powder, Curtis & Harvey's No. 4, and the same measure of shot."

"The cylinder barrel of any well-bored double gun with a suitable quantity of metal, if fitted with a folding leaf sight on the rib, and loaded with a thick, soft wad below a hardened spherical ball, will, if the bullet is a close but not tight fit, shoot accurately enough to hit anything of, or about, the size of a rabbit at 100yds." He states that some years ago, with a strong double muzzleloading smooth 16-bore, fitted with a rear sight and front ivory sight, he bagged forty-three buffaloes in a few days, very few wounded escaping, and several being killed by raking shots from behind. A 12-bore of 9lbs. weight, with 4½ drams of fine powder and hard bullets, gave ample penetration for large bull elephants.

By "cylinder barrels" I think he must mean true cylinders, not those which were made to throw small shot well by "opening" at the muzzle, or, as in breechloaders, by compressing it slightly. I have tried numbers of such guns loaded with ball in various ways, and the best of them would not carry accurately enough to be certain of hitting a deer in the thick part of the lungs beyond 60yds. About ten years ago a letter, apparently by the same author, was published in the *Field*, describing a ball shooting smooth bore in similar terms to those above quoted: It was a 12 gauge 8lbs. weight with very rigid barrels, one of which was "a perfect cylinder, specially bored with the greatest accuracy to throw ball." It also had a fixed rear sight like a rifle. I can quite believe that such a barrel might throw ball with the accuracy described. About twenty-four years ago I had a double muzzleloader carrying forty-three round balls to the pound, with a thin patch. It weighed 5½lbs., and had very thick barrels up to the muzzle-bored true cylinders. Finding it very accurate with ball, I fitted a rear sight on the rib, and then found that it would put a succession of shots into one page of the smallest size notepaper at 100yds., carrying point-blank to that range with 48 grains of No. 2 Curtis & Harvey's powder. Of course, it scattered badly with small shot, so I reserved the left barrel for ball, and, with some emery powder, opened the muzzle of the right until it made a close pattern up to 30yds. with ½oz. of No. 9 and 35 grains of No. 2 powder. I kept this little gun two or three years, during which it never made a wild shot with ball. A half-caste manager of a tea plantation in the Himalayas fell so much in love with it on account of the small quantity of ammunition required, that I sold it at a moderate price, less than it cost.

I will conclude with a few quotations well worth the consideration of those now commencing their sporting careers:

"The almost universal use of small bore rifles (inclusive of .450 bores) has played the mischief with the game all over the country, without, I think, increasing the num-

ber of animals actually brought to bay." * * * "One is often tempted to fire a lot of risky and ineffectual shots at long range and without taking sufficient pains to obtain a fairly certain shot." * * * "In the interests of real sport it would be advisable, where a rule can be enforced, to prohibit the use of small-bore, long-range rifles altogether."

"A formidable amount of aggregate skill in the use of their weapons was a noticeable characteristic of the Boers of the period I allude to (say twenty years ago)." * * * "Since the general introduction of long-range breechloading weapons, their shooting powers have steadily deteriorated." * * * "Indeed, ever since the modern rifle came into general use in the Transvaal, the Boers have gradually lost that amount of skill upon which their prestige was founded in former days." * * * "The extreme ease with which breechloading rifles can be loaded, and the long range of these weapons, contributed largely to the deterioration of their original skill, by inducing habits of carelessness as to distances, and a preference for pumping a stream of lead into the 'brown' without much regard to aim. This soon makes the game animals very wild, and, in proportion to the number of cartridges expended, very little game is gathered, and an enormous waste by wounding occurs."

"In the late combat with Dr. Jameson's raiders, the Boers fired from behind rocks, which protected them completely from the effects of the horizontal fire of the enemy, whom they could pot at on an exposed plain on which marks indicating distances had been placed." * * * "With all this in their favor, these burghers were only able to kill twenty-two of Dr. Jameson's men, in addition to a few minor casualties, with an expenditure of at the very least 6,000 cartridges."

There could not be a more striking illustration of deterioration in skill caused by the facility of reloading modern rifles. Of course no one would now think of using any others, but it is not overstating the case to say that, even when armed with the most quick-firing repeaters, every shot should be fired with the same care as was practiced when muzzleloaders were used. We should then find that not only would fewer animals escape wounded, but that the shocking instances of men being killed in mistake for deer would be unknown. Firing at moving leaves on the chance that a deer may be behind them was never heard of in muzzleloading times.

J. J. MEYRICK.

SOUTH DEVON, England.

CHICAGO AND THE WEST.

Check for Illinois Game Bill.

Last week I had occasion to mention the rapid progress of a dangerous measure which bade fair to get through the Legislature of this State, namely, Senate Bill No. 43, otherwise known as the Begole bill. At that time I made mention of the undesirable features of this measure, although stating that the bill was being railroaded and might perhaps reach passage. It did come up for a vote in the Senate, on last Tuesday, March 28, and came within two votes of passing. There were fourteen votes for the measure and sixteen against it. Mr. Begole gave notice of a reconsideration. There is little doubt that every effort will be used to push this thing through. There is a House bill already introduced which is almost as undesirable as this Senate bill, and the sportsmen of the State cannot be too urgent with their representatives with the request that they keep alert for these or any other sweeping measures which look toward the wiping out of our old game law with its well-tested sections.

What we need in this State is not so much better laws as better enforcement of the laws, a statement which applies indeed to all the western country. These new measures contain some good points, of course, but to have them take the place bodily of our former laws would be no gain but a distinct detriment to the people of this State. We do not want any more laws which help South Water street. Any Illinois law which does help the commission men of this city is a distinct hurt to every western State which has any game left to ship. Let us hope that Senate bill No. 43 and all its counterparts will fall by the wayside and rise no more.

The Feud on South Water Street.

The feud inaugurated against Warden Loveday by the Packer and National Produce Review, the alleged organ of South Water street, has taken a distinct and rather ugly form. The paper quoted comes out in its issue of March 25 with further distinct charges of illegality on the part of different game wardens, including the present one. It charges that it has been the common custom among the justices of the peace of Chicago not to turn in any funds to the school board, as directed by the law. Auditor Custer, of the city school board, is reported to have said that during his term of office, covering about fourteen years, there had never been any money turned into the school board from game prosecutions. The Review openly charges that neither Warden Blow nor Warden Loveday has ever turned in a cent. Justice Randall H. White states that he has turned over such funds properly, or stands ready to do so.

These are but part of the intimations made by the paper above referred to. That the war has taken definite shape may be gathered from the fact that President Graham H. Harris, and Attorney McMahon, of the Board of Education, have this week conferred for the purpose of deciding whether or not to file suit for the collection of fees, estimated to amount to several thousand dollars, which the school board claims belong to it, but which have never been turned over under the provisions of the law. It should be borne in mind that these funds are properly to be paid over by the justices of the peace, though I presume the records of the warden's office should tell the amount and dates of all such collections.

I do not know whether or not there is any personal spite actuating the paper above mentioned in its course, and to be sure, both sides of any case should be given in a paper like the FOREST AND STREAM. As I am unable to meet Warden Loveday at present, I hope he will send to me any statement which will give the facts upon the other side of the case. The Review should give chapter and verse, names and dates and not content itself with sweeping as-

sertions. It is in a splendid position to expose a lot of the rottenness of South Water street, having much better access to the dealers than any sportsmen's paper could ever have. If it is sure that hush money has been paid to any warden, it will do a service to all dealers and all sportsmen also, if it will print the names of any firms which have contributed such hush money, stating the amounts of such contributions, with the dates and circumstances. This is a sort of information which I have long been anxious to get during the administrations of earlier wardens, but it is something which no stranger can obtain on South Water street. I once spent a little money in trying to get some facts of this sort, but failed. If the Review can secure these facts, and be sure that they are facts, I should for one be very joyful. It is not right, however, to deal in innuendo or general charges, and the only right kind of journalism is that which is willing to get both sides of the story. For Warden Loveday, personally, I must say that he has been more effective than any warden we ever had, out in the shooting districts, and that he has seized more game on South Water street than any other warden ever did. This I do not take to mean that he has stopped one-thousandth part of the illegal game trade of South Water street. I admit that it is my personal belief that a game warden belongs on South Water street, and not outside the city, and I think that he ought to have a large, active hammer and nail puller always about his person. Perhaps, if I were game warden myself, I would know more about this sort of thing, and could testify to the shrewdness of the great game fences of Chicago, which are forever open to the stolen game of the West. It may be mere spleen on my part, yet I confess to a sort of rage, in which I think perhaps I am joined by many others, that this gigantic system of theft and robbery should go on almost openly under our eyes, and that the machinery of our laws should fail so utterly to reach and check it. It almost makes the word law a mockery. If anyone thinks for one second that no illegal game comes into the Chicago market, or goes out of it, he is in a state of ignorance deserving pity. Yet this thing goes on, and we know it goes on, and we cannot, or do not stop it. I would like to see the Review, as the commercial organ of the street, rip that whole delectable thoroughfare up the back at the same time, while it has out its knife for the officials who have failed to accomplish that purpose.

The Elk of Jackson's Hole.

A while ago I had occasion to print a communication from Mr. Edwin F. Daniels, of this city, describing the unsportsmanlike slaughter of the elk in the Jackson's Hole country by Eastern shooters. For the most part one does not expect to have his hopes and wishes regarding game protection realized, and to make a howl in a newspaper over the slaughter of game usually does little good excepting to make the howler feel a little better at the time. I do this sort of thing chiefly because it makes me feel good, not because I think it jars the world very much. Yet here I have another letter from Mr. Daniels, which would show that this subject has really attracted some attention in the country where the most good can be done. Mr. Daniels is good enough to write me as below:

"My letter to you of recent date relating to the slaughter of big game in Jackson Hole country last fall by prominent people, has had a little effect. It has been read in Wyoming, and I am in receipt this morning of a letter from Simpson Bros., of Jackson, Wyoming, relating to same. This letter fully confirms my previous information, regarding the slaughter. I quote from Mr. Simpson's letter as follows:

"The slaughter by them was awful. Their guide was —, and if ever they should return to the hunting grounds of Wyoming, they should receive summary treatment and dismissal."

"I am glad to note that the matter has reached the right place, and I trust that the efforts of your paper may be so well directed that it will not be allowed to rest here, but that a sentiment may be created in that particular locality that will not fail to make known the fact that such slaughterers in the future will not be tolerated."

"Mr. Simpson says, however, that he is not in sympathy with my view in relation to the residents of the game country being held less liable than the sportsmen from the East. He says he thinks they should be held more liable. I am very glad to note this sentiment from a resident of that country, and I hope that it is widespread and general among the people who live there. From what Mr. Simpson says, I gather that there are, however, some exceptions, and that there are several of what he pleases to term 'hog hunters' who live there. These people will always be found in such localities, and the only thing that can be done is to watch them as carefully as possible, and then pass laws stringent and comprehensive enough to make it a misdemeanor for them to kill more than a certain amount of game, or more than is necessary to furnish meat for their actual use."

"I hope that the reports of the death of thousands of elk, deer, etc., by starvation, is greatly overdrawn, although I doubt not that immense numbers have died from that cause. While at the Lake Hotel, Yellowstone Park, last fall, I met Lieut. Lindsley, who had just been on a scout of 500 miles, and was just about making his report to the Government regarding the condition of game, and their summer and winter ranges. If the starvation story is true, Lieut. Lindsley's recommendation that the Government take into the forest reserve the entire Jackson Hole country far enough so that in the severest winter weather, the game could have a winter range where it could feed, should be adopted at once. This protection would afford both a summer and winter range, and would make it practically impossible for any great number of deaths to occur from lack of proper food."

"Lieut. Lindsley told me that his duties to the Government in the fall and winter of 1897-98, brought him into such close proximity with the game, that he personally saw forty to fifty thousand elk moving from their summer range in the Park to their winter range in Jackson Hole, where, owing to the lax protection in that country at that time, many thousands of them were indiscriminately slaughtered."

That's right. Put a park about them. And incidentally, put a 40ft. stone wall about the park.

Western Game Prospects.

From all I can learn the quail have had a hard time

in Minnesota and Wisconsin, not quite so bad a time in Michigan, Indiana and Illinois. In parts of the South they have suffered a great deal. I do not feel qualified to say how they have fared in Iowa, Nebraska and Kansas, though I am sure the winter has proved more than ordinarily severe pretty much all over the West. In this latitude the weather has been wretched. During the entire month of March we have had only five pleasant days, and it has rained or snowed almost every day for weeks. To-day, April 1, it is cloudy and snowing, at a date when the leaves ought to be sprouting and fish running in the streams. Of course, the quail do not benefit by such severity of weather, but it is very comforting to state that the sum of all reports is far from indicating any widespread cutting down of the stock of these birds. For instance, Mr. W. B. Wells writes me from Chatham, Ontario, along the shores of Lake St. Clair, that the quail have wintered there almost without loss, and now seem fat and strong.

Mr. Wells also reports geese and ducks coming in over the marshes of that country. Now and then he says someone goes out after geese. In our locality, as earlier reported, the first of the flight has been up for several weeks, and some of our shooters got very good bags of birds a month ago. I am disposed to think the weather will render the flight rather long drawn out and straggling. As to the jack snipe, no one wistest where they are.

E. HOUGH.

1200 BOYCE BUILDING, Chicago.

Maine Guides and Game.

MOOSEHEAD LAKE, Me., March 28.—*Editor Forest and Stream:* I've been to New York, seen the Sportsmen's Show, the green grass and "spoutin' fountings" in the parks, a forest of big "buildin's," and a lot of men and women and children, who, mostly, look as if they never had seen the sun rise and needed an "airin'."

There ain't any green grass nor "fountings" down here yet, and it looks as if there won't be for a month to come. Also, there ain't any "big buildin's," so when I think of that it seems to sorter square up for the green grass.

But there is 7ft. of snow in our woods, 26in. of ice in our big lake—more than we shall need all the coming summer—and it looks as though the fishing season will be a little later than usual.

Our big game has wintered well. There has hardly been a day all winter in this big country when a man could run down a moose or deer on snowshoes. Not that a man would do so if he could, but some people never do get to be men, and we have a few such critters here. I've been a great deal in the big woods this winter, and never saw better prospects for a good hunting season.

Our caribou ain't all dead neither. I know where there are eight in one band. Now that the law is on them for six years to come, won't them eight caribou laugh and grow fat and wax mightily in numbers if the commissioners and wardens do their duty. In six years that single band of caribou will increase to fifty head.

I know our moose and deer are increasing each year. I meet deer right in my backyard in this village on the shore of Moosehead Lake, and last fall a big black bear walked across my garden—while I was away, however—and crossed the main road to the Bangor & Aroostook Railroad station. I guess he was lookin' for a free pass!

When we guides see moose tracks, and moose, too, in most every section of our big territory, and even in places where we never before saw any, does it indicate that moose are growing so scarce, they are getting so anxious about it, that they are coming out to be counted! Or does it prove that they are spreading out into new feeding grounds, to get enough browse to keep in condition. Each year more are legally killed by visiting sportsmen, and how would that be so if there were not more each year to kill? Take my word for it, and of our guides as a body, that our big game is still on the increase. And what is more, we guides of Maine intend to keep it on the increase. In the past five years we have learned a lot about game protection; we've been getting to the point where we know that a live moose or deer in the woods is worth more to us and to the State than a dead deer or moose in our camp door-yard. And we know now that just so long as we have the live moose and deer, we will have a whole lot of nice gentlemen—and ladies, too—coming down here to hunt them, and paying us boys those three nice big dollars each day we are with them—just for company's sake, I suppose. So it has come to pass that you now hear the voice of one literally crying in the wilderness, in these latter days, saying in a loud voice to all the great throng of FOREST AND STREAM readers: Behold, the registered guides of Maine are in favor of game protection, for they know on which side their manna is buttered, and locusts and wild honey don't infest this wilderness, and the trout hog and game butcher must go! Yours for health,

ED. HARLOW, Registered Guide No. 92.

Capt. T. C. Barker writes from Camp Bemis: "It looks pretty wintry here in Maine. There must be 4ft. of snow on a level; and some drifts about my camp are all of 25ft. deep, so you see that the April rain will have something to do to take the snow off. I have made a sixteen-mile snowshoe trip to-day taking in the Birches and Upper Dam, and it seems mighty good to get onto them once more."

A wild duck killed by a farmer, brought in and sold on the streets, was dressed in the restaurant of Frenchy's saloon a few days ago, when a fish measuring 12½in. long and 3½in. wide was found on its inside, as perfect as if swallowed only a short time before the duck was shot. It had gone down tail first, and while its head was in the duck's craw, the tail was at the extreme end of the bowel. But what bothered those who saw it was how a fish 3½in. wide could go down the duck's throat when its throat was apparently not large enough to admit of the passage of one an inch wide. The fish was of the tooth herring or "skipjack" variety, but what family the duck belonged to none seemed to know.—Frankfort (Ky.) Roundabout.

The Rock Springs Lumber Company.

ROCK SPRINGS, Wyo., March 27.—*Editor Forest and Stream:* Referring to an editorial which appeared some time ago in your paper regarding the alleged killing of game by our company, we wish to state to you the exact facts in the case. Regarding the charges made against our company, our foreman at the camp writes us that he made use of a few elk during the open season, but that since Dec. 1 there has been no wild meat of any kind used by the company, although the tie choppers, and some others working for us, who are boarding themselves, have killed a few elk for their own use since that time.

You will easily appreciate that it was impossible for us, as a company, to stop this killing of elk by individuals, and as both Mr. Kendall, our president, and myself, were very anxious to have the law enforced, and this killing stopped, we wrote Mr. Schnitzer, at Laramie (he was then State game warden), saying that if he would have a deputy game warden appointed to stay at our camp, we would be willing to pay a portion of his expenses, if necessary, to secure his appointment.

Mr. Kendall and myself are strongly in favor of any measure that will more fully protect the game of our State, and were among the few active sportsmen who were instrumental in having a much more rigid game law passed at the last session of the Legislature.

I intend making a trip to our camp some time this week, and the State game warden, Mr. Albert Nelson, is coming with me, for the purpose of making a full investigation of the game question.

Of one thing you may rest assured, that whatever may have occurred in the past, it was without the sanction of the officers of the company, and we intend giving every possible assistance to the game warden and his deputies to enable them to enforce the law to the fullest extent from now on.

A. M. GILDERSLEEVE, Vice-Pres. and Sec'y.

Snowshoe Filling.

FOX POINT, Ont., March 30.—*Editor Forest and Stream:* Having made and used snowshoes for twenty-five years I may be able to give some of your readers a hint as to how the shoes should be filled to prevent "sagging" in wet snow.

I have tried nearly every kind of filling, from cowhide, horse, moose and caribou to bear and beaver; but must say that cowhide (two or three-year-old heifer) is the most serviceable. Caribou is good, but too thin for real hard work, only making a nice light shoe for snowshoe parties and such like. The others are not worth weaving in a pair of bows; unless it is a case of "Hobson's" choice. I cut my filling lengthways of the grain; that is splitting the hide down from nose to tail, cutting the strips straight, and on no account round and round, as wherever cut across the grain it will stretch every time it gets wet no matter how much it is pulled through bone or stretched around stakes. It must be soaked soft to weave, and in doing that the hide will again contract, when after wearing one's weight stretches it and makes it loose.

I find the best way is to have my filling as soft as possible, and then weave it in as tightly as I can, and I've always had a snowshoe that won't "sag."

I'm afraid if you were to get a pair of snowshoes for \$2 here they would hardly last to walk out of the store with; for from \$3.50 to \$6, about \$4, one can get a good serviceable pair. If I've not made myself very clear, I shall be most happy, on the receipt of a line, to answer any inquiries.

SALMO REX.

Adirondack Deer and Snows.

WOODSMEN who come into the city from the Adirondack region since the snow storms of the last two weeks, report a peculiar state of affairs as regards the deer in that part of the State. The animals are starving by scores, simply because the snow is so deep they cannot get through it to the moss and grass. This condition of affairs, which defies the best the game laws of the State can do for the animals, is not confined to any one locality, but extends through all that section where the sun gets but little chance to melt the snow, and where banks of it are often found when spring is far advanced. Loggers and other people whose work takes them into the forest for any distance are repeatedly reporting the bodies of deer lying stiff, and in repeated cases it has been determined that they died of starvation.

A righteous indignation has been aroused in the ranks of true sportsmen by reports that State employees along the reservoirs and feeders have been allowing their dogs to run loose and worry the deer. Here is found a case where the destruction will be many times as great, and for which there is no apparent remedy. At present there is 6 ft. of snow on the ground in many parts of the woods, and in the settled parts 4 ft. is the rule. This will not melt sufficiently to relieve the deer in several weeks, and the death rate among the animals will probably increase with every day.—*Utica Press.*

Properties to Rent.

THE advertisements of fishing and shooting properties for sale and to rent found in the columns of FOREST AND STREAM no doubt appeal strongly to many of our readers. They cover a wide range, from cattle ranching and big game shooting down through birds, to angling, and the properties advertised extend from Canada to Colorado, and from North Carolina to the Rocky Mountains. The hunting lodge advertised by Mr. Edmond Kelly offers peculiar attractions since it is so completely equipped that he who should rent it would be obliged to take with him nothing except his personal clothing and some provisions. The accommodations are large enough indeed to admit of two or three friends or families joining hands to occupy these quarters together through the summer.

The new State game warden of Wyoming is Albert Nelson, of Jackson.

Sea and River Fishing.

To My Trout Rod.

DEAR comrade of my blissful hours,
New joys again we'll borrow;
If skies are clear or weather lowers,
We seek the brook to-morrow.

Where you and I, my comrade dear,
Have wandered far together,
In many a happy bygone year,
In every kind of weather.

For dreary skies we cared no rush,
And oft despised their warning;
And if they smiled, then with the thrush
We trilled a song at morning.

And where was care when we were out
And by the stream a-fishing—
Save when we hooked the day's first trout
For more we fell a-wishing?

Again, old friend, with cheery pluck
We'll fling the barbed feather;
Kind shade of Walton! grant us luck,
And we'll not mind the weather.

GEORGE DOUGLAS.

Fishin' Time's Come.

BY FRED MATHER.

ALTHOUGH the almanac has insisted that spring was close at hand the east winds, with their fog and chill along the coast, have not encouraged us to put much faith in the calendar. The surest sign of spring that I have seen, notwithstanding the robins, blackbirds and the blooms of the daffodils and the skunk-cabbage, referred to two weeks ago, was several flounder fishermen crossing Fulton ferry a few days ago with their short, stout rods and their peculiar double-lidded green baskets well filled with flounders from Jamaica Bay, Long Island. The early birds are so anxious to get into their old homes in the orchards and swamps where they were bred, that a few sunny days is cause enough to break camp and start for the North. Not so with the cold-blooded flounder, which has been buried in the mud all winter; it takes time and many warm days to stir up his appetite for sand-worms, and when the flounder comes forth, he does not go back as the bear and the ground hog are said to do, if their shadows are in sight, or out of it, I forget which. But, after seeing the baskets of flounders the hum of trolley cars sang, all the way home:

"Spring time ob year am come at las',
Ole wintah he'm done gone an' pas';
Fo' an' twenty boatmen all in a flock,
Down by de ribber an' a-fishin' off de dock.
Den dance, de boatmen, dance;
O, dance, de boatmen, dance.
Dance all night 'till de broad daylight,
An' go home wid de gals in de mawnin'."

For several days after the flounder episode this verse took possession of my brain and every thought had somehow to be brought into its rhythm. This is not an isolated case, for often some air, not necessarily a favorite one, will serve me the same trick, until I am weary, but cannot banish it. No doubt others are also plagued in this way.

Spring starts other things out of the mud beside flounders and snapping turtles. Unfortunately, it awakes persons who think they are poets, and they inflict lines, not 12 or 18-thread Cuttyhunk, nor water-proof silk, upon the public, and the temptation is strong to do it. Here is a bit that I once ground out mainly to show my knowledge of scientific terms, for there seems to be no other reason for its existence, and is merely reproduced as a "horrible example."

Spring.

Now the adolescent homo
Seeks Lumbricus in the shade,
Toiling in paternal garden,
Deftly turning earth with spade,
While the Harporhynchus rufus
Chants his lay in yonder glade.

In this phrase I seek to tell you
That the boy is digging bait
For Salvelinus fontinalis
Near his father's garden gate,
Heedless if the school-bell ringeth
Or the teacher marks him late.

But I see that I've neglected
Adding foot notes to each term,
Hence I'll try to be explicit,
And call on science to affirm
That the Latin name Lumbricus
Is another word for worm

Salvelinus fontinalis—
There is not the slightest doubt
Boys from Maine to California
All would join in mighty shout,
Laughing at your lack of knowledge,
If you don't know that's a trout.

And, likewise, the Harporhynchus,
Which is singing in the bush,
While his mate is incubating,
Pouring forth his soul in gush,
That's another patronymic
For our brown or native thrush.

Hence I only meant to tell you
In the plainest sort of terms,
That this is spring and thrushes sing
'Mid nature's budding germs,
And boyish thought turns toward trout
And agile angle worms.

Many people do not distinguish between poetry and

verse, but there is a great difference which was expressed by the man who objected to having Shakespeare classed with the poets, because, said he: "His plays don't rhyme." Now, I never wrote a bit of poetry in my life, but have written lots of rhymes, mainly travesty, burlesque, parody and that sort of thing which is easy, because it needs little originality. Let me show how this is done:

The Fish and the Ring.

In Rawlinson's translation of Herodotus, the following story is told: "Amasis, King of Egypt, sent Polycrates, of Samos, a friendly letter, expressing a fear for the continuance of his singular prosperity, and, therefore, advising Polycrates to throw away some favorite gem in such a way that he might never see it again, as a kind of charm against misfortune. Polycrates, therefore, took a valuable signet-ring—an emerald set in gold—and sailing away from the shore in a boat, threw the gem, in the sight of all on board, into the deep. This done he returned home and gave vent to his sorrow. Now it happened that five or six days afterwards a fisherman caught a fish so large and beautiful that he thought it well deserved to be made a present to the King. So he took it with him to the gate of the palace and said that he wanted to see Polycrates, and Polycrates allowed him to come in, and the fisherman gave him the fish with these words following: 'Sir King, when I took this prize I thought I would not carry it to market, though I am a poor man who live by my trade. I said to myself, it is worthy of Polycrates and his greatness, and so I brought it here to give it you.' This speech pleased the King, who thus spoke in reply: 'Thou didst well, friend, and I am doubly indebted, both for the gift and for the speech. Come now and sup with me.' So the fisherman went home, esteeming it a great honor that he had been asked to sup with the King. Meanwhile the servants, on cutting open the fish found the signet of their master in its belly. No sooner did they see it than they seized upon it and, hastening to Polycrates with great joy, restored it to him and told him in what way it had been found. The King, who saw something providential in the matter, forthwith wrote a letter to Amasis, telling him all that had happened. Amasis felt certain that Polycrates would end ill, as he prospered in everything, even finding what he had thrown away. So he sent a herald to Samos, and dissolved the contract of friendship. This he did that, when the great and heavy misfortune came, he might escape the grief he would have felt if the sufferer had been his loved friend."

There is a yarn that is very tempting to one who does not take it as seriously as Amasis did, and so I wrote:

The Trout and the Ring.

The tale I sing is a song of spring,
And is true beyond a doubt;
The players are Miss Clara Carr,
Myself, Uncle Jess and a trout.

'Twas Clara's wish to take a fish
From the bridge across the brook;
So I rigged her a line, both strong and fine,
And baited her Limerick hook.

With a spring and a snap a speckled old chap
Snatched the bait and made the line sing.
I gave a shout at the sight of the trout,
And Clara dropped her ring.

We searched for days, in many ways;
We raked and dragged and sounded;
We sifted ooze, but 'twas no use,
In short, we never found it.

Many a trout was taken out
Of the pool where the stream was crossed,
And opened with care, but no ring was there,
And we gave it up for lost.

'Twas a year, I guess, when Uncle Jess
Caught a big trout on a fly;
It was plump and round, and weighed a pound,
And he brought it home to fry.

His eye shone bright as he told, that night,
Of the ring lost a year ago;
On the very spot where his trout was got,
And never found, high nor low.

"Now, what do you think?" asked he with a wink;
'I'll bet you never could guess
What was in that trout," "The ring!" they shout!
"Nothin' but innards," said Jess.

The story of Polycrates, which passed current in the centuries ago could not inspire a modern rhymester to go beyond a bit of burlesque, because the prose part of it has been overworked in many absurd yarns.

Concerning Lent.

Somehow it seems unfortunate for those who live in such northern latitudes as New York, that the lent season should come at a time when fish are scarce, and consequently high. Now that lent is over the fishing season opens, and the markets will teem with fish in a few days. But speaking of lent and fast days, reminds me of a story told me by the late Daniel Fitzhugh, one of the "men I have fished with," but not in the first series, who told to Father Scotius and me, this: "There was an Irish servant at a Cardinal's table in Dublin on a fast day, and there were seventeen courses of fish, 'Bedad,' said the waiter, 'if that's what ye call fastin' it's meself that would stand lent all the year round.'"

As soon as lent has passed the shad begin to arrive in the Hudson, although they have been coming from southern rivers since January, but shad at one and two dollars each are not popular. Then come the mackerel, and by the first of May fish are plenty and cheap in New York markets. Even the nutritious codfish is more costly in lent than at any other season, partly because of the increased demand and partly on account of the severe March storms, which often prevent fishing.

Brook Trout.

To those who wish to know what the prospects for trouting may be on certain streams there is but one answer. Only men who live near a particular stream can

give anything like a guess about the coming season; they see the stream day by day and can hit the answer about right if they note the frequency of rises for the early spring insects, for some of the stone flies and midges hatch from midwinter until May, and are often seen on the snow in cold days. But let two visitors see the stream on different days and one may report the trout as plentiful while the other did not see a rise. Some one has said: "It is never safe to prophesy unless you know."

The market for brook trout in New York City is a short one for large sales, although some are sold all through the open season. Many persons confine their orders to the first fortnight of the season, for no city in the world has such a wealth of excellent fish as New York. Salmon from the Provinces and the west coast; red-snapper, pompano and the best fishes from the Gulf of Mexico, as well as the coast and river fishes near home. Shad soon rival the trout and they are hardly within reach of moderate purses before the mackerel come and drop shad prices, and so it goes through the range of sheepshead, bluefish, Spanish mackerel and an embarrassment of riches.

Yet I estimate that New York City takes 50 tons of brook trout in a season at retail prices of 25 cents per lb. for wild Canadian to 75 cents for Long Islands, and \$1.00 for trout sold alive from the tanks.

Here is another chip on my shoulder, and in a previous article I have intimated a liking for kicking up a row and leaving other fellows to fight it out. Throwing off my coat, stripping to the buff with only shoes and trousers, I put up my "dukes" and say: It has been the fashion for half a century to decry "liver-fed trout" as inferior. I deny the allegation in the teeth of the allegator. Witness the paragraph above. See the prices paid for Long Island trout, which are mainly from private ponds and are mostly "liver-fed," and what the slim, black Canadian wild trout bring. The New York epicure will pay the price for the fat pond-fed trout because he knows that they are best.

Now I "ahsk" you, in all seriousness, if a bit of calf's liver and bacon is not a dainty breakfast dish for a man, occasionally? If so, why should it not be good food for a trout, as good as any fish diet, which trout of over two ounces relish, or, as good as grubs and insects? Of course, we prefer the liver of the calf to that of the cow, and require a bit of bacon to flavor it because we are given to flavoring our foods, but I once broiled a ruffed grouse over coals and ate it without even salt, and it was good, because I was hungry. The trout needs no fried bacon with its liver, but it thrives without that epicurean adjunct. On the slabs in Fulton Market one may pick out the Long Island trout by their aldermanic bellies and amber-colored sides, and these are the fish that bring the prices. Of course, other pond-fed trout from Massachusetts and Rhode Island may be labeled "Long Island trout," but that does not affect the question. In New York market all small clams are "little necks," small oysters are "blue points," large oysters are "saddle rocks," and all asparagus is labeled "Oyster Bay."

I will confess that my estimate of the tons of brook trout sent to New York City is a mere guess based upon the statement of one breeder that he sent six tons of trout to that market in one year, and, no matter if the great demand for this fish is over in a few weeks, every high-class hotel, cafe or restaurant must keep them on their bill of fare, in season.

If fifty tons seems a large amount for one big city, let me say that the city named is a great distributing point. A large dealer gets contracts to supply steamship lines and summer hotels. Say he has a contract with the great Saratoga hotels to furnish a certain number of pounds of trout and other fish each week during their respective seasons. The hotel man has his contract, and when some local fisherman offers him some pounds of trout he has no use for them. The trout are then shipped to New York to the dealer who may possibly send them back to some Saratoga hotel. The hotel man cannot depend on getting a definite number of pounds of trout from local fishermen and consequently does not care to deal with them. A country merchant can buy axes cheaper in New York City than he can in Cohoes where they are made, because his freights will be more from the small town.

On Long Island.

Year by year there is less fishing for the public on this island which once had more trout streams flowing from it than any territory of equal size that I ever knew. The Borough of Brooklyn, now part of New York City, has extended its system of water-works along the south shore of the island and has turned the trout streams into reservoirs which get warm in summer and therefore have no trout in them. One exception is Massapequa Lake, which still has trout, although a city reservoir. Here one must get a permit to fish, if he can, and permits are so freely given that the lake is overfished after the first week. A dozen years ago, when it was the private property of Mr. William Floyd-Jones, there was good trouting there, if one had an invitation from its generous owner.

South side streams, which have not been taken by the city, have mostly been posted, and in some of them an angler can purchase the privilege of fishing, but the streams on the western half of the island are not as plenty as before the water-works invasion. At Yaphank there is a fair trout stream called by two names, the "Conetquot" and "Carman's" River.

On the north side there is Mill Creek, flowing into Oyster Bay, near Locust Valley, where some trout are taken, and from there to Smithtown, where the Nissequogue River flows into the Sound, there is no trouting to speak of. On the Nissequogue the fishing is from boats, and some good trout are always taken there early in the season, but by the middle of May but few are to be had.

Other Parts of New York.

It is not worth while to go to the Adirondacks until the ice is off the lakes, which is usually from the first to the middle of May. There are good streams in all the counties north of the New York Central Railroad to Monroe County, in the Catskills, and west of the Hudson River counties, between Albany and Rockland counties,

including Otsego, Delaware and Sullivan, which are back from the river. In the western part of the State there are many good trout streams along the southern tier of counties where streams head, which flow north into Lake Ontario and others that flow south into Pennsylvania.

New Jersey.

There are a few good trout streams in this State, in the northern part, above Mercer and Middlesex counties, but most of them are posted. Men who know of the best streams in this State, or hint that they do, are chary of giving information about them. Years ago I took some trout in Sussex County, in company with that thorough sportsman, the late Theodore Morford, of Newton, but that was long ago, and it is reported that the streams that we fished are not so prolific of trout as then.

Pennsylvania.

Even the wonderful Pine Creek does not yield the trout that it did in the Nessmukian era, when his "Dah-whoop!" echoed among the pines and the old woodcraftsman cut an alder and murdered trout by enticing them with salt pork, a trout's eye or fin, or whatever came handy, for while he was full of poetry it was not of the kind that stirs the heart of the fly-fisher. I used to give him lectures on this subject, but they never got beyond the whiskers on his ears. Still Pine Creek is a fair trout stream to-day, as Eastern trout streams go; it rises back of Wellsboro, Tioga County, flows through a sparsely settled country and drops into the west branch of the Susquehanna River, near Williamsport, in Lycoming county.

Most of the streams in the east, above Easton, are excellent for trout, whether flowing east into the Delaware or into the east branch of the Susquehanna, and back of Stroudsburg, near the Delaware Water Gap. I have had excellent trouting; see sketch of Hon. James Geddes, *FOREST AND STREAM*, Oct. 30, 1897.

All down those parallel ranges of mountains, east and west of the Alleghenys, there are good trout streams which extend into West Virginia and Maryland.

In the South.

There are some good trout streams along the Blue Ridge, in Frederick county, Md., down along this range through Virginia, West Virginia, North Carolina, Tennessee, and even to the streams in Northeast Georgia, which form the head of the Chattahoochee River. This is the southern limit of *S. fontinalis* on this continent.

The rivers of the Southern States are very prolific of pike, bass, perch, crappie and other good fish, their warmer waters producing fish food in great quantities. To balance this Nature gave to those rivers great gars, and "grindles" or "dogfish," *Ania*, to keep down the surplus. As man now attends to this business there is no longer any use for the uneatable gars and their fellows and they should be exterminated.

Few of the Southern States have Fish Commissions or pay any attention to the fishes as sources of food. Florida has awakened to her needs and has appointed two Fish Commissioners, both of whom are well-known men of acknowledged ability and would be efficient if the State would give them the means to do something, but up to date they have not an appropriation and are paying their own postage. Florida has seen its green turtle disappearing, its fisheries, which once were a great source of revenue, diminishing for want of propagation and protection, and has so far awakened from its lethargy as to authorize the appointment of Fish Commissioners without money to investigate the needs of the State. Thirty years ago, when fish culture was an experiment, Legislatures proceeded with caution and made small appropriations. That day is gone by and Florida should place \$10,000 in the hands of its Fish Commission to enable it to examine its waters, both fluvial and marine, and decide what should be done to benefit the people. The outlay would not come back this year, nor next, but it would be a most excellent investment.

It is singular how tardy the South has been in the matter of fishculture. The rivers which once supplied a profusion of shad for home consumption are now being netted for the last shad to the great Northern markets. Will they wait until the fish are so nearly extinct that the rivers will not furnish enough breeding fish?

The past quarter of a century has seen a revolution in quick transportation which has enabled Southern waters to supply the great markets of the North. This exchanges fish for cash, but when the fish are gone that ends the exchange.

Southern people are apathetic on this question, because fish food has always been plenty, but they have seen the buffalo and the wild-pigeon go before the rapacity of man until the races are practically extinct. The green turtle is threatened with extinction in Florida because the beach-combers, and others hunt their eggs for food. This should be stopped at once.

The idea that fish culture is merely an adjunct to the sportsman should be combatted everywhere. Of course, when fishes which the angler seeks are made plentiful he is entitled to take his share, but the main thing is to increase all valuable fish and to destroy others, since we have upset Nature's balance by killing only such species as we consume; and protection should go hand in hand with propagation.

I have fished in many parts of the South, and have seen the net fishermen throw back useless fish to live and devour better ones. They need to be instructed in this matter, but, lest I be accused of saying that only Southern fishermen need this lesson, I will refer to *FOREST AND STREAM* of Jan. 7, 1899, page 13, where I say the same thing of men in South Bay, N. Y., fishermen who threw seventy-one dogfish, the salt-water cousin of the shark, overboard because it was too much trouble to even knock them on the head. All net fishermen need to be educated in matters that are of vital interest to themselves. They never look beyond the results of the day or the season. As a class the fresh-water market fishermen are ignorant of everything which concerns their business except where to get fish to-day and where to sell them at the best price. Their motto seems to be: "Eat, drink and be merry, for to-morrow ye die." They think that the supply of fish is inexhaustible

and have no idea that each fish has come from an egg and passed through daily perils for years before it met its fate at their hands.

While Northern sportsmen go South in great numbers to catch the worthless tarpon of Florida and to take the black bass and other fishes, they also go North to the salmon rivers of Canada and New Brunswick. Very few Southern anglers go North for sport. Most men like to go away from home for sport with rod and gun. A funny instance of this once happened. I was living on Long Island, and had an invitation from a friend to spend a week at his home in Warren county, N. Y., and shoot ruffed grouse, squirrels and rabbits. I did so and three years later a man with a gun on Long Island asked me where he could find some good grouse, squirrel and rabbit shooting, and, in the talk we had it developed the fact that he came from Warren county to look for good shooting! I could tell him nothing, for I had never looked for game about home, although some rabbits bred in my garden each year, and a few gray squirrels scolded me once in a while when I intruded on their domain, but I never thought of using a gun on Long Island.

None of this relates to fishin' time, but you know how talk on any subject runs. A few of us start in to discuss the proper flies, dressed on the regulation hooks for certain waters and then some fellow remarks that "Peter went a-fishin'," and that if we had been fortunate enough to have been there at that time we might have been among the chosen ones, and then some other fellow asks: "What became of St. Paul?" The merchant from Minnesota moves his ears forward at the name and says: "There's mighty good pickerel in the lakes back of St. Paul, and if you boys will come up there next season we'll have a good time; I'll see to the bait."

"Now, speakin' o' bait," said a traveler, "there's no bait for a dawg like a badger an' it takes an all-fire good un to pull one out of his bar'l, 'less he hooks him right."

"Speaking of hooking," said a man with a bundle of trout and bass rods, "I like small hooks and a little hook will —" Here I have to leave the car and lost the rest of it but it shows how a stray thought will lead one from the main trail.

But fishin' time has come, and this week I hope to take a few Long Island trout and legally eat them in that part of New York City which is on Long Island and is officially known as the Borough of Brooklyn, while those who live across the East River must sneak their Long Island catches to their homes and eat them in fear of game wardens until April 16. Verily our law-makers sometimes do queer things.

Fishing and other Philosophy.

CHARLESTOWN, N. H., March 31.—*Editor Forest and Stream:* I enclose you, for "The Game Laws in Brief," copies of the various acts passed by our last Legislature, some of them are good, some superfluous, and one, in part, decidedly objectionable. I refer to the one which opens the lower half of the State to trout fishing on April 1. The part of it, which closes the season, in the brooks of the same section, on Aug. 1, instead of Sept. 1, is all right, for the brooks in this section are nearly dried up by that date; but three months' stream fishing is enough for anybody, and to-day every stream is frozen up solid, and the snow in the woods is 3 ft. deep. Last year the boys who went out at daylight on May 1 got a few half-starved, hungry trout, but I did not hear of another one for a fortnight, and the only success I had myself was on May 14, when after a warm rain, which raised the brooks, I got a dozen nice ones, of which I wrote you at the time. This new law was got through before I knew of it, by a lot of impatient "sooners" down at Nashua, and other towns on the south line of the State, where there is a warm "pocket" covering a dozen or twenty towns in the lower Merrimac Valley. It gives them a chance about one year in four, to "go a-fishin'," as soon as their Massachusetts neighbors, but the date for opening, of April 1, is too early for any part of Massachusetts, except the tidal streams on Cape Cod. It simply opens the streams in the Connecticut Valley to the Vermont anglers, a month earlier than they can fish in their own State, and though, as I said, there is only about one year in four when they can take advantage of it, it throws us out of line with our sister States in the same latitude, Maine and Vermont, to fit the caprices of a few hungry men on the Massachusetts. It is the third time in twenty years, that those men have played the same game, and twice, the common sense of the experienced anglers of the State has put the opening day back to May 1 again and that is two weeks too early in average seasons, and I speak from sixty years' experience, from Canada to Massachusetts.

I have been greatly amused by the "weather prophets" this winter, especially with those who go by the "goose bone." About a month ago I read the account of a man down in Tennessee, who, it was said, predicted a hard winter, because he had killed eighteen geese, and their breast bones were all perfectly transparent, which was a sure sign. Last week I saw an extract from a prophecy in the New York Sun of last October, quoting a man who had killed a goose whose breast bone was entirely white, and not transparent at all, and this was also a "sure sign of a hard winter." "Who shall decide when doctors disagree?" It is wonderful how people of average common sense cling to these old superstitions. In all my long life among the woods and waters, I never saw any difference in the muskrat houses, and the thick corn husks are simply the result of a warm, wet summer, and no evidence toward the coming winter, whose weather matters nothing to an ear of Indian corn, which cannot be frozen, and is only affected by temperature when put in a "popper."

I do not wish to interfere in any of Fred Mather's discussions, which he says, he starts for the fun of standing back and seeing some other fellow do the "scrapping," but I was struck by the way in which Mr. Wade "got off the track" in his letter a short time since, in which he said that "the alligator took no care of its young, and therefore could not transmit the fear of man to the progeny," or words to that effect. Education of the young was not the question under discussion, it was the trans-

mission by inheritance of the results of experience of the parents, and the claim was, that there was such transmission "ab ovo," in generation and conception, it is an important factor in evolution, and agrees with the Biblical maxim that "the sins of the fathers shall be transmitted to the children, even unto the third and fourth generation," and this, I look upon to mean inheritance.

It sometimes skips a generation entirely, to return in full force later. My mother had great artistic taste and talent, my brother and sisters all inherited it, but I was left out in the cold! My children all draw and paint, and my oldest granddaughter gives promise of becoming a decided and successful artist.

In judging humanity, we do not make half enough allowance, good or bad, for the unavoidable and irresistible qualities which are simply the result of inheritance.

VON W.

Boston Anglers.

Boston, April 1.—To-day marks the legal opening of the trout season in Massachusetts, but the weather is cold and the season unusually late. Only two days ago there was a sharp freeze, and the slow running streams were all closed with ice. Indeed the ground is still covered with snow in the western and northern part of the State. Yesterday morning there was an inch of new snow in Boston, which barely went off that day. Such weather is not favorable to whipping the streams, and fewer persons than usual have made the attempt to-day. Mr. Robinson has gone down to his Falmouth brook, but he will stay till better weather before trying the trout. The fishermen at Essex, Byfield and other points along the north shore will not attempt to lure the trout till the weather is better. Two or three gentlemen interested in trout preserves in Connecticut told me yesterday that their rigging is all ready, but that they should not think of going after trout till the weather is better. I have heard the opinion expressed several times, within a couple of days, that the trout season opens too early in this State. In the markets there was to be found the usual showing of trout this morning; from the trout hatcheries.

April 3.—In spite of a very cold day, with a biting wind and the ground frozen in the morning, there were more enthusiasts who went after trout April 1 than might have been expected. Several members of the Monument Club started by first train for its trout waters at Bourne. The Tihonet Club was also represented on its brooks at Wareham. A number of gentlemen started for private brooks in Falmouth. Others will wait for warmer days and less ice in the brooks. Grover Cleveland and A. H. Wood are fitting out their rigging and will try their preserves in the vicinity of Buzzard's Bay early this week, if the weather is warm enough. It will be noted that the season is most remarkably late, compared with a year ago. The ice left Sebago Lake, in Maine, April 6th last year, but reports from that point on Saturday say that the ice is doubtless as thick as at any time this winter, with a great body of snow on it. Landlocked salmon fishing began there last year by the 8th, and good catches were made on the 9th and 10th. Boston members of the Sebago Club say that they shall be more pleased than they expect to be, if the ice is out of Sebago on the 19th, which is a legal holiday in this State, and a time when they always try to be in camp. Billy Soule, of the Pleasant Island Camps, Cupsuptic Lake, Me., was in Boston the other day. He says that the snow is very deep in the woods in the whole Rangeley region, with the ice 20 in. thick on the lakes and at least 3 ft. of snow over it. However, he thinks that this snow may "rot away" the ice, and under favorable weather in April the Rangeleys will clear anywhere from the 10th to the 15th of May. Prospects of early fishing in Maine are not good this year.

Three beautiful trout in Dame, Stoddard & Kendall's window, early Saturday morning, were the first harbingers of spring fishing. One of them is being frozen into the middle of a solid block of ice, to be on exhibition this week. Some of the fishermen are inclined to believe that this has been done to represent their condition after fishing on Saturday in the cold wind, but the exhibition is labeled: "How trout winter." SPECIAL.

Identity of Common and Labrador Whitefish.

THE common whitefish of the Great Lakes was first very imperfectly described by Dr. Samuel L. Mitchell, in the American Monthly Magazine and Critical Review for March, 1818. The description, in fact, is so unsatisfactory that his contemporaries and later ichthyologists for more than fifty years supposed it to refer to the cisco, or lake herring, *Argyrosomus arctedi*. A good account of the whitefish was published by Richardson in 1836, under LeSueur's name of *Coregonus albus*, a name published only a few weeks later than that of Mitchell; but, like Mitchell's, unaccompanied by a sufficient description.

In 1836 Richardson established a new species of *Coregonus* upon a dried specimen which he received from Musquaw River, that falls into the Gulf of St. Lawrence near the Mingan Islands, giving it the name *Salmo (Coregonus) labradoricus*. This has been retained in the literature as a distinct species up to the present time, although its close relationship to the common whitefish has sometimes been observed without recorded comment.

Systematic ichthyologists have found it difficult to show clearly the differences between the common whitefish and the Labrador whitefish, as may be seen by referring to the monographs upon the whitefishes by Jordan and Gilbert, Bean and Evermann and Smith. They have been forced to rely, finally, upon a single character, the presence of several rows of teeth on the tongue to distinguish the two forms, and this was supposed to be constant and infallible.

The writer has recently had occasion, while studying the fishes of the State of New York, to examine numerous specimens of the common whitefish from the Great Lakes and interior lakes of New York and of the so-called Labrador whitefish from lakes of New York and New Hampshire and from rivers in New Brunswick and Labrador. As a result of these investigations he is forced to the conclusion that Richardson's species, *Coregonus labradoricus*, is identical with the common whitefish *Coregonus clupeiformis*, there being no characters by which the two can be distinguished. Every individual of

the common whitefish, young and old, was found to have teeth on the tongue and to possess the other characters by which Richardson's species has hitherto been separated.

This conclusion has an important bearing upon fish-cultural operations by the States and the United States, as it will tend to simplify the work of artificial propagation, and, perhaps, extend its scope.—Tarleton H. Bean in Science.

CHICAGO AND THE WEST.

Gum Hunting.

CHICAGO, Ill., April 1.—I was short of a story this week, but happening into the offices of the Chicago Varnish Co. I ran across something which I thought might perhaps give me the story, and also afford the readers of FOREST AND STREAM a little notion of a new kind of hunting. I had often noticed the fine collection of gums in the show-cases of this concern, which collection has been making for the past twenty-five years and is said to be the finest in the world, even much superior to that of the Kensington Museum, of London, but I had always looked at the specimens carelessly, and had never stopped to inquire where this sort of thing came from. To-day I began to pry into the matter more curiously, and soon found myself in a field of natural history which had hitherto been unknown to me at least.

I suppose we have all read about amber, and have heard the stories how flies and other insects are sometimes found preserved in pieces of amber. Here I saw any number of pieces of gums, clear as amber and containing insects sometimes in hundreds or thousands. I saw some giant beetles, as long as one's finger, embalmed in lumps of gum, weighing perhaps a pound or so each, the preserving substance being so clear that all the luster of the beetle's mail was given out as clearly as upon the day when his legs first stuck fast on the side of some big tree in New Zealand 2,000 years ago. For all this "auri gum" is at least 2,000 years of age, and perhaps much older. The lighter gums are perhaps not so old. The Kauri gum is more apt to be dark and smooth, though some of the lighter colored gums are rather higher priced. I saw one piece of Zanzibar copal weighing about 12 lbs. which was thought to be worth fully \$500, so large a piece of that gum being very rare. This sort of gum always has a surface covered with minute dots, or what is called a "goose skin" surface. It is very rare to see a piece of this gum weighing the half of 12 lbs. The largest pieces of gum are of the Kauri, of which blocks as large as 35 lbs. could be seen in this collection. I saw one 50 lb. lump of Kauri gum, cut and polished until it looked like agate or petrified wood. Again, I saw a piece of jet black gum highly polished, which against the light showed blood red. Again, there was a long section showing the grain of a piece of bark, about which the gum had flowed. There was a big fungus-like piece of gum, as clear as water, and some pieces like oyster shell, which I was told came from a part of the Congo country whose deposits are now altogether exhausted.

There are a lot of curious and interesting things connected with the trades and applied arts which are continually passed over by the public because they are out of the ordinary run of life. Thus, perhaps not everybody knows that the common commercial product, varnish, is all made out of gums such as I have been describing, and that all these gums are not taken from the surface of standing trees, as is the spruce gum of the Northern pine woods, but on the contrary must all be dug up from beneath the ground, as though they were minerals and not vegetable products. All these varnish gums are fossil resins, the imperishable residue of forests which have perished and have been swallowed up by the earth. We dig up these immortal spirits of the bygone giant trees, we treat them in certain ways, and then we spread them over our manufactured woods in order that they may be made proof against time.

The general name for these fossil gums is "copal," which is a generic name in Mexico for all sorts of gums. The chief varieties of these resins are amber, "animi" and "kauri." We all know about amber, or think we know about it. It is found in Eastern Germany, along the Baltic Sea, and in some parts of upper Burmah. Usually it is washed out by the waves from the cracks in rocks along the seashore. Men do not hunt for amber as they do for the other gums. You do not hunt for amber, but fish for it, and fish with nets. After heavy storms the amber is washed out of the crevices in the rocks and rolled about in the surf. The fishermen hold their nets against the waves, and thus catch the precious gum. Yet amber is sometimes mined, being found along with lignite in cretaceous blue clay. Sometimes, also, it is found in brown coal deposits attached to bits of bituminous wood. Of course, whether found on the seashore or under ground, amber is only the surviving spirit of the departed pine tree, which may have rotted quite away thousands of years before the bit of gum was found.

The "animi" gum is found in Zanzibar and Madagascar, usually in a red, sandy soil and about 4 ft. under ground. Sometimes it comes also from Demerara, though not in so valuable forms. Thus we may see that these gums come from widely diverse portions of the earth, East and West Africa, New Zealand, and even South America. The latter country has not yet been much worked. The so-called Brazilian gum is of a pale yellow color. Thus far no one has found any copal deposits in North America, I believe. New Zealand is the great gum producing country, but shipments also come from Java and Sumatra. There is a little district about 200 miles across, known as the Sierra Leone district of West Africa, which sends out some valuable gums, and here one ought to qualify the sweeping statement as to the subterranean nature of all copals by saying that there are certain Sierra Leone forests where the gum is collected like our spruce gums, its deposits being sometimes hastened by slashing the bark of the trees. From Sierra Leone also comes the "shot gum," small, round particles, very rare and very expensive. Yet other bits of gums come from this region, known as "pebble copal," right valuable, too. These round little lumps are found in river beds, washed down out of the mountains by the floods. Then there are other African West Coast gums, such as the Congo, Gaboon and Loango copals, though these do not cut much figure in trade, I am told. Not many parts of Asia produce

copals, yet it may be of popular interest to know that some shipments come from Manila, in our new caught Philippine country. These supplies are not native to those islands, but are gathered from the Malay Islands roundabout.

I recollect that at the World's Fair, in the Prussian exhibit, there was shown what was thought to be a fine collection of amber, the specimens all being those which showed imprisoned insects. Yet in the collection to which I have above referred I saw, here in Chicago, many specimens which far surpassed anything in the Prussian exhibit. There was one piece of Bombay "animi," about 15 inches long, which was literally full of insects. There is a certain fascination in studying these strangely perpetuated forms of animal life. Here they were, all sorts of flying and creeping things, fragile and perishable themselves, but kept faultlessly preserved, with even the sheen of wing and the luster of scale untouched, mocking at the mummy-making of most skilled ancient Egypt. It was enough to give one creeps up his back.

This study of the fossil gums has the most interest to me as applied to the far-off country of New Zealand, the home of those splendid savages, the Maoris. This is the country which supplies the bulk of the demand of the gum market, its exports running about \$3,000,000 each year. Auckland being the great shipping point. From this country, I take it, come the black gums, which make the most lasting varnishes. There still stand in these far-off regions forests of the giant conifers known as the Kauri trees. Gum can be taken from these living trees, but this "tree gum" is not used for making varnishes. It needs first to sleep a few centuries under the earth. I saw a piece of Kauri bark which was perhaps more than 4 ft. long, sawed out of the covering of some old tree which was about 8 ft. in diameter and probably at least 1,000 years of age. This piece of bark was all shot full of exuded gum, which made the whole nearly as heavy as lead.

This Kauri wood is something like the California redwood, but it is much harder. It might be used for furniture making were it not for one singular quality, not known, I believe, in any other wood. You may take a plank of Kauri wood, dry it in the sun for years, and season it in a kiln for weeks. It will shrink until apparently it is perfectly seasoned. Now, you saw this plank in two, and each half will at once proceed to shrink at least a quarter of an inch more! Saw each piece in two again, and each remaining new piece will again shrink in the same way. Cut the Kauri, and it will shrink from the cut, and you cannot dry the shrink out of this wood in any way known to man. I imagine this fact is something not generally known.

In the war which man is waging with nature it is hard to predict all the outcomes. Man prevails for a while, until nature calmly swipes a whole people off the face of the earth with one wipe of her hand. As I looked at all these strange and beautiful pieces of singular products from far-off quarters of the world I naturally asked about the extent of the supply. The answer is what might be expected. From year to year the gum districts are worked out, and from year to year the pieces that come into market grow smaller and smaller, and will some day be only chips and flakes and dust. It is no wonder, for these gums have been dug for over 100 years, and we know that centuries ago amber was used in the varnish making of Europe.

But I must not run on about things which may be more interesting to me than to others, nor forget the implied promise to tell how the gum hunters find their gum. In the cases holding the specimens that I saw I noted also, among the boomerangs, spears, wands, etc., from the far-away Maori country, a little hump-backed, long-billed bird, with hairs instead of feathers, looking like a giant woodcock, or perhaps more nearly like a big woodchuck, with a bill a foot or so in length, standing on his hind legs and resting on his nose. This was a "Kiwi" bird, and I think that from him the natives must have taken a lesson. The Kiwi bird runs along the sandy reaches and sticks his long probe down into the sand in search of things to eat. He digs his things desired out from beneath the earth. Near to the Kiwi bird in the case I saw a long, steel probe, arranged with a shovel handle at the top, the blade being perhaps 4 ft. in length, drawn to a point and much worn from contact with the sand and pebbles. Mr. Maori had evidently made himself a Kiwi bill, in order to see what he could find beneath the sand!

In the open bush land of the province of Auckland there are districts of soil altogether barren of any forest growth. This soil is loose enough for probing. Some Kiwi bird of an old Maori once upon a time discovered that under this soil, some 3 or 4 ft., there lay rotted out forests of the giant Kauri pines. Thus it was that the great gum districts became located, one after another. They are exploited to-day as regularly as the goldmines. When the gold-mining is flush the laborers flock to the mines, and when the mines are dull they go back to the gum fields. Once the Maoris mined the gum almost exclusively, but now the whites take a hand. Armed with a sack and his long steel Kiwi probe, the laborer goes slowly over the loose surface which covers the forgotten forest. He thrusts down the slender steel time after time. His trained touch tells him whether he has struck a rock or piece of gum. On and on he goes, tapping and digging, now and then finding lumps or flakes of the Kauri gum washed up into the sand near the surface, and sometimes having to dig the full length of his probe to unearth what he knows is there. Weird and grotesque are some of the shapes which he unearths, and it is no wonder that now and then he adds a touch which makes one into a fish or another into a grotesque squatting god. Now and then he finds a bit of bark run full of the preserving copal, and again he may unearth a lump holding the lizard or the beetle which centuries ago crawled up the giant tree trunk in search of something to eat, and which was itself eaten by the tree, and handed down to us in the slow, grim sport of the ages.

Odd hunting enough must be this search for the buried gum, which comes on man-back to the little outlying stations, and thence ultimately to the seacoasts by horseback, and thence by water and rail to all the civilized portions of the world. There is something of a story in these flakes and lumps of pale, translucent material, a story which runs back to the boomerang days, the times before gunpowder and steam and newspapers, when the

moa and the Kiwi bird made merry together, and the Maori banqueted upon his enemy unmolested by the demands of a higher civilization.

The Taylor System.

I WAS interested to note in a late issue of *FOREST AND STREAM* the comment of Mr. Mather on what he terms the so-called "Taylor system" of fly casting, which he takes not to be a new but an old thing, inasmuch as a friend of his had previously discovered that a rolling cast, with the line making considerable splash on the water, would oftentimes take trout, as against the old theory of delicate casting. In so far as Mr. Mather has discovered that a splashing fly will sometimes take trout, he has hit upon the Taylor idea, but I could not well conceive two more dissimilar methods than those practiced by Mr. Mather's friend, and by Mr. Taylor, as I noted during my fishing with him, Mr. Taylor being evidently one of the men that Mr. Mather has not fished with. The peculiar thing about Mr. Taylor's fishing seemed to me the very short line which he used. Yet I presume that of this line and leader he customarily allowed not more than a foot or so to touch the water, the fly being used in flicking the water as one would cut at a small object with the crack of a whip. It was in its way very delicate casting, and very accurate, and certainly the line did not roll out, but the fly was always the first to strike the water, being at once removed for the next series of sharp but accurate flickings, always delivered very close to the same spot, which was supposed to be in front of the hiding place of a trout. I once fished a deep bend just ahead of Mr. Taylor, and as he came up I could see his fly cutting the water at the edge of the bank just even with me and about ten feet away. As we stood in these relative positions he took two nice trout, which came from somewhere or other and struck his fly in plain sight of where I was standing in the water but a few feet away. I should think Mr. Taylor rarely used more than 20 or 25 ft. of line, and often very much less than that. Yet he was mighty quiet in a stream, avoiding the grating of stones beneath his feet, and being especially careful not to break up the surface of the water into ripples by his wading. I have always taken much interest in this method of fishing, for which credit certainly must be given to Mr. Taylor for independent and I think original discovery. In all these comments regarding a somewhat similar fishing I have seen nothing which indicates to me that other persons have habitually fished in the same way that Mr. Taylor does. His method is so unique and so distinct a departure from the old ideas that it has fully deserved all the attention it has received.

In this connection it may be of interest to state that Mr. J. O. Averill's very interesting article on Japanese fly casting has received reprint in the columns of the *Fishing Gazette* of London. It would seem that the doctrine of short and heavy as against long and light is actually traveling around the world, even to the home of Izaak Walton, who, father of angling as he was, seems to have overlooked this very heretical but very practical way of taking trout.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

Oneida Lake Fish Pirates.

THE time of year for free newspaper advertising for the game protectors, who are supposed to look after illegal fishing in Oneida Lake, is at hand. From now until next winter we may expect startling accounts, now and then, about how the protectors have "bravely" captured nets and made big bonfires. A Syracuse paper Wednesday published a story under scare headlines relating that Protectors Hawn and Warren had dragged sixteen trap nets from Chittenango Creek and the open waters at Brewerton. The protectors may be depended upon to get full credit in most of the newspapers for every fish net bonfire they kindle.

And while the protectors are making a big fuss over the burning of a few nets, the fish pirates are smiling, putting out new nets and shipping fish as though nothing had happened. If there had never been a game protector, it is doubtful if the Oneida Lake would prosper more than it does. Many fishermen along the lake shore pay more attention to teaching their children to make nets than they do to giving the youngsters a school education. But if a few pirates were prosecuted to the full extent of the law perhaps others of their kind would not exhibit so much friskiness. A few protectors of the William H. Lindley type are needed.—Canastota Bee.

The New York Striped Bass Season.

Editor Forest and Stream:

In your edition of March 25, Fred Mather seems to think that I wish to have a close season for striped bass, which would prevent angling, whereas I do not care to prevent angling at any season of the year. The wholesale slaughter of bass is caused by seines and other nets in the summer season.

The close season of the proposed law now before the Assembly at Albany is from Jan. 1 to May 1, which covers part of the shad season, and as striped bass are often caught in shad nets, shad fishermen would violate the law by taking from their nets the small number of bass found therein, but after May 1 the seine fishermen would take bass in great quantities and break up the schools, leaving but few for the anglers.

From observation during the past thirty years, I know that seine fishermen are at work at Croton Point and Haverstraw Bay, from May to November, breaking up schools of bass and weakfish and leaving thousands of small fish, including bass, upon the beach.

What is true in this locality must be the case elsewhere. In framing a law for a close season on bass, use a little common sense, upon which all laws are supposed to be founded.

CAPT. A. B. LENT.

Bangor Salmon Pool.

A special from Bangor, Me., Saturday night, says the open season on salmon in the Penobscot begins April 1, but the river is still full of ice, and it is not likely that any fish will be taken in the Bangor Pool for several weeks. Last year the first salmon was taken there on Friday, April 1, by George Willey, of Veazie, and weighed 18 lbs. This was unusually early.

Some Reasoning Dogs.

BOSTON, March 18.—*Editor Forest and Stream:* I have read with great interest the articles which have recently appeared in "our" paper on the subject of animal instinct, or reason, and I submit, for what it is worth, a personal experience which I consider as bearing upon this subject. I have observed several instances of, to me, a similar evidence of reasoning in dogs. I thought this was on a somewhat different line from much that has been printed, but I could cite other cases quite as remarkable.

While living in Worcester several years ago I owned a young English setter, Phil, a dog of more than ordinary intelligence. At the same time I had in my employ a man whose daily duties took him to different parts of the city, and Phil was frequently allowed to accompany him for the exercise it gave him. On one of their trips the man entered a Mechanic street saloon, and while he was busy with his "refreshments" Phil trotted around behind the bar, where a large tabby cat was watching over her litter of kittens. She "lit" on the dog's back and rode him out on to the street, and half way up the block. After his back had healed up and haired out he was as pleased as ever to accompany the man about the city, but he could never afterward induce Phil to enter Mechanic street. I tried it once myself. Although he was too well trained to break from a command to heel, his fear was so overwhelming that I turned back rather than prolong such acute mental suffering as he plainly manifested.

Starting out one day in company with a friend, to do an errand at some distance from the office, I called to Phil to accompany us. As our course took us across the end of Mechanic street, I mentioned Phil's aversion to this street and asked the gentleman to observe the dog's actions when he came to that street. As we approached the corner we both glanced at him occasionally. He was trotting along at heel, but showed signs of nervousness. When about half way across the street I looked around for him, but he was not in sight. Neither of us had noticed when he left us; nor could we see him in any direction. There were very few people on the street at the time, and the only object which it seemed possible he could have dodged behind was a passing horse car. I stepped out into the street, where I could see along the further side of the car, but could see nothing of Phil. We looked in all of the doorways in the vicinity, but could find no trace of him. There did not seem to be any shelter he could possibly reach in the very few seconds we took our eyes from him; but he had disappeared completely, and we returned to the office to wait until he should show up.

At the office we found my wife and the missing dog. Her story was as follows: She was coming down-town on an open car, and as it passed Mechanic street she was startled by a dog suddenly landing at her feet. She recognized him quickly and thought that I had seen her on the car and had jumped aboard with the dog. The car did not make a stop at Mechanic street, but was moving slowly. As she failed to find me on the car, however, she got off at the next stop and came to the office to leave the dog and learn, if possible, how and why he had come to her.

The facts in the case are: The dog had the most intense fear of a certain locality; had not sufficient courage to venture there, even in company with his master; and yet he dare not break away against his command. Suddenly he scented Mrs. M., and whether he figured it out that she would protect him, or that going to her would serve as some sort of an excuse for leaving me, I shall not attempt to say. Whatever he thought, he thought, and acted on it mighty quickly.

We noted that the wind was blowing toward the side of the street we were on and so established beyond doubt the fact that he had "winded" Mrs. M. on the passing car. Therefore it does not seem unreasonable to conclude that this was the influence which determined his decision, worked upon, as he was, by two strong emotions—fear and a sense of duty.

The gentleman with me, who is as familiar with these facts as I am myself, is an old hunter and dog lover. Mr. O. A. Benoit, of Worcester, and I have no doubt he would corroborate my story in all its details.

It seems to me that the mental process shown here indicates something more than mere instinct.

C. HARRY MORSE.

Editor Forest and Stream:

Mr. Fred Mather is always entertaining and instructive whatever he writes about; and never more so than in his article on "Reason and Instinct," with its numerous citations and illustrations in support of his belief and assertion that some of the lower animals possess and exercise the faculty of reason.

Heredity is a subject which has so many side avenues that it is hardly safe to dogmatize about it; but as a comment on the sentence (vide, p. 304), "Plainly heredity must be very, very hard on trigger indeed, when we cannot bring it into play even by mutilating the bodies of ancestors and keeping it up for a hundred generations," I would merely state that there is a well-authenticated case of a man who, having had one of his fingers amputated, became the father of one child, and I think of two or three children born with the corresponding finger either wholly absent, or partially developed. It has been the fashion for many years to shorten the tails of fox terriers and it is now not very uncommon for them to be whelped with tails of the regulation brevity. I do not know, but I doubt, whether the breed of polled cattle was always a hornless breed. Certainly the screw-tail bull dog and Boston terrier were not always thus.

I am, however, more particularly interested in this dis-

cussion about reason in some of the lower animals. On that I take the affirmative side most decidedly. Worcester's definition of reason is: "That faculty in man, of which either the exclusive, or the far higher, enjoyment distinguishes him from the rest of the animal creation." His definition of instinct is: "A natural impulse in animals by which they are directed to do what is necessary to the continuation of the individual and of the species, independent of instruction and experience." The definition of reason admits its existence in other animals besides man, but in a lower degree than it is enjoyed by man; and it also suggests a kind of reason which may be enjoyed by man exclusively.

May it not be that some of us are looking at the golden side of the shield and the rest of us at the silver side? Is it not a question of degree—like the difference in value between gold and silver? The reason of the child is not equal to that of the adult. Possibly, if dogs lived to the age of three score years and ten, they might develop reasoning powers in a far higher degree to what is easily shown they now possess. Heredity would come in as an auxiliary to perpetuate and increase what former generations had acquired. Of course, to this some one may object that the elephant, the eagle, and perhaps other animals do now live to an age as great as, or even greater than, man. These animals are not, however, like the dog and horse, the constant companions of man. A child, fostered by a wild animal, and spending his life with them, would not even know how to talk in his native tongue, although possessed of the proper vocal organs.

I would claim, with Mr. Mather, and not with him alone, but with thousands of others who have made the dog and the horse their companions, that they possess what is called reason—and exercise it frequently in an unmistakable manner. The influence of association is perhaps greater than any other influence, both morally and mentally. It is especially so with children. The Moravians, who excelled as educators, had a saying that if they could have a child until he was seven years old, they did not care who had him afterward.

By reason of their usefulness and faithfulness, the horse and dog have been companions of man from time immemorial. The Arab horse is the most intelligent of all breeds, because he has been for centuries the constant companion of his master and family. Certain breeds of dogs are more intelligent than others for the same reason.

I would like to cite several instances where dogs have shown the faculty of reason. I think it is hardly fair to conclude that because some one has never known a dog to do so simple a thing as to "push the expiring brands on a fire," therefore all dogs are devoid of reason. With all due respect to the writer, I think this is rather begging the question. It is like the man who, having been accused of stealing by another man who saw him steal, offered to prove his innocence by bringing a hundred men who would swear they hadn't seen him do it. For my part, I humbly think it is evidence of good sense, if not of sound reasoning, for a dog not to take fire brands in his mouth under any circumstances. If a dog had hands and could use a pair of tongs, it would be different. Shakespeare says:

"This boy that cannot tell what he would have,
But kneels, and holds up hands for fellowship,
Does reason our petition with more strength
Than thou hast to deny it."

Six years ago, a gentleman sent me from Toronto a dog. In his letter, notifying me of his coming, he wrote that there was probably only one other dog in the world like him, and that was his little brother. He said his grand dam had taken first prize in Vienna as a Great Dane, and his sire was a greyhound. He suggested my calling him a Canada greyhound; but I preferred to call him a Danish staghound. Every member of my family believes that this dog understands nearly everything we say to him. That he tries to talk English, and would do so if his vocal organs were like those of a man, we also fully believe. As it is, I know by his voice when he is barking to be let in, or is barking at a tramp or peddler, or at a cat up a tree, or a squirrel, or is only barking to let us know some friend is approaching the house. I will mention only one instance in which he showed the reasoning faculty. One day, my daughter threw him a very hard and dry crust of bread. He took it into his mouth, hesitated for a moment, and then went to a pail of water at the pump in the yard and dropped it into the pail. He waited for a minute or two, and then took it out and ate it. On being told this, I thought it over for some time, trying to account for his action; until I remembered that in the kitchen there was a pail into which the cook puts greasy water, and frequently pieces of bread.

Leopard was in the habit of foraging in this pail. He knew that the pieces of bread in that pail were soft, and so he reasoned that if bread was softened by water in that pail, it would be softened by the water in the other pail. He acted upon this theory, and found his conclusions were correct. There was no "sympathy" about it nor can you attribute it to instinct, for it was not an impulse by which he was directed to do something necessary to the continuation of himself or his species. Neither was it the result of any training, or of imitation. It was an original act with him.

Leopard has done other things which showed calculation and strategy, as well as good logical reasoning. But I never knew him to put wood on the fire—and in fact I don't know that he ever had any opportunity to do it.

The late Hon. Timothy Jenkins, of Oneida, N. Y., a very prominent lawyer in his day, had a horse called Jim, and this horse sometimes interfered. He also had a green Irishman in his employ named John. One day Mr. Jenkins was returning from circuit and John met him with old Jim. As they were driving from the station, Mr. J. turned to John and asked quite sharply: "Does Jim interfere any now?" John didn't know what the squire meant by interfere, but he knew that he must say something, and so he said "Interfere!" Shure, sor, he's an able-bodied horse, and he can do it if it is required of him, sor." And so I think that Leopard could even put a stick of wood on the fire, if it "was required of him." But because he has never done so is not, I take it, any very smart proof that he has no reason.

Some years ago I bred a fox terrier whose name was Philip, A. R. R., 4229, and whose pedigree was long and unsullied. It would take too much space to tell of the many "reasonable" things he did in his short life; but I

will mention one thing, in which I think instinct and reason acted harmoniously. Possibly some may object to calling that peculiar sense which we call "scent" possessed by dogs and other animals, instinct—but we call it that for lack of a better word. One of my sons had been in the woods, and in climbing a tree had lost his pocketbook containing some money. In the afternoon of the same day my two sons were sitting on the front doorstep, when they saw Philip coming from the woods with something in his mouth. He came to them, passed by the younger one, and dropped the purse at the feet of its owner. Now in this case, instinct, or that faculty of scent peculiar to animals, made Philip know that the purse belonged to his friend, my son. Why didn't he leave it, just as he would leave the scent of his footsteps? Something besides instinct told him that his young master valued this purse. In his poor dumb, doggy, grateful mind, he reasoned out that it was his duty as a faithful, conscientious, well-bred, well-treated dog, to carry this purse to his master. And he did it. And that he knew he had done the proper thing, and was as well pleased as his young master was, let no one doubt! His vocal organs were all imperfect. He could not talk; but he wig-wagged his sentiments just as clearly as Dewey or Schley could signal from ship to shore. Faithful and almost human, old Phil! Under the bed of annual foliage plants the remains of his true and plucky little ego rest. Of his sub-ego I am an agnostic.

Two other fox terriers that I bred, both related to Philip—their mother by Perry Belmont's Bacchanal—were very intelligent; perhaps not more so than their brothers and sisters.

One of them I gave to my daughter, living in New York city. She brought him into the country one summer and he got filled with fleas. When she took him to town she put him into the bath tub and scrubbed him with a brush. Some time afterward she went away and left him with the servants, and he went into the coal cellar and got very dirty. When his mistress returned he expressed great delight, and ran upstairs to the bath room, jumped into the bath tub, took the brush in his mouth and whined; asking her as plainly as language could have expressed it, to wash him as she had done before. Memory and intelligence were certainly shown, and I think, there was also a little bit of what we call reason exhibited. And as "cleanliness is akin to godliness," let us humbly regard the dog as not beneath our esteem. In olden times they ate of "the crumbs which fell from their master's table," and these "crumbs" were pieces of soft bread which served the purpose of napkins, and were not the chance droppings.

The litter sister to this fox terrier is the handsomest fox terrier I ever saw. She belongs to Dr. Rodman, of Huntington, L. I., a brother of the former owner of the famous setter known as Scott Rodman's Dash. He had a bull terrier which he kept on the chain. His wife told him that the fox terrier unbuckled his collar and let him loose. He would not believe it, until one day she called to him and told him to watch the fox terrier. He saw her pull at the strap until she got the end out from the loop, then she pulled on it until she unbuckled it—the bull terrier holding still the while—and when she had got the collar off they started away for a frolic. Now I do not think you can call this instinct. I think there was more ego than sub-ego in it; and if there was not reason, what will you call it?

I could cite many more instances equally as strong, which have come under my own observation, but I will close this communication with one more, which I can vouch for as being authentic.

In 1851-3 I was living at the Hague, in Holland. The chaplain of the English embassy then was the Rev. Mr. Harris. He told me that he was visiting at a gentleman's place in England, and saw a large dog chase a rat under an outbuilding. He could not get into the hole through which the rat went. He started for the house and came back with a cat in his mouth, and put her at the hole. The cat went under the building and caught the rat. The dog was on good terms with the cat.

Now there was exhibited in this very good reason, and also quick action upon this reason. There was no instinct about it. It was downright and upright reason. It was a clear case of *ratiocination*. This dog may not ever have put a fire-brand on an expiring fire to keep himself warm. Possibly he might have kept warm in some other way.

Perhaps he would have accepted a calf's hide stuffed with straw for a real calf—as many a child might do—and not have noticed a color in pups that smelt alike, but you couldn't fool him on the size of a hole, and the comparative size of himself and a cat.

The old saying is: "There's reason in all things," and we beg leave to add, "especially in dogs."

DE CANIBUS.

Charlottesville Field Trial Kennels.

Mr. Edward Dexter, of Boston, Mass., whose name is familiar to all sportsmen who are interested in the affairs of the dog and gun, has sold his famous kennel of pointers and setters to Mr. Hobart Ames, of North Easton, Mass. The kennel will be located at Charlottesville, Va., and North Easton, Mass., and will continue under the old name, which has been conspicuous in field trial annals for so many years. We are informed that Mr. Dexter feels that he is in years where he would prefer to see a younger man carry on his good work on the lines laid down by him with such success through so many years, and he feels content in having found that man in the person of the popular sportsman, Mr. Hobart Ames. The policy of the kennel will be to run the dogs to their utmost in every competition, try to breed the highest type and worker possible, the pointer receiving special attention. Mr. Ames will add his own famous bitches, all field trial winners, to the kennels. They are Christina Guenn and Lady Mildred.

Mr. Dexter's name has been associated for many years with field trial competition where it was hottest—East and West and South. He was neither exultant in victory nor despondent in defeat, though to success he was not at all a stranger. His retirement is distinctly a loss. Mr. Ames has been a field trial patron for many years, and now widens the sphere of his action in the sportsman's world.

Jim.

Edmund Day in Detroit Tribune.

Jest an orn'ry yaller pup,
'Thout no breed nor kin.
Eats a heap o' vittles up,
Yet he's allus thin.
'Taint the sleekest kinder skin.
Hides the kindest heart;
Take a costly dog ter win
Me and Jim apart.

Tell yer what the critter done,
He jest saved my life,
That time old Marm Robinson;
Visited my wife.
She's Sue's mother, don't yer see;
Best she ever had,
But we never could agree,
'Cause I made her mad.

Marm staid with us jest a week,
Seemed an awful spell;
Wife an' me, we didn't speak,
Home was jest like—well
'Tweren't jest as nice a place
As it was before.
Frowns and scowls on ev'ry face,
An' a heap o' jaw.

Then I found this yaller pup,
Comin' home one night;
Picked the orn'ry critter up,
I was kinder tight.
Fetched him home like he is now,
Got marm's dander up,
Made her raise an awful row,
Swore she'd kill the pup.

Jim next day got prowlin' 'round,
While marm took her nap,
An' when she were sleepin' sound,
Ate her Sunday cap.
Chewed her knittin' all ter bits,
Chased her Maltese cat,
Scared the critter inter fits—
Wise young pup, sir, that.

Marm she swore she wouldn't stay
In the house with him,
Packed her duds an' moved next day,
All along of Jim.
An' when I come home that night,
'Spectin' frowns an' strife,
Jim he wore that collar bright—
Put thar bv my wife.

Now you see why we love Jim;
Yes, my wife an' me,
Think a mighty heap o' him,
Saved us both, yer sec.
Marm writes that she'll visit us.
When Jim goes away.
Wife an' me no longer fuss—
Jim, you bet, will stay.

Mr. A. C. Wilmerding's Watnong Wiggley.

Mr. A. Clinton Wilmerding writes: I have just lost my well-known working spaniel Watnong Wiggley (No. 38683) by pneumonia. He was a striking dog in appearance, being beautifully marked, and active and stylish when worked with the gun. There are a host of people who knew him who will feel his loss almost as keenly as I do, as he was such a popular favorite. I killed about 200 birds over him last fall. He was about seven years old at the time of his death.

Canoeing.

A. C. A. Regatta Programme, 1899.

SINCE the annual meeting Com. Thorn has appointed a regatta committee, including Messrs. Al. T. Brown and John W. Ely, of Rochester, and F. B. Huntington, of Milwaukee; also Mr. John S. Wright, of Rochester, as chairman of the camp site committee, and Dr. F. R. Smith, of Rochester, as Fleet Surgeon. The regatta committee has issued the following proposed programme for the meet races, to which the attention of all members is called. Com. Thorn has not yet decided on the camp site, though it will be somewhere in the vicinity of Grindstone Island.

Thousand Islands, Aug. 4 to 18 inclusive, 1899.

Members A. C. A.—Following programme of events for the next annual meet of the American Canoe Association has been prepared by the regatta committee. Criticism and suggestions invited. The committee's shell is good and thick; take a hack at it and have done with it. If any member can suggest anything new in the racing line, we want to "get next" immediately.

Sailing Races—Decked Canoes.

Event No. 1—Record Combined Race—Paddling and sailing, half mile alternately, three miles; time limit, one and one-half hours; start to be made under paddle. Aug. 8, A. M.
Event No. 2—Record Sailing—Four and one-half miles; time limit, two hours; same rig and seat to be used in events Nos. 1 and 2. Aug. 8, P. M.
Event No. 3—Record Paddling—One-half mile straight-away. Same canoe as events Nos. 1 and 2. Aug. 9, A. M.
Event No. 4—Unlimited Sailing—Six miles; time limit, two and one-half hours; see rule 1 of sailing regulations. Contestants in Trophy race will be selected in this event under rule 5 of racing regulations. Aug. 9, A. M.

Event No. 5—Trophy Sailing—Nine miles; time limit, three and one-half hours. See rule 5 of racing regulations. Aug. 10, A. M.

Event No. 6—Dolphin Sailing Trophy—Seven and one-half miles; time limit, three hours. Canoe winning first place in Trophy race will not compete in this event. Aug. 10, A. M.

Event No. 7—Novice Sailing—Three miles; time limit, two and one-half hours. Open only to members who have never contested in any but their own club sailing races. Aug. 10, P. M.

Event No. 8—Sailing, Live Man Overboard—Decked sailing canoes, one-fourth mile. At the discharge of gun, the passenger will go overboard, the canoe will pass around the quarter-mile buoy, pick up his man, and then sail to home buoy.

Sailing Races—Open Canoes.

Event No. 9—Open Canoe Sailing—One and one-half miles; one and one-half hour's time limit. Open or partially decked canoes allowed.

Event No. 10—Combined Sailing and Paddling—One-half mile alternately, one and one-half miles; time limit, one and one-half hours. Start under sail. Single blades. Open or partially decked canoes allowed.

Note—In events 9 and 10 the sail area is limited to 40 square feet. No rudder, or seat projecting beyond gunwales, allowed. One pair detachable leeboards may be used. The paddle can only be used for steering except in event No. 10 on the paddling leg. The same canoe, sail and leeboards will be used in both events. Canoes may have the usual bow and stern decks of about 32ins., and side decks of about 2ins. wide with combing about 1½ins. high. Canvas covers or other substitutes for decks will be measured as decks.

Division Sailing Races.

Event No. 11—Atlantic Division Cup.
Event No. 12—Central Division Cup.
Event No. 13—Northern Division Cup.
Event No. 14—Eastern Division Cup.
Event No. 15—Western Division Cup.
Event No. 16—Northern Division Open Canoe Sailing for Orilla Cup.

Note—Division sailing cup races will be sailed on Aug. 14, weather permitting, provided they have not been sailed at division meets and will be sailed under the rules provided by each division, which will be posted on the bulletin board day of race, and called in the order published. Division regatta committees will run their own sailing races. (See chap. 9.)

A. C. A. War Canoe Championship Race.

Event No. 17—War Canoe Race—A. C. A. championship, one mile straight-away. Aug. 16, 10 A. M.

Division Paddling Races.

Event No. 18—Western Division Gardiner cup paddling; open canoes.

Event No. 19—Northern Division war canoe race; open to A. C. A. members only. Aug. 16, 3 P. M.

Paddling Races.

Event No. 20—Trophy Paddling—One mile straight-away; paddles optional. Aug. 15.

Event No. 21—Tandem Paddling—Single blade, open canoes, half mile with turn.

Event No. 22—Relay Race—Open paddling canoes, single blades; one and one-half miles, over sailing course; three men from each club or division. Starters paddle to and around first buoy, pass an article to second man, who paddles to and around second buoy, passing to third man, who paddles to the finish.

Event No. 23—Paddling—Single blade, half-mile, with turn.

Event No. 24—Novice Paddling—Single blade, open canoes, one-half mile with turn. Open only to members who have never contested in any but their club paddling races.

Event No. 25—Four Men Paddling—Single blades, open canoes, one-half mile with turn.

Event No. 26—Tandem Overboard—Single blades, open canoes, one-fourth mile. At the discharge of the gun both men will jump overboard, clear of their canoes, regain their seats in same, and paddle to home buoy.

Event No. 27—Tail-end Race—Single blade, open canoes, one-eighth mile. Paddlers will kneel in bow of canoe and paddle bow first with the wind.

Event No. 28—Upset Paddling—Single blade, open canoes.

Event No. 29—Hurry-scurry—Single blade, open canoes. Run, jump, swim and paddle.

Event No. 30—Ladies' Paddling—Single blade, open canoes, one-fourth mile with turn.

Event No. 31—Ladies' Tandem Paddling—Single blade, open canoes, one-fourth mile with turn.

Event No. 32—Swimming—One hundred yards.

Event No. 33—Tilting Tournament—Sparring poles will be provided by the regatta committee. Each sparrer will stand immediately aft the forward thwart. Both contestants must be on their feet when giving and taking.

Notes.

First, second and third prizes will be awarded in all events except No. 33. Two starters to win first, three starters to win second, and four starters to win third.

Flag prizes will be awarded sailors and paddlers. First prize flag will be blue ground with event in white letters; second prize same as first, except body will be red; third prize same as the others, except body will be white.

Events Nos. 1, 2, 3, 4, 5, 6, 7, 11, 12, 13, 14, 15 will be called on the dates shown in programme weather permitting. The time for starting same will be posted on bulletin board by 8 A. M., date of race. Postponed events will be run off first opportunity.

Events Nos. 17, 19, 20 will be run on dates shown in programme, wind, sea, or rain notwithstanding.

The committee reserves the right to call remainder of programme at any time during the meet when in their judgment the conditions are most opportune notice of which will be posted on the bulletin board at 8 A. M., date of race.

A special banner, emblematic of the "A. C. A. War Canoe Championship," together with a suitable "follow" prize, donated by Com. Thorn, will be awarded the winning crew of the war canoe event. Flags for second and third places will be awarded also. There is promise of a handsome cup, to be either a perpetual or limited trophy, in addition to the banner for the winning crew, announcement of which will be made later.

Entries must be filed with the clerk of the course one hour previous to calling of any race.

All events will be called promptly at hours designated on bulletin board. Events postponed for lack of starters will not be called the second time. Stragglers will be ruled off the course.

AL. T. BROWN, Rochester, N. Y., Chairman.

JOHN W. ELY, Rochester, N. Y.

F. B. HUNTINGTON, Milwaukee, Wis.

A Few Stray Leaves from the Log of the Frankie.

BY THE 'COMMODORE.'

[Continued from page 256.]

All was bustle and confusion in the morning. The camp was struck, the canoes packed and slid down the sandy bank into the river. A big farm wagon was brought down the lane and backed up to the edge of the bank above the camp, and the heavy wooden skiff, Mac, was carried up and loaded on it.

Prof. Murray having declared that nothing could induce him to continue on the river another mile, he decided to abandon the trip right here, so after the Mac was comfortably disposed of, he and Dunbar, and Baldwin Wayt climbed up into the wagon with the boat, and with cordial good-bys and well-wishes, were driven off down the road four miles to Milnes, from whence they would return home by rail. The Doctor and Lacy also intended to abandon the cruise and return home from Milnes, but decided to accompany us down the river that far; so with farewell greetings to Mr. Coffman and his family, who came down to see us start, we stepped aboard our canoes and were swiftly whirled away on the rapid stream.

We found more ledges, fish dams, rapids and rough water generally crowded into the five miles of river between Coffman's and Milnes than we had experienced in any ten miles above, and when we finally beached our canoes on the rocky shingle in front of Milnes after a steady mile and a half of boiling, foaming downhill rush of waters, plentifully strewn with rocks and ledges, where the big waves tossed us around and washed our decks and drenched our arms and shoulders in a way the like of which we had not before experienced, we were very glad indeed that the Mac party had not attempted the run.

We were at Milnes several hours. While here we received accessions to our supplies from Staunton by express, and I gladly embraced the opportunity to express my sail back to Staunton, as I had found it to be but a useless encumbrance. At the express office we found our quondam companion, the Mac, lying on the platform. It was a matter of much amusement to us at almost every ford, camp or stopping place on the trip, from the very start to Coffman's, wherever anybody gathered to see us, to hear the universal expression of opinion in favor of the Mac, and the universal distrust of the little narrow, frail-looking canoes. Every man who had an opinion to express stated emphatically that he would be everlastingly objugated and otherwise imprecated if he wouldn't "take his chances in that 'ere skiff, and didn't want nothin' to do with them 'ere new-fangled, cranky little punkin seeds of canoes!"

IX.

I was awakened very early in the morning by the vigorous crowing of a big red rooster of undoubted lung power perched on the fence but a few feet from the Frankie's tent, and found it was raining heavily;

OUR CAMP.

so, after housing sufficiently to shy a convenient club at the rooster as a suggestion to him to sound his morning bugle elsewhere, I wrapped myself snugly in my blankets and turned over and went to sleep again, soothed by the musical patter of the rain on the roof and sides of my tent. A late start was the consequence, and it was 10 o'clock before we were again afloat.

We packed the canoes where they lay and carried them down the high, steep bank, with the willing assistance of the curious little knot of rustics gathered around us, and launched them over the side of the ferry boat, stepped aboard and dropped gently down the smooth, still reach below the ferry, down the swift, gravelly rapid below, around the bend, out of sight

of the little hamlet, and along the giant ragged flanks of the Fort Mountain, which rises directly from the water's edge in a grand, imposing, tree-covered slope clear to its lofty summit, a couple of thousand feet above. The river is very crooked in this region, and pursues a zigzag course back and forth across the narrow valley from east to west and from west to east, in search of an outlet through the mountains, for nearly fifty miles.

In a short time we were off Mauk's mill, and passed the dam with not a little difficulty and danger. The dam, after crossing the river in a straight line until quite near the right bank, turns at right angles and runs for quite a distance down stream parallel with the bank until the mill is reached. Right in this angle there was a good-sized break, through which the water rushed in a furious torrent, with a drop of 5 or 6 ft. in a couple of canoe lengths. It was rough beyond description, but we were game to tackle it, as there was plenty of water. I went first in the Frankie, and passed over the dam successfully, but after pitching and tumbling down the steep slope, smashing upon the hidden rocks at the foot of the break so badly that I was in imminent danger of a capsizing. I threw off my apron and threw open my midship hatch, and gathered myself together for a hasty jump overboard to save my canoe and stores from

A SAILING DINGHY.

irretrievable smash, when, with one or two more parting bumps I cleared the rocks. George pluckily followed in the Rosa, undismayed by my hard luck. He crossed the dam a little further to the left, and although he hung up badly on the dam, he escaped the rocks below, and we shot on down the swift rapid below the dam, waving our helmets in response to the congratulatory salutations of the little settlement around the mill, which—men, women and children, including a sprinkling of pretty girls—were scattered along the bank in the dooryards to see us run the dam, and fully expecting to see us get a spill.

The day's cruise was simply a succession of rapids, falls and dams, interspersed with dams, rapids and falls. On the good water we had we took everything that offered, and although we met with no mishaps, we had a rough, wet time of it.

Late in the afternoon, after picking our way through probably the worst and most troublesome series of reefs we had yet encountered, we reached Goode's mill. The fall of the river was so considerable that there was not half a mile of slack water above the dam, although it was an unusually high one. The channel through the reefs above led us close along the left bank, and as I expected, we found a shoot in the dam on this side also. It was such an unusually rough one that we landed to reconnoitre instead of going right through, as we had heretofore done.

The dam was built on a heavy line of reefs, and ran straight across the river from the right bank until within a few yards of the left bank, where it ended, and was joined at right angles by a heavy wall of timbers and rocks, which extended up the river some 30 or 40 yds., parallel with the left bank, when it made another right-angle turn and came in to the bank. The shoot was formed by merely leaving off the top course of timbers on this short wall extending out from the bank. The fall was a perpendicular one of about 4 ft., over which the water slid in a smooth, deep flow, without apron or other attachment to break its force or give it slope. Immediately below the fall the water reared itself up on end in a huge, foam-crested coamer, nearly or quite as high as the fall itself, followed by a long line of lesser coamers down the swift little canal between the wing of the dam and the bank, which ended in a nasty ragged fall about a yard high, over the rough reef on which the dam was built. Below this was 100 yds. of quite rough rapids.

"Well, what do you think of it?" said I, as we gazed in dismay down upon this unpromising looking hole in the river.

"Pretty rough," was George's not very reassuring reply.

"I believe I'd rather walk," said I, as we made our way down through the underbrush and inspected the rough looking little canal, and the angry ragged fall at its foot.

"What's the chances for a portage?"

"Poor. I don't see how we can get the canoes up this high, steep bank, nor how we could get them through this thick underbrush, after we get them up."

"How about the other side of the river?"

"Well, the bank looks clear over there, but the river

is a quarter of a mile wide, the current is so swift through the mill pool we'll have to paddle back up the river that far before we dare venture to cross above the dam, and after we get over there we'll have to carry the canoes around the mill as well as the dam, as it is built right up from the water."

"That's so. I guess we'll have to run the shoot!"

"Well, here goes!" said I, as I stepped into the Frankie; gave an extra touch to the fastenings of the fore and aft hatches, closed the well tightly in front of me, pulled the apron up to my chin and pushed off, while George remained on the bank, to see me go through.

My canoe slid smoothly over the dam and swooped down the steep fall with a dizzying swing. She stuck her sharp nose squarely in the middle of the huge coamer below and drove right through it. The water rolled in a solid sheet clear over the canoe from stern to stern at least a foot deep, and the foaming crest of the wave struck me full in the face, completely drenching my arms and shoulders, which were above the apron, while the water poured in around the aft corners of my apron by the tubful, pretty effectually drenching the rest of my anatomy below the apron. The canoe shivered and trembled with the weight of water on top of her, and I still wonder why her light canvas decks were not crushed in by the load. She finally staggered to the surface and fled, pitching affrighted down the rough canal and plunged headlong over the 3 ft. fall at the bottom, where she hung up so hard and fast on the reefs that I narrowly escaped a capsizing, only escaping by good management and dexterous, vigorous shoves with my paddle, assisted by the boiling torrent around me.

I finally got off into the smoother water below, where, without waiting to run the rapid, I made a landing and scrambled ashore, and hurried along back up the bank in a quiver of excitement to see George make the plunge.

"Now, darn you; let's see you go through!" was my excited exclamation (so George avers; I have no recollection of it myself), and through he went, pretty much as I did.

He made a landing alongside of the Frankie, and as we sat on the bank, dipping the water out of our canoes, we congratulated each other on our successful passage, the while we vowed we would attempt no more such shoots.

The river ran deep and still, though always swift, for miles. The Fort came down out of the clouds in a long, sloping, gracefully undulating, tree-clothed spur, which lost itself in the heavy woods along the river. The Massanutten range came to an end as abruptly as it began; the historic peak, used as a Confederate signal station, standing like a giant sentinel over the broad, reunited valley sweeping smilingly away to the distant Potomac. The railroad returned to the river again, and followed more or less closely along the bank; now directly along the water's edge, as it lay along some narrow little shelf in the side of the cliffs or hills, now taking a short cut through the level fields across some bend, to reappear again further down. The dense forests along the banks gave place to smiling green fields; farmhouses and mansions appeared here and there, and the lovely, peaceful, twilight, pastoral surroundings were the more welcome after the wild solitude of the all-day-long cruise.

Occasional short, steep, gravelly slopes appeared, down which the river rushed boisterously, but deeply and free from obstructions, affording us fine coasting, with nothing to look out for but the big waves, which our canoes rode buoyantly.

A densely packed excursion train thundered by up the road as we were pitching and tossing safely down one of these rifts, and a whirlwind of handkerchiefs whitened the sides of the cars, evidently a tribute of admiration to our daring, which we returned by waving our helmets.

We portaged around the Blakemore dam, although it had an open shoot in it. The dam was a high one, and the shoot consisted of a huge trough of logs, down which the water pitched and roared at an angle of about

RUNNING A DAM.

60 degrees. The floor of the trough did not seem to extend below the water, and the torrent pitched off the end of it like a huge spout, and the enormous wave that reared its foaming, splashing crest high in air at the foot of the spout looked so menacing to small craft that we hadn't the sand to tackle the shoot, and so, very wisely I think, we carried our canoes around.

Twilight had long been stealing its shadowy folds around us, and now darkness began to close in on us, accompanied by a light rain; but still on we pushed as hard as we could drive, regardless of the occasional light rifts, our destination now not far off. We rounded one more bend, and the whitewashed side of the lofty railroad bridge at Riverton gleamed through the fast falling shades of night, and in a few minutes more we were

SAILING DINGHY—DESIGNED BY J. WILTON MORSE, ESQ.

groping around among the gondolas and other craft moored above the mill on the right bank, in search of a landing and camping place, the broken ruined piers of the old bridge, burned during Jackson's historic onslaught on Banks at this place, rising like spectres in the gloom from the deep, still, black waters.

We found no favorable landing on this side, as the bank rose steep and high from the water, and felt our way carefully across the river to the left bank through the darkness, the roar of the river falling over the big old dam but a few yards below sounding startlingly close through the gloom, and stepped ashore at a good landing place where several rowboats were moored just as a small party of young men from the village out for an evening swim reached the spot.

"Hello, boys! How far up you been?" they asked, as we were laboriously pulling the canoes ashore, evidently mistaking us in the darkness for two of their own number.

"As far up as Staunton," George replied. "Will you kindly give us a lift with these canoes up the bank?"

They readily and cordially assisted us, as they discovered their mistake, and carried the canoes for us up on to a nice grassy bank under the spreading branches of the trees, between the roadside and the river, and were greatly interested as we briefly outlined our story. We threw off the hatches and spread our blankets, and put up the tents as hastily as possible to keep the blankets from getting wet by the light rain that was falling with more threatening.

A few sticks were hastily gathered and placed in the camp stove and well saturated with coal oil and lighted; a quick, plentiful supper of bacon and eggs, flanked by bread and butter and steaming hot coffee, prepared and stowed away by the light of my boat lantern, and we crawled into our tents, leaving our supper utensils to care for themselves until morning, and speedily dropped off to sleep, pretty well tired out with our thirty-three miles' battling with reefs, rapids, falls and dams, the rain soothing us with its gentle lullaby on our canvas roofs the whole night long. F. R. WEBB.

Drafting.

Yacht Designing.—XXVII.

BY W. P. STEPHENS.

(Continued from page 240, March, 25).

MANY of the instruments of the draftsman are adaptable to a variety of uses for which they were never intended; for instance, the T square with shifting head is a favorite weapon for broadsword practice among students, the dividers come into play as nut-picks, reamers and awls, and the scales and straight edges serve as guides for a knife in cutting paper. If any such uses are contemplated, only the cheapest instruments should be purchased, to be thrown aside in a short time as worthless for drafting. If good instruments are purchased, they should be used and preserved with the greatest care, as

they are extremely liable to injury and deterioration. Some of the more expensive instruments, such as the long straight edges and the larger triangles, are practically useless after they once become slightly out of truth, with the edges warped or nicked and the angles untrue.

It takes a good deal of time on the part of the draftsman who is working regularly day by day if he has to put every tool away in its own special receptacle at night, and this is seldom done, even where elaborate instrument cases are at hand; the tools are left to lie about from day to day, only being stored in their proper places at long intervals when the work stops for a time. The best plan is to have the drafting room so arranged that everything may be quickly restored to its proper place after using. The weights should have a strong shelf near to the drafting table or in the lower part of it; the battens should be kept in a long box about 2 in. wide and 1 in. deep, with a hinged lid, or there may be separate boxes for long and short battens. The longer straight edges, T squares and curves should hang on the wall, against a piece of baize cloth if the wall is at all damp, and they should always, whether in use or not, be kept out of the sun. It is a great help and comfort in drawing to have a board that is perfectly true and flat, and scales, curves and triangles that lie perfectly flat on it; but all of these instruments, whether of wood, ivory or celluloid, are liable to warp however carefully treated, and are certain to do so if left in the sun. The small curves, of a foot or less in length, are best stowed in a shallow box or drawer, a couple of feet long, 8 in. wide and 2 in. deep; and a similar box will hold all the scales; these being merely laid in loosely and not put into racks.

The most convenient receptacle for the numerous small instruments is a home-made affair, a plain box about 30 in. long, 10 in. wide and 2 in. deep inside measurement, with a hinged lid. This box is fitted with five small drawers or tills, each 10 by 5 by 1 in. outside measurement, made of 1/2 in. wood, these sliding on ledges 1 in. deep along the sides of the large box. One of these tills contains the pencils, one the pens for lettering, one the drafting pens, one the various compasses and dividers, and one is devoted to miscellaneous tools. The space beneath them in the bottom of the large box contains the protractors, reading glass and odd tools not in constant use. None of the tills are arranged with a distinct slot for each tool or part, but they are simply lined with some suitable material, the tools being laid in loosely. With such a box a handful of tools may be quickly gathered up when work is over and distributed each in its proper place, there being no waste of time in changing points, etc., to fit the notches of the ordinary case.

The larger and more expensive instruments, such as the planimeter, integrator, etc., are sold in special cases fitted to hold them without injury, and should always be kept in them. These cases should, if possible, be so made that the instruments can be stored away in any state of adjustment, without being opened or closed to some particular point merely to fit the case. This is an important detail, but one usually overlooked by the makers.

It is impossible to handle instruments without in time dimming the first polish, which can only be restored by the maker, and the most carefully used tools will inevitably show some wear, but they should never be allowed to rust. In the case of such complicated and ex-

pensive instruments as the planimeter, all parts should be wiped with a soft cloth after using to remove dust and the moisture of the hands, which will cause a little rust; but the dividers and other small instruments are hardly likely to get such care, nor do they suffer so much for the lack of it.

The great enemy of the draftsman is dirt, chiefly in the form of dust, which finds its way everywhere. To combat it successfully there is needed a common dust brush or feather duster for the drawing boards, tables, etc., which should be vigorously used before beginning work; a much finer brush reserved solely for the surface of the paper, for removing dust and also the particles of paper, ink and graphite produced by erasure, and third, a dust cloth for the scales, triangles, curves, etc. These all collect dust from the air and more or less moisture and dirt from the fingers, transferring them to the surface of the paper. Some of this dirt may be removed after the drawing is completed by the use of india rubber or of stale bread, but a good deal of it will remain. By way of prevention, the paper should be dusted before beginning work, the instruments should be wiped off with the dust cloth, and occasionally a slightly damp cloth may be used on scales, triangles, etc., to freshen them up. Too much water is likely to injure them, but a little carefully applied will clean them without damage.

The idea of cleanliness is more than a mere sentiment, as when it comes to the inking, good work cannot be done on dirty paper. The use of the drafting pen and india ink is by no means an easy matter, but one demanding skill, experience and care to produce good and reasonably rapid work. Even under the best conditions, with clean paper, clean pen, and ink freshly rubbed in clean water on a clean slab, the result is not invariably satisfactory; and with dirt present anywhere it cannot be so.

As previously stated, the common writing ink is absolutely unfit for drafting, or for use in the drafting pen, corroding the instrument and paper, and making a very poor line. The Chinese or "india ink," in solid sticks, has always been the standard material; but similar ink is prepared in liquid form and sold in small bottles. The use of this liquid ink has become quite general of late years, the quality probably being better than of old, and many professional draftsmen use it entirely. At the same time we know of no reason for so doing good enough to offset its marked inferiority to good stick ink. It is assumed that the preparation of stick ink is a slow and very laborious process, to be performed anew whenever a little ink is needed, while with the bottle ink it is only necessary to draw the stopper. There might be some truth in this if it were really necessary in all cases to follow the directions given for the preparation of the stick ink for the very finest drawing, both with the pen and in shading; to rub the stick of ink on the end of the finger and to rub the latter in turn on the ink slab, thus avoiding all grit and grinding the ink perfectly fine. For shading with the brush this process is necessary, as even the smallest speck of solid ink in the brush would spoil the work; for line drawing, however, it is quite sufficient to rub the stick ink directly in the saucer, or slab. A variety of china and stone dishes are sold for this purpose, a very convenient sort being of slate, about 4 in. square and 1 in. thick, with a

SAIL PLAN OF SAILING DINGHY.

saucer-shaped hollow, about 3in. in diameter and $\frac{3}{8}$ in. deep, in the center of which is a small hollow, like the end of a thimble, about $\frac{1}{4}$ in. deep. With this slab is a cover of plate glass.

The stick of ink should under no circumstances be dipped in water, nor even wetted any more than necessary. A little water is dropped on the slab and the stick is rubbed round and round with a gentle pressure until a sufficient amount of ink is ground off, when the end of the stick is carefully wiped dry. If left wet it will soon check and crack, leaving small lumps in the saucer whenever it is used. The stick should be handled carefully, and laid away in a drawer when not in use, as this ink sometimes cracks of itself into many pieces too small for grinding. A good piece once obtained, it will last so far as use is concerned for many years. After being rubbed, the ink should be tested by drawing a broad line and allowing it to dry, when it should appear of a dense black. It is quite likely that the line first drawn may show thin and brownish, in which case more ink must be rubbed up.

In any saucer like the one described, with an air-tight cover, the ink will keep for an indefinite time, a week or two at least, with no deterioration of quality, the slight evaporation will make it a little thicker and it may be even blacker than at first. If it becomes too thick to work freely in the pen, a drop or so of water may be added, the mixture being thoroughly rubbed up with the finger end. So far as the time and labor of rubbing are concerned, the one reason for resorting to the liquid inks, with the proper appliances, it is but a matter of five minutes in a week. Once prepared, there is no comparison between the stick and the bottle ink, the former is in every way superior. It is not always possible to select the right kind of stick ink, and in its absence, or in fact for those who do only occasional work, the better brands of the liquid inks, in particular "Higgins," furnish a passable substitute; but if one has much pen work to do, the sooner he discards entirely all liquid inks and provides himself with a good stick of solid ink, the better for his temper.

India ink is composed of carbon, sometimes lamp black and sometimes the coloring matter of the cuttlefish, compounded with a mucilage into more than a mere mechanical mixture. It does not soak into the body of the paper, like common ink, but lies on the surface, and if of the proper quality it is very black and practically indelible; though it may be almost completely removed without injury to the paper by means of a sharp eraser. It so happens that the ingenious Chinese counterfeits the shapes and markings of the best inks in the most inferior brands, so that the price alone is no guarantee of quality. Ink is tested by wetting the end of the finger and rubbing the stick; the result being a spot of more or less intense black, showing a luster when dry. A line drawn with the ink should show the same intense lustrous black when dry and should stand a good deal of hard rubbing with a soft pencil rubber (not the ink rubber) without losing its blackness or showing uneven spots; though its gloss and freshness will disappear. The ink should be kept closely covered at all times, even when in use, the cover being removed only for the moment when filling the pen and immediately replaced, both to exclude dust and to check evaporation. Should the ink stand so long as to

dry up entirely, it should not be mixed again, but the slab should be thoroughly cleaned for a fresh grinding.

The colored inks, blue, red, green, etc., like the black, are best ground from solid cakes of the regular artist's water colors; but they are much less used than the black and the small vials of liquid blue, red, etc., are more convenient than the frequent grinding of small lots of different colors.

[TO BE CONTINUED.]

The Canada Cup.

THE dates for the final races for the Canada cup have been decided, Aug. 4, 6, 8, the first being the Civic Holiday of Toronto. The new Hanley boat for the Rochester Y. C. syndicate is described as follows by the Boston Globe:

The most interesting boat of those now under construction in Hanley's Quincy shops is the one for the Rochester, N. Y., syndicate, to compete in the trial races at Chicago to select a challenger for the Canada cup. She is Hanley's first attempt at a design into which so many limitations enter as under the rules of the Yacht Racing Union of the Great Lakes, and he has, therefore, had to modify some of the well-known features of his Eastern boats. She is a "Hanley boat," nevertheless, with the flat floor, round bilge, straight topsides and "long side to sail on" which have marked his latest boats, but shows no reverse curve in the keel line, either forward or aft. She is also considerably narrower than a boat of the same length for Y. R. A. of M. rules, since she is to carry less sail.

The boat is 44ft. over all, 27ft. waterline, 11ft. beam and 2ft. draft. Keel and planking are flush on the outside, and all her ballast will be inside. She will have rather a long centerboard, and her rudder will be hung on a skeg running from just aft the centerboard. In construction she is fully up to the Union's table of scantling prepared by W. P. Stephens, and in some places is a bit stronger. Keel and frames are of oak, the bottom planking of hard pine and the top planking of cedar. She will have a good cabin, with 5ft. head room, but it will be very simply fitted. Her rig will be jib and mainsail.

Hanley's contract calls for the delivery of the boat in New York May 15. From there she will be taken by her owners through the Erie Canal and then sailed to Chicago. He is hopeful of her success, and it would mean a great deal to him. J. E. Burroughs, of Rochester, secretary of the syndicates, expressed himself as very well satisfied with the looks and promise of the boat on his recent visit of inspection, and says that she will be in good hands for her racing.

The boat is nearly planked and shows the usual Hanley excellence of work throughout. Her designer and builder expects to attend the trial races at Chicago.

The Cuthbert boat, for the Pearl syndicate, will be named Veva.

Aphrodite, Col. O. H. Payne's new steam yacht, arrived at New York on March 28 from her builder's yard, Bath.

The Quincy Challenge Cup.

THE cat is out of the bag at last. The Quincy Y. C. will not depend upon Recruit to defend its \$500 challenge cup for 21-footers against the challengers from the Lynn, Beverly and Hull-Massachusetts clubs, but will have a new boat, an up-to-date racing machine of the extreme "scow" type, against which Recruit will be used as a "trial horse" to determine her speed.

At the head of the syndicate, which will build the new boat, is Henry M. Faxon, who so successfully sailed Recruit in last year's races against Duchess, and he will sail the new boat with the best amateur crew the club can give him. Mr. Faxon has been a very successful sailer of catboats, with Rocket, Swirl and Cleopatra, and with his last year's experience with a jib-and-mainsail like Recruit, should be able to do the new boat full justice.

The new defender will be close to 40ft. long and have something over 9ft. beam. Although nearly as wide forward and aft as she is amidships, she will show a flaring side, and so should be better in light airs than those of the "scow" model that have a harder bilge and straighter side. She is booked to carry over 1,000ft. of sail. Some entirely new ideas in light construction are indicated. Her design is credited to Arthur Keith, and an endeavor has been made to improve on Recruit in the points in which that boat seemed weak, notably in stiffness of construction.

Recruit will be put in commission with some minor changes, and will be placed by Com. F. B. Rice at the disposal of the syndicate.

The building of this new boat by the Quincy Y. C. will greatly add to the interest in the races for the cup, and if the promises of improvement over Recruit be fulfilled by the new one, the challengers will have no easy task ahead of them. The races are now scheduled for the week of July 20, and promise to be the most interesting events of the season in strictly Boston waters. With four new 21-footers building there is, indeed, a revival of racing in the class that augurs well for the sport in general.

The Quincy Y. C. can take much credit to itself for this revival, through its offer of the silver trophy, and is entitled to the commendations of all who have the success of the sport at heart.—Boston Globe.

YACHTING NEWS NOTES.

Mr. Isaac Stern, of New York, has placed an order with the Bath Iron Works for a steel steam yacht 200ft. over all, 165ft. l.w.l., 26ft. beam, and with a speed of sixteen and one-half knots. She will be finished by the end of the year.

Mr. W. O. Gay, of Boston, has placed an order at Bristol for a 70ft. l.w.l. cutter, of composite build, to be ready for the New York Y. C. cruise.

Ramona, schr., formerly Resolute, has been sold by H. M. Gillig to Vice-Com. B. M. Whitlock, Atlantic, Y. C.

Rifle Range and Gallery.

Cincinnati Rifle Association.

THE following scores were made by members of the Cincinnati Rifle Association, in regular competition, at Four-Mile House, Reading road, April 2. Conditions: 200yds., off-hand, at the German ring-target. Gindele was declared champion to-day with a score of 219 on that target. Strickmier was high on the honor target to-day with a score of 66.

Gindele	21	23	19	22	20	20	23	23	24	21	—219

Shell Mound Range.

SAN FRANCISCO, Cal., March 27.—At Shell Mound range yesterday there was a glaring light, with a shifty wind. In the Germania Club contest for Bushnell trophy, 200yds., only one entry, the following scores were made: Faktor 224, Dr. Rodgers 221, J. Utschig 219, Schuster 218. In the yearly cash shoot, re-entry, 3 shots, 200yds., the only high scores were: Dr. Rodgers 73, 71; A. Strecker 73; J. Utschig 70.

In the Glendemann medal contests of the Columbia Club, at 200yds., Columbia Club target, A. Pape made the fine score of 38. Scores of the Columbia Club:

Lewis revolver trophy: C. Roberts 69, 76, 82. Siebe, all-comers' pistol medal: F. O. Young 44, 61, 73; J. P. Cosgrave 55, 64.

Twenty-two and .25cal. rifle medal: F. O. Young 28; Mrs. C. F. Waltham 40, 37; J. F. Twist 43, 49.

Glendemann medal, rifle: A. H. Pape 38, 42, 48, 46; F. O. Young 46, 48, 53.

Members' rifle medal: E. N. Moor 64, C. A. Bremer 72, G. Mannel 95.

Rifle at Conlin's Gallery.

THE rest rifle match, or "go as you please," shot on the seven bullseye target, re-entries, gold medals for second and third prizes, entries 25 cents each, distance 20yds., prize a sporting rifle, presented by Winchester Arms Co., resulted as follows. The first three men in this match tied, making the seven shots in measurement from the center of the bullseye to the center of each shot 1 3-16in. The following are the scores of the first fifteen competitors:

W. C. Southwick 1 3-16in., J. T. B. Thomas 1 3-16in., John W. Christiansen 1 3-16in., J. P. Stagg 1 4-16in., Peter Denise 1 6-16in., C. M. Brownell 1 9-16in., A. C. Goodrich 1 10-16in., W. J. Strong 1 10-16in., J. R. Fink 1 10-16in., John C. Groin 2in., J. W. Wellman 2 13-16in., W. C. Browne 2 14-16in., James Stanton 3in., W. Jackson 3 2-16in., John Williams 3 4-16in.

In shooting off the tie J. W. Christiansen won first, J. T. B. Thomas second and W. C. Southwick third.

The Laffin & Rand Powder Co. have had a multitude of orders for their new powder and samples of it, since they announced that it was on the market. A nitro powder, it is designed for use in rifles and revolvers built for the use of black powders. The company has received many gratifying testimonials of its excellence from men eminent as rifle and revolver shots. Some remarkable scores were made with it in the Smith & Wesson range, at the Sportsmen's Exposition. Dr. Ashley A. Webber, of Brooklyn, who used this powder at the Sportsmen's Exposition revolver competition, writes Messrs. Laffin & Rand as follows: "I used the new S. & W. military revolver, and had no trouble in making the scores I did. There was not a bad cartridge in the lot, and I am positive I could improve my score many points."

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

April 4-5.—Chambersburg, Pa.—Chambersburg Gun Club's spring live-bird and target tournament; open to all. J. M. Runk, Captain.
April 5-7.—Richmond, Va.—Tournament under management of W. C. Lynham. Targets and live birds.
April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament. Entries close April 4. Edward Banks, Sec'y, 318 Broadway.
April 18-21.—Lincoln, Neb.—The Lincoln Gun Club's second annual interstate tournament; targets and live birds; \$500 added. Geo. L. Carter, Sec'y.
April 17-22.—Baltimore, Md.—Prospect Park Shooting Association's tournament; \$500 added. Stanley Baker, Sec'y.
April 19.—South Hingham, Mass.—Annual tournament of the Hingham Gun Club.
April 25-27.—Kansas City, Mo.—Ninth annual tournament of the Missouri State Amateur Shooting Association, under auspices of Washington Park Gun Club; \$100 added money; target and live birds. Walter F. Bruns, Sec'y.
April 25-26.—Gretna, Neb.—Target and live-bird tournament; \$200 added; open to all. H. M. Hardin and C. B. Randlett, Managers.
April 25-28.—Baltimore, Md.—Tournament of Baltimore Shooting Association; targets and live birds; money added. Geo. L. Harrison, Sec'y.
May 2-5.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-third annual tournament, under the auspices of the Capital City Gun Club; six amateur and four open events each day; targets and live birds. R. M. Welch, Sec'y.
May 7.—White Plains, N. Y.—Live-bird handicap. E. G. Horton, Manager.
May 9-13.—Peoria, Ill.—Illinois State Sportsmen's Association's tournament. C. F. Simmons, Sec'y.
May 16-19.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. F. W. Bacon, Sec'y.
May 16-20.—St. Louis, Mo.—Tournament of the Missouri State Fish and Game Protective Association. H. B. Collins, Sec'y.
May 17-18.—Oil City, Pa.—Interstate Association's tournament, under auspices of Oil City Gun Club. F. S. Bates, Sec'y.
May 23-25.—Algona, Ia.—Tournament of the Iowa State Association for the Protection of Fish and Game. John G. Smith, Pres.
May 24-25.—Greenwood, S. C.—Annual live-bird tournament of the Greenwood Gun Club; 25-bird Southern Handicap. R. G. McCants, Sec'y.
May 26-27.—Tyrone, Pa.—Target tournament of the Tyrone Gun Club. D. D. Stine, Sec'y.
May 30.—Canajoharie, N. Y.—All-day target shoot at Canajoharie, N. Y. Charles Weeks, Sec'y.
May 30-June 2.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. Frank W. Bacon, Sec'y.
June 5-10.—Buffalo, N. Y.—New York State shoot, under the auspices of the Buffalo Audubon Gun Club; \$1,000 guaranteed; over \$2,000 in merchandise, and \$1,000 added money in open events. Chas. Bamberg, Sec'y, 51 Edna Place.
June 6-9.—Sioux City, Pa.—Fifth annual amateur tournament of the Soo Gun Club. E. R. Chapman, Sec'y.
June 7-9.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under the auspices of the Sherman Rod and Gun Club. J. C. Porterfield, Sec'y, O. T. S. L.
June 14-15.—Bellows Falls, Vt.—Interstate Association's tournament, under auspices of Bellows Falls Gun Club. C. H. Gibson, Sec'y.
June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.
June 20-22.—Wheeling, W. Va.—Third annual tournament of the West Virginia State Sportsmen's Association, under the auspices of the Wheeling Gun Club, Wheeling, W. Va. John B. Garden, Sec'y.
June 27-29.—Altoona, Pa.—Target tournament of the Altoona Rod and Gun Club, Wopsononock Heights. G. G. Zeth, Sec'y.
July 1-2.—Milwaukee, Wis.—Grand tournament of Milwaukee Gun Club, in Carnival Week. S. M. Du Val, Sec'y.
July 19-20.—Providence, R. I.—Interstate Association's tournament, under auspices of the Providence Gun Club. R. C. Root, Sec'y.
July 18-20.—Little Rock, Ark.—Arkansas State tournament.
Aug. 9-10.—Portland, Me.—Interstate Association's tournament, under auspices of the Portland Gun Club. S. B. Adams, Sec'y.
Sept. 6-7.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

Under date of March 30, Mr. J. J. Hollowell, the popular representative of the U. M. C. Co., writes from Cincinnati, as follows: "As you are well aware, the Clay Brothers, of the Hilltop Gun Club, are indefatigable shooters. They have shot sparrows, crows, pigeons, bats and bluebirds on their grounds, but their latest diversion is in shooting bumble bees. They have the niggers busy all summer catching the bees, keep them at a suitable temperature and next winter shoot them off. With that object in view, Mr. G. W. Clay visited Mr. Hill, of Indianapolis, he of sparrow trap fame, and ordered a special set of bee traps, arranged to have hot air connections from the club house. They are considering at the present time a programme for the first annual 'bee shoot.' One of the notes says: 'Mr. Alfred Clay will have his coop of well-trained game cocks to do the retrieving. No shooter will be allowed to retrieve. Shades of our ancestors! but here is a chance for U. M. C. Thomas to formulate a 'bee load' that will go down in history as a world beater. The boys say that have shot everything that flies until it became too easy, and they looked around for something smaller. Well, I think they have it, don't you?'"

Mr. A. Kleinman, of Chicago, seems to be something of a shooter for a man who was considered one whose best was of the past. At Chicago, in a two-men team contest, he killed 23 out of 25 birds, which is a reasonably good gait, and one which many find it difficult to follow. His team mate was Mr. J. H. Amberg, who killed 19, defeating Messrs. E. S. Graham and E. E. Neal, whose scores were respectively 21 and 20.

On Thursday of this week, Smith Brothers' Foundry and Ferry streets, Newark, there will be an open shoot, 20 to 25 live birds. Shooting commences at 11 o'clock. There will be a wagon at the trolley car to meet visitors.

The two famous Pennsylvania trap shots, Messrs. Harry Coldren, of Reading, and Fen Cooper, of Mahanoy City, shot the second of their series of three live-bird matches, at Reading, on March 31. Coldren scored 42 out of 50; Cooper 39.

Owing to pressure of business matters, Hon. T. A. Marshall, of Keithsburg, Ill., we are informed, will be unable to act as one of the G. A. H. handicap committee. The veteran Mr. C. W. Budd, of Des Moines, Ia., has been invited to fill the vacancy.

The long-postponed match between Messrs. Quimby and Banks vs. Keller and Waters, came off on April 1, and those who attended on that day were not fooled. One of the teams won handily. The conditions were: 25 targets and 25 live birds per man. There were quite a number of excuses why one team lost, but the excuses did not count in the scores. Another match may be made and shot some time—perhaps.

In a match at 50 live birds each, for a purse of \$100, Mr. J. A. Lane defeated Mr. H. Steege, at Waterloo, Ia., on March 29. Dr. Kibbey, the well-known shooter, acted as referee. The scores were: Lane 42, with one dead out; Steege, 38, with four dead out.

Mr. George W. Mains, secretary of the Enterprise Gun Club, Reynoldton, Pa., writes us that at a meeting of the club, officers

R. A. WELCH, 1893.

were elected as follows: President, Fred Stephan; Vice-President, John Owens; Secretary, Geo. W. Mains; Treasurer, J. F. Calloun; Captain, Wm. H. Crouch.

The programme of the St. Louis Shooting Association is touched upon by Mr. Herbert Taylor, in Mr. Banks' communication, published in another column. The programme is on perfectly correct lines, guarding the interests of all concerned in a perfectly equitable competition. The amateur who loves competitive sport will find in this programme opportunities seldom offered. H. B. Collins, Sec'y.

The handicap committee of the G. A. H., on April 6 of this week will engage in a task which in the way of handicapping, far exceeds in difficulty anything of the kind which has occurred before in this country. The handicapping of such a great number of shooters, many of them known, many unknown, will probably take two days of diligent work.

The New Brunswick Gun Club, of New Brunswick, N. J., is making an effort to revive interest and activity among its members in trap-shooting matters. It will endeavor to secure new

THOMAS W. MORFEY, 1894.

grounds in a more convenient location. The list of officers elected is as follows: President, William E. Sperling; Vice-President, J. A. Blish; Treasurer, Joseph Fisher; Secretary, Reuben McDowell; Captain, Clarence Oakley.

Mr. Elmer E. Shaner, manager of the Interstate Association, arrived in New York on Monday of this week preparatory to assuming the duties as a member of the handicap committee, and manager of the Grand American Handicap. He is not in the best of health, and further is suffering in spirit from bereavement, having suffered the loss of near relatives.

The entries to the Grand American Handicap, up to 3 o'clock on Tuesday afternoon, April 4, numbered 247. With those which will be received later, and with posted entries this number may be quite materially increased.

It is a peculiar feature of trap-shooting that, though a man may drift into the has-bens, he may revive and become a very lively factor of the present.

In the final shoot of the Crescent Athletic Club's trap-shooting season, April 1, one of the events was the consolation handicap, open to members who had contested, but who had not won a prize during the season. There were five contestants, namely, Messrs. J. S. S. Remsen, Wilmot Townsend, C. G. Rasmus, L. Rhett and Henry Werleman. The prize was won by Mr. Remsen, who broke 23 out of 26. Mr. Charles Sykes won the Marlin repeating rifle.

Messrs. Rolla O. Heikes and W. Fred Quimby, have been discussing their relative merits as pigeon shots, with the result that they arranged to shoot at 25 live birds at Elkwood Park, Long Branch, on Wednesday, of this week for a brand new hat. Whichever wins, the same size of hat will fit after the match that fit before.

Mr. E. G. Horton, of White Plains, N. Y., will give a live-bird shoot on May 6. The programme will be arranged with a view to good amateur competition. He will engage the Fair grounds for the purpose, which are said to be most excellently adapted to a tournament.

Concerning Tom Morfe's birds and the scores recently thereunto appertaining, it might not be amiss for each shooter to suspend judgment till he tries them himself. There are a few here and there which are unkillable, and a few which are unshootable.

The records indicate that Mr. Fred Gilbert has been doing some very excellent shooting with his Winchester gun in his practice shoots at Watson's Park, Chicago, during some days past. On March 27 he killed 31 out of 32, which is a gait to be considered with respect.

The match for \$500 a side between Messrs. W. Cashau and R. L. Packard was shot on Morfe's grounds, Lyndhurst, N. J., on March 30. The former stood at 30yds., the latter at 27. Each shot at 50 birds. Score: Cashau 28, Packard 39.

The Tyrone, Pa., Gun Club will hold a target tournament on May 26 and 27. The club is a new one. In reference to it, Mr. G. G. Zeth gives full information under the head "Altoona Rod and Gun Club," elsewhere in our columns.

The number of reasonably sure winners one hears of in reference to the G. A. H., and the G. A. H. cup, before it is shot may be decreased appreciably toward the latter part of next week.

Mr. L. S. Garnier, of the firm of A. B. Garnier & Son, Easton, Pa., was in New York early this week on a business trip. He is famous in his State in matters pertaining to the gun.

Mr. Irby Bennett, representing the Winchester Repeating Arms Co., in the Southwest, arrived in New York last week and will remain till after the Grand American Handicap is decided.

Leroy is in fine form at present. At Centredale, R. I., recently, he broke 49 targets straight, and finished with 97 out of 100, a score of the highest excellence.

The Boston Gun Club begins a new series of shoots on its grounds at Wellington, Mass., commencing April 4.

BERNARD WATERS.

Trap around Reading.

READING, Pa., March 31.—With the score of 42 kills out of 50 live birds to-day at the Spring Valley Shooting Park, Harry Coldren, of this city, defeated Fen Cooper, of Mahanoy City, who succeeded in killing only 39. The match was the second of a series of three shoots, and was at 50 live birds, 30yds. rise, Hurlingham rules, for \$100 a side. A large crowd of people witnessed the match, among them being a delegation of Mahanoy City rooters, who came to Reading to back Cooper. Betting was quite lively before the match began, and thus a considerable amount of money changed hands. The birds were a fair lot of flyers, and some caused trouble to the shooters toward the end, as a strong wind began to blow toward the end of the match. James Schmeck, of Cacoosing, Pa., was referee, and Arthur A. Fink, of this city, scorer. The score follows:

Trap score type—Copyright, 1899, by Forest and Stream Pub. Co.

Pottstown, Pa., March 31.—The target tournament of the Shuler Gun Club, of this city, held to-day, on the East End grounds, was a grand success. Shooters were present from Reading, Boyertown, Limerick, and shooting kept up until dark. A new feature was the introduction of shooting incomers by placing a trap out in the field to throw toward the score. The special event of the day was event 8, 20 targets. First prize, automatic loading outfit, which was won by Grubb, with the score of 17. The scores of the different events follow:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

DUSTER.

Chart Oak Handicap.

CHART OAK, Pa., March 31.—A large crowd witnessed the competition in the Charter Oak handicap, which was contested here to-day. There were twenty-eight entries. The conditions were 25 live birds, entrance \$10, birds at 35 cents per pair, Rose system, Interstate rules to govern.

Two men killed straight, namely, H. B. Fisher and H. E. Buckwalter. Howard Ridge lost but one bird and took second money alone. Schwartz, Greener, Trumbauer and Henry tied on 23. The scores:

J. Edwards, 26	2210111201212221021120212-21

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

IN NEW JERSEY.

Trap at Lyndhurst.

Banks—Quimby vs. Keller—Waters.

April 1.—No better day could have been selected for the long-pending match between Messrs. Banks and Quimby on one side and Messrs. Keller and Waters on the other. The match had waxed fiercely at times, and waned at others into such attenuation that it seemed lost. Referring to April 1 as being a good day, the weather, and not the associations of April 1st as a day of the unwise, is in mind. It was a true April day, with quick changes from sunshine to shadow, and fitful breezes blowing from 8 o'clock. This match has seen many fluctuations. If any two seemed out of form, the other two were quite courageous and talkative. If any three were ready, the fourth was out of town. If any one was ready, there was something which absolutely prevented the other three from shooting. At length this match, which on Friday of last week seemed to be peacefully dormant, broke forth into an activity which would not be denied. In an unhappy moment T. K. put up a forfeit of \$5, notwithstanding he had put up a like forfeit a week before, which was applied to the purpose of purchasing shad roe and bacon, roast beef rare done and coffee with cheese. Waters received a peremptory notification on April 1 that the match was on. Calling to consult the opposing principals, he pleaded that he had not been consulted in the matter, that he didn't have his gun, that this, that and the other thing interposed, but he was calmly overruled. He took two strange guns to the grounds, then borrowed Mr. Heikes' gun to shoot the match; probably if he had had three or four more guns he might have done better.

There was a good and appreciative audience, among whom was Capt. Dressel, of the U. M. C. Co., and Messrs. Money, Morley, Keegel, Hassinger, and others. Mrs. M. F. Lindsley and two other ladies were present. Capt. A. W. Money refereed the team race most satisfactorily.

En passant, it may be remarked that shooting this match utterly spoiled it. As it stood before it was shot, it seemed a very good match. After it was shot, it was different. T. K. sang a few verses about it, the refrain of which was, "But we'll never shoot this any more." T. K. remarked further that his team had made two mistakes, the first of which was in making the match. The second was in shooting it.

The targets were a hard proposition, owing to the close proximity of trees, and the old barn straightaway in the background.

a side, the largest individual race of the season, and considerable money changed hands in the result, some \$2,000, it is said, was wagered before the match commenced.

Packard won easily, we understand, Cashau being away off. Score 39 to 28.

We arrived a little late, and found the first sweep under way. It did seem good and like old times to meet the old boys, and we were most cordially greeted. The Count, the same erect martial figure of years ago, but with mustache and goatee decidedly whitened, still shoots well, and we were pleased to see how he held his gun well down until the bird was on the wing. That is sportsmanlike, and he was the only one that we noticed did it. His score under such circumstances is the best. Frank Hall, Neaf Apgar and young Money were of course well to the front. The birds were not a fast lot, only two or three showing any

Two 10-bird sweeps followed, 10 birds, \$5, three moneys, Rose system, points 6, 3 and 1:

Morley, 30	2222200222	8	30	2022212212	9

Wanda			26	2100112020	6

In a miss-and-out which followed, five entries, \$2, Harold Money killed 8 and won alone.

Centredale Gun Club.

CENTREDALE, R. I., April 2.—Editor Forest and Stream: Our opening shoot, held yesterday, brought out twenty-five shooters. The day was pleasant enough, with the exception of a north-westerly wind, which blew right across the field, making the shooting rather uncomfortable. Many visiting shooters were present, among them being Leroy, of Campello, Mass.; Walls, the genial secretary of the Worcester Sportsman Club; Coffin, of Whitinsville, Mass.; President Mills, of the Woonsocket Gun Club; also Leon Campbell, of the same club, and besides these visitors were most of the trap shots of the State.

The remarkable shooting of Leroy won the admiration of all, setting a warm pace, with 49 straight, and finishing with 97 out of 100, which is a very good score in better weather conditions. When Leroy wasn't shooting, he was talking Du Pont powder and Remington gun, trying to convince the boys that that was the combination that would win the American Handicap, and surely no one could have disputed that fact had they been there, watching him smash targets with that quickness in which he easily excels.

The handicap, which was the fifth event, had a large entry, and was won by Dr. Hammond, with a clean score of 25, over which the Doctor was highly elated. Mills was second with 22, including 5 extra to shoot at. Bain and Richards tied for third with 21. Root fourth with 18, and Griffith and Remington tied for fifth with 17.

This handicap will be shot every two weeks until October. The prizes are gold medal, leather gun case, hunting suit, shooting blouse, 100 loaded shells, Powers' cleaning rod, and 50 loaded shells. Winners of each shoot receive 5, 4, 3, 2, and 1 point. One

O. R. LICKLEY, 1896

great celerity in rising or getting away. The Supervisor must do better if he wants to draw the old reliables.

Wanda would not get mad, and we think the gun stock too long for her to shoot quick. We have seen her do much better. The opening was a success; the chowder was excellent and ample; the attendance all that could be asked.

We hope for a golden future in Capt. Outwater's new venture as host.

JACOBSTAFF.

Packard vs. Cashau.

March 30.—The match between Mr. W. Cashau and R. L. Packard was shot at Morley's grounds, at Lyndhurst, N. J., on March 30. The conditions were \$500 a side, Cashau standing at 30yds., Packard at 27. This was really a most disastrous arrangement, for Cashau, as 30yds. on Morley's grounds, with his fast straightaway birds, is about the same as 22yds. on ordinary grounds. Cashau had 6 dead out, which also is a feature of the 30yd. mark, if one is not a shooter of extra quickness.

The old barn close by the boundary straightaway affords a most attractive haven for wounded or missed birds, and perched on the roof, they act as decoys for the birds flying from the traps.

THOMAS A. MARSHALL, 1897.

There are very few incomers. Following is the score, with flights, traps, etc.:

Trap score type—Copyright, 1899, by Forest and Stream Pub. Co.

W Cashau, 30	0 2 2 2 0 2 * 2 2 2 * 1 0 1 2 2 1 0 2 2 0 0 1 0	15

N. F. REINER, Sec'y.

Buffalo Audubon Gun Club.

BUFFALO, N. Y., April 1.—In the contest for the Hebard trophy, George McArthur proved to be the winner at the Audubon Gun Club's shoot to-day. He now has won it four times:

His score was 26 out of 30, and with 3 added, a total of 29.

Event No. 3 was the club's badge shoot. C. S. Burkhardt won in Class A, T. B. Walker in Class B, and Porter in Class C.

Among the visitors was E. C. Bald, who tried his hand at the trigger and did remarkably well for a beginner, and H. S. Weller, of Utica.

H. D. Kirkover's shooting was wonderful, as he scored 95 out of 100 shot at, in spite of the heavy wind and snowstorm which prevailed:

* Badge. ** Trophy.

JOHN G. MESSNER, 1895.

When it came to live-bird shooting, the old barn, with the chasm in its roof and large open windows, seemed to have a real draft for the birds when released from the traps. They were a corking lot of birds, swift, strong and with unlimited vitality. Most of them were straightaways, which flew direct for the old barn just beyond the straightaway boundary.

Following are the scores of the match entitled:

But We'll Never Shoot This Any More.

Team match, 25 targets, 25 birds:

Steffens.....1112111-7 Heflich.....2212110-6

Jersey City, N. J.—On March 29 ex-Supervisor John Henry Outwater, one of the old-time shooters of New Jersey, when pigeons from the trap had a chance for life, and skill and accuracy counted instead of the present merciless system, has recently gone into the boniface business, having put up a commodious hostelry on the further bank of the Hackensack on the old Paterson Plank road, contiguous to the snipe and fishing grounds. He threw open his club house and traps to his many friends. It was a very pleasant affair, though there was not so many present as expected, owing to a certain extent to a big shoot at Morley's grounds, Lyndhurst, between Wm. Cashau, of the Cobweb Gun Club, and Robert Packard, and this took off many of the local shooters. As it was a match for \$500

THE G. A. H. LIST.

SUBJOINED is a list of the competitors, with their handicaps, number killed and missed, from the first year, 1893, to the last, 1898. The letters y., k., m. under the different years indicate yards, kills, misses. This gives a most complete statistical history of the greatest of American shooting events.

Confabulations of the Cadi.—XVII.

Pooling of Interests.

THE Cadi and Moke arrived early on the grounds on the morning of the second day, to the end that they might have everything perfected so far as they were able to do so, thereby avoiding many of the unpleasant and unprofitable incidents of the day before. They had learned the lesson that, if the machinery breaks down or stops, the revenue is impaired accordingly.

The Cadi looked rather worn and passed. He was very much fatigued at the end of the previous day, and Hople Jane in consequence was more than ordinarily alarmed for his safety, in so much so that, as he sat lolling in his easy chair, she found it necessary to heat and administer two large pitcherfuls of cider to him, after which he, with seeming reluctance, ate a hearty supper, then took a stiff dose of morphine and slept well through the night.

"Before we begin, good Moke," said the Cadi, "let us sit ourselves down and rest a while, for I am weary."

"Weary!" commented Moke in surprise, "why the day has not yet begun, and you have done nothing yet to make you weary."

"It makes me weary to think of work, my good friend. Men of a gross fiber never have these finer feelings concerning physical or mental effort. Even with them, work is entirely an acquired habit. No sensible man, according to my view, ever was born with an instinct for work. I would do violence to my convictions if I asserted that I liked to work. But now that we are committed to the labors of this day, will you tell me what plans you have made for conducting the live-bird shooting, and thus we may proceed quickly and understandingly?" saying which the good Cadi stretched himself at length on a bench with much apparent contentment.

"We have formed a number of plans for the day, and I think that we should make a little money if they work all right. You know that we will have almost an entirely different crowd here to-day, only one or two of the target shooters of yesterday being live-bird shooters also. Five of our own club members have agreed to shoot the live-bird programme clear through and pool the results. They are pretty fair shots, and as I will do the handicapping myself, I will see that they are not placed too far back."

"If you were to keep in mind that you could also place some of the visitors well back, it would also assist somewhat," said the Cadi, with a most benevolent expression.

"Certainly, certainly," Moke acquiesced. "But we've a pretty safe advantage in another way. Each one of our men will know which trap will be pulled when he goes to the score."

"Oh, yes; I see," said the Cadi, now showing signs of animation. "I suppose the puller will move the rope of the trap that is to be pulled as our man goes to the score, and the wrong rope for the others if they should happen to suspect anything preconcerted."

"N-N-N-No, No," replied Moke, with much rising emphasis, "that would not do with the talent which will be here to-day. They would detect it in a short while. We have arranged a better method. The trapper scratches his head with one finger, or two or five, which correspondingly indicates which trap will be pulled; one of our party stands well away to one side from the trapper and grasps the railing with one hand, showing one finger, or two or five, thus repeating the signal, though it is not visible to those who are not in the pool. Great idea, isn't it?" Both rubbed their hands together and chuckled merrily.

"Who are the members of our club who will shoot?" queried the Cadi.

"Why, Catawauler Tityrus, Sure Thing Twist, Divide Always, Fatty Sliver and Long Green have all pledged themselves to come, and a number besides are in the pool financially, although these mentioned, our best ones, will do the shooting. We should with this combination win everything in sight."

Just then a farm wagon drove up with several crates of birds for the club. Most of them were dull and weak. This the Cadi noted and commented upon. He intimated that Moke should have secured good birds.

"Cadi," exclaimed Moke, with some impatience, "these birds cost quite a sum less than would first-class birds or even better birds. We save good money on the first cost. More of these birds will be killed than would be if they were first-class, and we therefore will have more dead birds to sell, so that, with poor birds, we catch the profits going and coming. Then again, when we get a really good bird, we can have the puller spring it on some of the strangers within the gates, and thus we have a competition which is conducted in a really intelligent manner." Moke closed his left eye and rubbed the side of his nose with his forefinger as he looked at the Cadi, who smiled responsively and seemed to be quite satisfied that all was for the best.

The shooters soon began to arrive, and entries were made in the first event, 15 birds, \$10 entrance, birds extra.

It is a peculiar feature of live-bird shooting that the shooter is nervously keyed up to a much higher pitch and feels altogether different from what he does when shooting targets. He first of all stands at the score alone, and has the center of the stage as it were for the time being, whereas in target shooting his individuality is lost in that he is but one of a squad. Then there is a different emotion when prepared to shoot at something which is actually alive from that which one feels when shooting at inanimate things.

Thus, when Rooney, one of the target shooters, went to the score, his knees were weak and shaky. He had to brace and stiffen himself to conceal his trepidation and to steady himself for the shot. He got a bird from No. 3 trap and killed it with the first barrel nevertheless. As he turned from the score, his face wore the happy look which may be seen on the faces of sleeping babes which are dreaming of angels.

Refereeing Without Thinking.

Sure Thing was next. He got a hot incomer from No. 1 trap, shot behind it with the first barrel, and, making the same error in part with the second, shot one leg and a part of the tail off, which fell two or three yards away, precisely on the boundary. The bird continued on its flight and disappeared in the blue horizon. The mangy dog, which acted as retriever, galloped about frantically, and barked sharply at every jump.

"Dead bird!" said Moke, who was refereeing.

Immediately there were angry protests from every side. "Lost bird!" "Lost bird!" "Where are your eyes, man?" etc., etc., were shouted.

"Easy, friends," said Moke, as he raised his hand to impose silence. "I am conscientiously refereeing this shoot under the rules, and under the rules that bird is a dead bird."

"You're crazy," said Rooney. "A bird which flies away before our very eyes cannot possibly be a dead bird."

"Perhaps you may know more about it than the rules," re-

torted Moke. "But when I say that the bird is dead and have the rules to back me, I consider that it is useless to talk further over the matter."

"Show us the rule!" "Show us the rule!" cried several, impatiently.

"All right; since you insist," Moke replied. He pulled a small booklet from his pocket and read as follows: "'Should any portion of the bird be on the line or touching it, such bird shall be declared a dead bird and shall be scored as such.' Do you see that leg and tail feathers exactly on the line. Aren't they a portion of the bird? If they are a portion of the bird, then the rule is very explicit—the bird must be scored dead."

"But the rules means that the bird is lying on the line, part within and part without," objected several.

"Then why doesn't the rule say so?" Moke retorted. "On the contrary, it says if any portion of the bird is on the boundary line. Now, a portion of that bird is on the line, and that portion you will admit is dead. Even if I were to violate the rule and say the bird was lost, it would not be true, for here is this portion of it on the ground before us, and it is certainly dead. A part of the bird has been saved, so it is not all lost."

"But 'portion' means a part of the whole bird in its entirety," objected Rooney, strenuously.

"Isn't a 'portion' the same also when it is removed," retorted Moke. "When you order a 'portion' of roast beef, do you expect the waiter to bring you the whole carcass of the ox? I believe myself that the bird is a lost bird, and that the rule meant to say so, but didn't. But I can't drag in my personal opinions into the matter, for I am too conscientious to do other than what the rules require, particularly when Sure Thing is a member of our club."

"If this kind of sure thing is going to continue, we'll quit," said Rooney, and several eagerly added, "Yes, we will." But they all continued shooting just the same.

Fatty Sliver rocked easily sidewise to the score, as he shifted from right to left to catch his centers of gravity, which were wide apart. He shot his left barrel first and his second misfired.

"Lost bird!" declared Moke.

"What?" exclaimed several in unison.

"Lost bird, if you must have a decision repeated before you can understand it!" replied the referee.

"Probably you find that in the rules?" commented Rooney, who also wished to be sarcastic.

"Certainly, of course I do," Moke replied, "and to save a long and tiresome discussion such as we had a while ago, I will at once read the rule to you;" whereupon he read it as follows: "'If the shooter's gun misfires with the right barrel, and he does not fire the second barrel, he shall be allowed another bird.' Now you will observe, gentlemen, that it was Fatty's right barrel which missed, and as there was only another barrel that must necessarily have been his second, which he fired. It is true that he technically fired his second barrel first, as it is also true that it was his right which misfired. The right being first under the rules, the wrong barrel was first in fact. Therefore it is a lost bird."

"But 'right barrel' means first barrel," objected several.

"The framers of these rules knew the difference between a first barrel and a right barrel. If they had meant it as you say they would have so said. I am further convinced that I am right because of the caption to the rule, namely, 'Misfires with Right Barrel.' If a shooter shoots his second barrel first under my ruling he does so at his peril," and Moke glared at the throng which gathered about him.

"All right," retorted Rooney. "We might as well go and shoot, for it is a fruitless task attempting to drum any sense into your head."

"Wait a bit," exclaimed Fatty. "I protest the decision on the ground that the referee exceeded his authority and had no right whatever to make the decision excepting by implication. Rule 2, entitled 'Duties of Referee,' declares that the referee shall see that the traps are properly set at the beginning of the match and kept in order to the finish, and kept properly filled; and on request he must test cartridges for improper loading. There is nothing more. That is all allowed the referee in the way of duties. It is not your duty to referee, for the rules, having defined your duty, withhold what is not allowed. You simply look after the traps and loads."

"You are foolish," retorted Moke. "I have it on good authority that any good referee can adjudicate well under these rules."

"The rules are good rules," replied Fatty. "But the fact that a good referee could adjudicate properly under them is outside the issue. Such a referee could act well under any other rules or no rules at all. That plea is a begging of the question. Whether a referee could or could not do certain things has no bearing on inaccuracies of statement, loose construction and redundant clauses. The imperfections are there, just the same, regardless of who is referee."

"The matter is no longer before the referee. It is already settled. Next man to the score," and Moke looked far from pleased with his job.

Long Green stepped to the score with a pump gun. He was unfortunate in having a misfire when he pulled the trigger for his first shot. He handed the gun to the referee, as the rules require. Moke saw that the hammer was down, and he promptly decided that it was a misfire.

"That will not do," said Long Green, by way of protest. "You are a great stickler for observing the rules, and the rule on this point is as follows: 'Whenever a cartridge misfires, the shooter must on no account open his gun, but shall hand it to the referee for his inspection, and it shall be the referee's duty to try both triggers without having previously opened the gun for the purpose of cocking it.' Now I insist that you pull both triggers on that repeater, as the rule requires. It states 'whenever,' and this is one of the whenevers."

"But there is only one trigger on this gun, and you are trying therefore to exact an impossibility," Moke replied.

"The rules are there, it is so in them, and we expect you to work according to them," was the retort.

"But misfires are provided for in case of repeaters," answered Moke.

"Not at all," rejoined Green. "When the brass shell pulls away from the paper, or when the extractor fails to extract, the rule allows another bird; but there is no mention whatever of a misfire."

"Well, then, I allow another bird, because the extractor failed to extract," replied Moke promptly.

"But I did not pump the action," said Green.

"That is not the issue at all. The extractor is the subject, not you. Now, the extractor either extracted or it did not. It did not. It therefore failed. The matter is settled. Another bird."

"Green shot and grassed his bird neatly."

Divide Always was the next man at the score. His bird was wing-broken, and dropped near the boundary. The dog rioted around in a senseless attempt to locate it, but failed.

"Call that dog in!" cried Moke, in a peremptory voice to the handler. Turning then to Divide, he said, "You have just two minutes in which to gather that bird." Divide placed his gun on the platform and was starting hastily for the bird, when Moke exclaimed, "Hold on! You can't go for that bird till the dog comes in to his handler." The dog meantime was running about lawlessly, entirely disobedient, and it was quite five minutes before the handler could get him in hand. "Lost bird!" ruled Moke.

"Lost nothing," exclaimed Divide, excitedly. "I have been studying the rules myself, and this is what governs the case: 'Then, as soon as the dog has returned to his handler, the shooter, or some person designated by him, shall go to gather the bird, and the time limit of two minutes shall commence from the time the dog returned to its handler.'"

"That seems very sound, it is true," admitted Moke, "but I was working on the clause which precedes that one, which is as follows: 'Where a dog is used for retrieving birds, if the dog cannot locate the bird, the time limit shall not be considered to have commenced until the referee has directed the handler of the dog to call the dog in.'"

"Well, which clause governs?" queried Divide.

"Give it up," replied Moke.

"I should, however, presume that the clause you read governs the matter, but if so of what use at all is the other clause?"

When at length it came Rooney's turn again he dropped his bird near the dead line. The bird was hard hit in the body, but was still vigorous, and if the dog rushed upon it, it would to a certainty flutter out. It was weakening as every second passed. Rooney, observing this, stood at the score, and neither turned nor opened his gun.

"Why don't you order the dog sent to retrieve?" demanded Moke, impatiently.

"That's entirely my affair," was the retort. "I am only taking my rights under the rules. I want that bird to die before I call for the dog."

"I will order him sent myself if you do not do so immediately," said Moke, with some asperity.

"That is entirely outside of your authority. The shooter has the authority in this case. Look at the rules and learn all of them instead of a part!" said Rooney, saucily.

Moke read as follows: "'The shooter after firing must call 'Man' or 'Dog'; should he fail to do so, the opening of his gun shall be considered as a signal by the handler to let the dog go.'"

"In that case," said Rooney, "you will please wait till I open my gun before the dog is sent for the bird. I will open it when I feel that that bird cannot fly."

Generosity.

At the end of the day the home talent had most of the money, which had been put up, and a jolly good time beside. Several had lost some money, but Rooney was "broke." He had not a cent left. In this strait, he went to the Cadi and asked for a loan; but the good Cadi, whatever might be his inclination, was never in a position to loan money.

But there is a beautiful trait among the fraternity of trap-shooters, which is that a stranded brother who has lost his money is sure to receive sufficient assistance to insure his return to his domicile, or at least from the shooters' vicinity. There was a little running around and private talking one with another, and after a while a railroad man, who was present, was prevailed upon to furnish him a pass and get him out of the country.

I trust that the wise and gentle reader will excuse the apparent egotism displayed in the use of the personal pronoun, which I find to be more or less essential at this juncture. I thought that a bit of spirited poetry, apropos of the generosity of trap-shooters toward each other under circumstances similar to those aforementioned, would give a touch of color and sweetness to this noble trait, but, rake my memory over as carefully as I would, I could not find anything even remotely worthy of so delicate association. In this dilemma, I turned to our Editor-in-Chief, Mr. C. B. Reynolds, and asked his advice on this point, with a feeling of certainty that I was thereby in a fair way to save the day. After glancing over the MS. in a nonchalant manner for a few moments, he assured me that the matter was one in which the poetry was necessarily made to order to secure a proper fit, as nothing in the regular stock would serve with just precision; then he asked me directly: "Why do you not write the needed poetry yourself?"

I confessed that I had tried some years ago, but did not meet with the encouragement which filigree work in words deserved. "Well," he remarked, "the writing of poetry in general is difficult, if it be good; but writing poetry which is good enough for this is easy. I will assist you myself." Thereupon he calmly wrote, off-hand, as follows:

The Golden Rule.

(In its application to Coon Hunting.)

A sportsman true from Kalamazoo
A-cooning came to the Kanakakee;

For there, 'twas told, the creatures grew,
A flock of coons to every tree.

But lost in the mazes of Kankakee,
He began to boohoo for Kalamazoo;

And since he'd spent his very last V,
Unable to quiet his hullabaloo,

They shipped him free from Kankakee—
Deadheading him through to Kalamazoo.

"For," said the benevolent Kankakeans,
And this they wrote to the Kalamazoans,

"As we'd have you-uns do to we-uns,
The same should we-uns do to you-uns."

BERNARD WATERS.

The third annual spring tournament of the Bison Gun Club, Chas. H. Werlin, secretary, to be held April 5 and 6 has a programme of targets and live birds, the first day devoted to the former, the second to the latter. There are ten target events, varying from 10 to 20 targets, 200 all told, with a uniform entry of 75 cents, a total of \$7.50 for the day. Three dollars are added to each event, making a total of \$30 for the day. Twenty per cent. will be deducted from purses of those making 90 per cent. or better, to be divided equally among five contestants, who make the lowest scores, shooting through the programme. Those who wish can shoot for targets only. On the second day there are three live-bird events. Nos. 1 and 2 are at 10 live birds, \$3 entrance, both open to all. No. 3 is the Bidwell trophy, at 25 live birds, \$13.75 entrance, birds included. Shooting on this day begins at 9:30.

Mr. E. E. Lincoln, Boston, writes us that on April 19 the annual tournament of the Hingham Gun Club will be held on its grounds at South Hingham, Mass. The principal event will be a handicap race of 100 birds, known angles, \$5 entrance fee. This shoot is looked forward to by all the cracks of western Massachusetts, and a large crowd is sure to be in attendance.

ON LONG ISLAND.

Hell Gate Gun Club.

New York, March 29.—The monthly shoot of the Hell Gate Gun Club was held at Dexter Park, L. I., on March 28. Despite the beastly weather, thirty-eight members and three guests faced the traps. The birds were a fast lot, and a strong incoming wind made them very erratic in their flight.

At the last meeting of the club, held at their headquarters, 1355 Amsterdam avenue, the president, John H. Voss, was presented with a diamond charm, as a recognition for his long successful management of the club, and his good fellowship. A good old sociable time wound up the evening or rather night.

E. DOENICK, Sec'y.

New Utrecht Gun Club.

Woodlawn, L. I., April 1.—A strong westerly wind was blowing, which caused the targets to dip, and made the shooting difficult. In the gun shoot, P. E. George and D. Deacon tied, and in the shoot-off P. E. George won; this being his third win, the gun becomes his property. After this event George challenged Gaughen for the plate, which he won. Gaughen had on five previous occasions successfully defended it.

Club shoot:	011100000000111001001010w

P. E. George	

Brooklyn Gun Club.

Brooklyn, April 1.—The scores of shoot April 1 are appended. As you will see by them, the shooting was hard, as the wind blew a gale. The ninth event was a prize shoot, a fine leg of mutton gun case, 25 targets, \$1 entrance, birds included, handicap. Chas. Dudley was the lucky one. The handicaps follow the names:

Events:	1	2	3	4	5	6	7	8	9
Targets:	10	10	10	15	15	15	15	20	25
Dudley, 8.	6	6	7	12	11	11	11	11	22

JOHN S. WRIGHT, Manager.

Oceanic Rod and Gun Club.

Rockaway Park, L. I., April 3.—The Oceanic Rod and Gun Club held its regular bi-weekly shoot on the first day of this week. The weather was not very favorable for making high scores, a stiff breeze and snow squalls quite frequently prevailing. Scores are as follows:

Events:	1	2	3	4	5	6	7	8	9	10	11
Targets:	25	25	25	15	10	25	25	25	25	10	6
Dr. Hill	18	20	16	10	5	18	18	19	21	8	3
A. Schubel	12	14	13	6	10	15	11	11	11	11	11
T. Dittley	8	11	5	6	10	10	10	10	10	10	10
C. Dudley	19	13	7	18	18	20	17	6	5	10	10
G. Leoble	12	11	11	11	11	11	11	11	11	11	11
Jones	10	10	10	10	10	10	10	10	10	10	10
F. Coleman	10	10	10	10	10	10	10	10	10	10	10

Catchpole Gun Club.

WOLCOTT, N. Y., March 30.—Herewith are the scores made at a tournament held by the Catchpole Gun Club, March 30. The programme consisted of twelve events, a total of 145 targets. There was a good attendance, several well-known shots from Rochester, Fulton, Sodas and Sterling being present.

Targets were thrown from the magatrap. Event 10 was at 5 pairs and 10 singles:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	Shot.
Targets:	10	10	10	10	10	10	10	10	10	10	10	10	145
C. Doyile	8	6	7	10	6	5	12	7	13	8	10	145	97
Dr. Weller	8	9	10	13	7	8	7	11	9	18	9	145	120
Beyer	10	9	9	12	8	9	9	13	9	17	10	145	130
R. Doyile	7	8	7	11	6	6	10	10	10	10	10	75	52
Cosad	6	7	8	13	6	7	12	13	13	13	13	90	65
Wride	10	10	7	15	8	8	13	8	16	9	10	130	107

E. A. WADSWORTH, Sec'y.

St. Louis Shooting Association.

NEW YORK, April 1.—Editor *Forest and Stream*: As you have already announced to your readers, the E. C. cup, emblematic of the inanimate target championship of the world, will be contested for in open competition at the Missouri State shoot, to be held at St. Louis, May, 16-20, under the auspices of the St. Louis Shooting Association.

When the St. Louis Shooting Association first requested the American E. C. & Schultze Gun Powder Co. to place this cup in open competition at its tournament, the secretary of the Association, Mr. H. B. Collins, asked me, in the event of the above company favorably considering the request, to forward to him a couple of photographs of the cup. The other day I mailed him the photographs, and received his acknowledgment through the courtesy of Mr. Herbert Taylor in the following letter, which I take to be of sufficient interest to the shooting public to find space in your publication: (The letter is dated St. Louis, March 27.)

"I beg to acknowledge the receipt of your recent favor; also two photographs of the cup. The photographs have excited unusual interest among the sportsmen who have seen them, and have been of material assistance to us in the way of preparing a design for a beautiful cup, which has been given to this Association by the St. Louis Republic.

"I do not intend to convey the idea that the design has been copied in the slightest detail, as this new cup is a loving cup, with a picture of a trap-shooter at the score in half relief. The cost of the cup will be between \$700 and \$800, and will be emblematic of St. Louis' open for all contest at live birds. The conditions have not been definitely settled, but they will probably follow the rules governing the Kansas City Star cup, which, as you know, is now the property of Mr. J. A. R. Elliott, and no longer subject to competition.

"We are out of the woods now in regard to our tournament; ample money is assured; programme mapped out and adopted, and arrangement of grounds completed. We have now to execute the mechanical work, and will open up on May 15 the best and largest tournament ever held in the country, given by amateurs for amateurs, and for the love of the sport. Not barring any class of men, yet making it possible for the 80 per cent. plan to shoot through the programme.

"We seek to attain these results by adopting the Rose system of division of moneys, and making the man who can only break 11 out of 15 or 15 out of 20 transact a little business with the cashier at the end of the day. It is one of the pleasant features of a tournament, that little interview with the man in the box office. When you say 'Please settle up with me,' and when you stick that money down in your jeans, it comes as near warming the cockles of the amateur's heart as anything in the world.

"We are going to try and make it pleasant for most everybody except the 95 per cent. man. He will have to be content with modest winnings as compared with the old times, when little amateur tournaments paid one or two shooters \$100 or \$200 per day, and when everybody else was loser.

"A man at our tournaments if he shoots like a house afire can make money; an average shot will more than pay his expenses, and the man that plays in hard luck cannot lose very much.

"The Association adds a large amount of money. Just think of it! \$30 added to the 15-bird events, and \$35 to the 20-bird events. Think how many targets that will buy! And we take out only 2 cents for targets! It's a losing proposition on the face of it for the Association. We do not have the support that has been given to tournaments in the past by manufacturers.

"Let me add in conclusion that if any tournament is deserving of a large attendance this one surely is. If any plan for running a tournament will bring the amateur from his hiding place, and put the sport on a proper basis, we believe that we have found the right way to do it.

"The few evils which have crept into the sport we have tried to eliminate, and if we do not succeed in making this tournament in May at St. Louis the best one from all points of view that was ever given, why, we just don't know how."

The above letter from Mr. Taylor speaks for itself, and shows how hard the St. Louis Shooting Association is working to make its tournament a success.

EDWARD BANKS.

Boston Gun Club.

WELLINGTON, Mass., March 31.—The Boston Gun Club held its final shoot in first '99 series Wednesday, March 29, and the most noticeable feature of the afternoon was a gale of wind that beat the record for velocity and general depravity. The little coterie of shooters aboard the usual train were partially prepared for an interesting seance with the targets upon viewing the white-caps and rolling billows of the adjacent river from car windows, and later, while shooting, the surf could easily be seen dashing high on the banks of the same stream, as it narrowly winds in front of the club house some 500 yds. away. It was truly a picnic, and the kind of a picnic where nobody improved on former scores, and all but the 21 yds. shooter succumbed to the inevitable and would prefer the scores not to be printed. Either Mr. Leroy's load had a knack of reaching the right place at the right instant or he just fooled the targets by smashing them so quickly that the breeze was beaten at its own game.

His quick execution was very noticeable, and once or twice it was found necessary to remind him that it would be just as well to allow the target a slight start.

The prize winners and scores are given at the conclusion of this report. Mr. Woodruff is now the fortunate possessor of a B. G. C. watch charm, just beating out Gordon and Miskay by one target. The scores are not so high as in previous series, principally because of so many stormy Wednesdays. One week was missed entirely on account of it being impossible to shoot; this narrowed the fourteen shoots to thirteen, and of these six best scores were selected for prize total. The five best scores counted for the two, or, rather, four team prizes. Regardless of the weather, the shoots have been well attended, and a great deal of pleasure and practice derived from the afternoon meetings. The new series will cover the months between now and shore bird season; and, given more favorable shooting conditions, the scores should show much improvement.

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	10	10	10	10	10	10	10	10	10	10	10	10
Gordon, 17.	5	8	1	5	4	2	10	3	7	4	5	5

TERMS: \$4 A YEAR. 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, APRIL 15, 1899.

VOL. III. No. 15.
No. 246 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

We commonly refrain from killing swallows, and esteem it unlucky to destroy them: whether herein there be not a Pagan relic, we have some reason to doubt. For we read in Aelion that these birds were sacred unto the Penates or household gods of the ancients, and therefore were preserved. The same they also honored as the unncios of the spring; and we find in Athenalus that the Rhodions had a solemn song to welcome in the swallow.
Sir Thomas Browne.

NOTICE.

THE New York Clearing House has adopted new regulations governing the collection of checks and drafts on banks outside of the city. This entails a collection expense on those who receive such checks. Our patrons are requested, therefore, in making their remittances to send postal or express money order, postage stamps, or check or draft on a New York city bank, or other New York current funds.

MOUNDS AND ANIMAL EFFIGIES.

IN his interesting work on the mounds and earthwork of the Mississippi Valley, the second volume of the Pre-historic America, Mr. Stephen D. Peet, gives a vast amount of interesting material, which he considers as bearing directly on the hunting methods of the ancient people who occupied the region where they constructed those gigantic earthworks, which have so long been the wonder of all students of American ethnology. The primitive American was largely a flesh eater, and almost all the old-time tribes of this continent were hunters and depended in large measure on the animal food which they captured in various ways.

These people, as is well understood, were poorly armed, and to be successful it was necessary that they should creep close to the animal which they wished to destroy and should shoot at it, perhaps over and over again, with the stone headed arrow. Among all tribes traditions are handed down telling of the danger to man in primitive days from the animals on which in our time he subsisted, and telling too how in ancient times the moose, the deer, the antelope and the buffalo did not serve as food for the people, but instead devoured the people as their food. Father Marquette, the noble missionary who was the first to voyage on the waters of the upper Mississippi says: "The Indians hide themselves when they shoot at them (the buffalo), otherwise they would be in great danger of losing their lives. They follow them at a great distance, but for loss of blood they are unable to follow them. They graze upon the banks of the rivers."

Many of these earthworks so carefully studied by Mr. Peet consist of ridges built either parallel or converging, and often near some steep high bluff. The author believes that it was the practice to drive the game into such narrow passageways and so to get near to them and to slaughter them with the primitive weapons; and while this may have been often the case, it is also probably true that in other instances these passageways led to pens and corrals into which the game was driven and in which it might be confined while the operations of slaughtering it went forward. These ancient hunters were, of course, as familiar with the ways and the habits of the animals on which they fed as our modern Indians have been. They knew all their haunts and runways, and understood precisely how a herd of animals of any sort would act under a given set of conditions. They knew, for example, precisely where they would find a certain sort of game at any particular season of the year, and when their crops had been gathered in the late summer, they traveled to their hunting grounds, where they found the game fat and abundant.

Mr. Peet has pointed out that the country where these mounds are found was in these ancient times a real paradise for the hunter, for game was enormously abundant; not only elk, deer, buffalo, moose, and all kinds of birds,

but also the carnivores, bear, wolf, panther, fox and lynx. It is not difficult to believe this, and indeed authors who wrote of it in colonial times, picture the Mississippi Valley as abounding in game. Mr. Peet believes many of the animals whose figures he sees represented in these mounds to be in fact effigies of certain animal gods which had the power to assist the hunter in his chase, and that these mounds are analogous to the pictured figures which used to be found on bluffs and in caves. In other words, he looks on them as bearing to the mound builders a relation somewhat similar to the pictures of saints and angels with which we adorn our churches.

If, as Dr. Peet believes, these mounds possessing animal shapes are indeed game gods or gods of the chase, they might well enough be situated near to the drives where the chase was carried on. They would thus be more constantly in the sight of the people and more convenient to be addressed in prayer. Also, they might more readily be dreamed of if they were where they were easily and often seen.

It must be acknowledged that the question as to who built these mounds and why they built them have not yet been satisfactorily answered. The probabilities all seem to indicate that the mound builders were no more than the predecessors, and probably the progenitors of the Indians found in the country when the white man came.

SNAP SHOTS.

In the April session of the Rhode Island Legislature Hon. N. F. Reiner will introduce a measure to provide a game commission for the State, and to shorten the open season so that it shall be for all game birds Oct. 15 to Dec. 15. In view of the decrease of game, due in large measure to snaring for the market, there is urgent necessity of amending the statute, which now permits owners to snare on their own land. This is virtually giving license to all snarers, for experience has proved the difficulty of suppressing the industry of snaring by professional market hunters on the farms of others, so long as any snaring is permitted. As so many of the members of the General Assembly are in sympathy with the snaring element, any change in the present law would be difficult of achievement; but we are advised that Senator Reiner will make the attempt to abolish snaring; and if the sportsmen of the State will lend their assistance the end may be accomplished. The practical way to work is for each sportsman who is interested to see his Senator or Representative and secure his support of the measure. Now that they are assured of representation by one who appreciates the situation so thoroughly as does Mr. Reiner, the citizens of Rhode Island should improve the opportunity to correct this long-standing abuse.

We print to-day the first part of Mr. Harry E. Lee's story of his hunting experiences in Alaska. The concluding portion will be given next week, and will relate to the moose and caribou country. Mr. Lee is now planning another trip to Alaska, this time going in quest of the musk-ox, the wood bison and the bear.

It gives us pleasure to correct a misapprehension or a slip of the pen by Mr. Fred Mather in his notes last week, when he spoke of the late Theodore Morford; for Mr. Morford is living at his New Jersey home, and is in no sense late. Mr. Rowland E. Robinson asks after the veteran poet-sportsman, Isaac McLellan; and a wide circle will be pleased to learn that Mr. McLellan is living, still hale and hearty, in his ninety-third year, at Greenport, Long Island. By the way, we wonder if the school children of to-day number among the bits of verse made familiar by their school readers, Mr. McLellan's poem, so well known and so often declaimed by the boys of long ago:

Wild was the night, yet a wilder night
Hung 'round the soldier's pillow;
In his bosom there waged a fiercer fight
Than the fight on the wrathful billow.

Here once more is the old question of the apprentices who made it a condition of their articles of indenture that they should not be required to eat salmon or shad or canvasback duck more than six days in the week; and we are asked for references to the documents in the case as applying to the shad of the Connecticut River. We cannot give any light on the subject. No authentic data have ever been discovered, though in past years

we have not infrequently requested those who made reference to such stipulations to show the papers. The myth, if myth it be, is an ancient one. Here is a paragraph bearing on it from the autobiography of the artist Thomas Bewick, more than a hundred years ago: "From about the year 1760 to '67, when a boy, I was frequently sent by my parents to purchase a salmon from the fishers of the 'strike' at Eltringham Ford. At that time, I never paid more, and often less, than three half-pence per pound (mostly a heavy, guessed weight, about which they were not exact). Before, or perhaps about this time, there had always been an article inserted in every indenture in Newcastle that the apprentice was not to be obliged to eat salmon above twice a week, and this like bargain was made upon hiring ordinary servants."

The story of an Adirondack moose hunt, as told in our pages the other day by Mr. Peter Flint, has attracted much deserved attention in the northern part of the State, where the moose is now but a memory with some of the oldest inhabitants. Another interesting occurrence in the history of the moose in its old stamping grounds was referred to in a note last week from Commissioner Jno. W. Titcomb, of Vermont, recording the killing of a moose near Island Pond, in that State. This was probably the first moose killed in Vermont for twenty-five or thirty years; at least it is the first during that period made known to the public. Mr. Titcomb sends us a photograph of the unlovely head with its ridiculous spike-horns.

This Vermont moose incident gives admirable point to the plea which our Mississippi contributor, Coahoma, makes for immunity in behalf of the stray remnants of peirshing species. Let such a creature show its head, as did this moose, in a region where it is a rarity, and as certain as fate the human kind will set upon it to do it to death. An entire village, men, boys and women with children in arms will join in the pursuit of a chance doe or fawn. Let a pestiferous bird "collector" catch sight of the bright plumage of a rare bird, and he is on the instant aroused to destroy it in the name of what he calls science.

We congratulate Mr. D. C. Beaman, of Denver, and those who have labored with him to secure the enactment of the game bill to which we have already devoted attention in these columns. In its original form the measure provided for a hunting and guiding license, but this feature was eliminated in the discussion. Another change made was respecting the limitation of the bag; Mr. Beaman's draft put the limit of ducks lawfully killed in a day at twenty-five, and the number in possession at fifty, but these numbers were raised to fifty and one hundred respectively, and a lawful fifty pounds of fish was made seventy-five pounds. The old provision is retained that game may be killed for food purposes only, and a decided step in advance is a further limitation of the individual to one elk, one antelope and one deer (or instead of one antelope and one deer, two of either) in a season. When it is remembered that the mountain ranchmen of Colorado have been accustomed to kill these species by the cord pile of stacked carcasses, the effect of the new rule may be realized. That effect, of course, depends upon how the new statute shall be enforced. For the executive service, there have been provided a commissioner, five chief wardens constantly in service, and ten deputies when required. If the people of Colorado will give the new game protective system a fair trial, we are convinced that the results of the test will be to establish the system in the support of public opinion.

The sportsmen of Illinois are bestirring themselves to prevent the passage through the Legislature of Senate Bill number 43, an act to amend the game law. In its original form Bill 43 was a vicious measure clearly framed in the interest of the game dealers of Chicago, who, if the bill should become a law, would have an open market for venison and grouse.

Dr. Tarleton H. Bean has been appointed to the charge of the Fisheries Department of the American exhibit at Paris in 1900. The appointment is an excellent one; Dr. Bean has had extended experience in this field, and under his direction the United States display at Paris will be a creditable showing of our fishery resources, appliances and methods.

The Sportsman Tourist.

Winning Alaska Trophies.—I.

I AM receiving numerous letters from all parts of the country wishing to know more about my hunting trip of 1898 in Alaska, and as it is impossible to answer all of them, I know of no better way than to just give you a short detailed account of it.

I left Chicago about May 5 and visited friends in nearly every State between there and the Coast, arriving at Seattle June 10. I expected to get a boat at once for Cook's Inlet, but was disappointed, as the mail steamer only leaves once a month for that part of Alaska. I met my friend, Mr. Dall De Neese, of Cañon City, Colo., at Salt Lake, and found him a most enjoyable companion all the way up to Alaska. While waiting for our boat to leave we enjoyed ourselves in going up to Cedar Lake, Wash., and had some fine sport with speckled trout. We also visited a number of places of interest around Seattle and Tacoma.

Our steamer left Seattle June 28, and we had a most delightful trip all the way up. We stopped at Fort Wrangell, Juneau, Skagway, Sitka and other points of interest. It was quite an interesting study to watch the miners and prospectors at each of the steamboat landings, and note the expression on each face. Some were returning after months of toil and hardship without a penny in their pocket nor the slightest prospect for the future. Others were just starting out, their faces all aglow and radiant with hope and confidence. It is surprising to see how many people go up to Alaska and how few there are who know the resources of that wonderful country. Thousands of people go over the trail or around by the Yukon to Dawson City, and hardly one of them ever attempts to penetrate the interior. I had some of the latest Government maps along with me, and was astonished to find that not one of them was correct. I made some special inquiries into this matter, and found that most of the maps were made from supposition, and others from descriptions given by Indians, but none from real observation, for no one had yet penetrated that country. Every little town along the Coast was crowded with prospectors. And such prospectors! Nine-tenths of them acted more like children at a seaside watering place with their little pick and shovel, digging in the dry sand; each one of course expected to find nuggets in every shovelful of sand; but as they did not find the yellow metal as expected they would get together and discuss the situation and then blame the whole country. There are a few men in that country who are not afraid to stem the fierce tides or cross the rugged mountains, and those are the men who will succeed.

The Indians along the Cook's Inlet country are quite different from those in the eastern part of Alaska. I found the eastern Indians between Seattle and Sitka a very lazy, slovenly class, while those further west were much brighter and possessed far more intelligence. Nearly all have neat, comfortable little homes; all spoke the Russian language, and nearly all belong to the Russian Greek Church. I never found a more honest class of people in any part of the country than those western Alaskan Indians. They never think of touching anything that does not belong to them. I left my camp for weeks at a time where Indians passed every day, and not one article was ever molested.

Our first landing place in western Alaska was at Homer, a large mining camp on Kachemmach Bay. From there we took a small steamer which carries mail and passengers up Cook's Inlet. We stopped off at Kussilof, and through the courtesy of Capt. Weatherby were made very comfortable. At this point is located one of the largest salmon canneries on the western coast. Capt. Weatherby is in charge of it, and is a most worthy gentleman in every respect. From this point we took a small sail-boat and visited all of the towns along the coast on both sides of the inlet. It required about ten days to make the trip, as the boat was small and the water very rough. On our return to Kussilof I parted company with Mr. De Neese. He went up the Kussilof River on a prospecting trip, while I returned to Homer, where I made my permanent headquarters. Homer is situated on what is known as the Spit, a peninsula running out in the Kachemmach Bay, about five miles long and only half a mile wide. It is the only place in Alaska which I found entirely free from mosquitoes and insects of all kinds during the summer months. The shores are teeming with waterfowl of every description. The eider duck especially are very numerous, and a great number of other varieties that I had never seen nor heard of before. Wild geese are also very plentiful. Most of the ducks which are raised in this part of the country winter on the west shore of Japan instead of in the United States. The waters are alive with nearly every variety of fish. The silver salmon is the gamiest fish I saw in that part of the country. I have seen those great shining beauties of 10, 15 and 20 lbs. rise to a fly, and maybe you think I did not have fun landing them.

While enjoying these sports along the coast of the Kachemmach, I would gaze away off in the distance to the far off snowy range of mountains, and with my mind's eye could see the great white-fleeced bighorn sheep I had heard so much about, but according to the miners and prospectors and even the Indians, no human being could ever ascend the rugged peaks or cross the deadly glaciers. I had come several thousand miles for this purpose, however, and to see the promised land and not get there was hardly my style of doing things. I tried to engage some Indians, but they all said, "Water too plenty; mountains no good walk"; or in other words, the rivers were too rapid and the mountains too hard to climb; and none of them cared to endanger their precious life, for as a rule they never like to take any risk unless it is absolutely necessary. While debating what was the best plan to pursue, I met with some gentlemen who were anxious to take a little pleasure trip up the bay, and four of us started for the mouth of Sheep River. I thought that if I got up so far as that I would try the ascent of the mountains alone and risk all dangers in order to get one of the much coveted sheep.

Our party consisted of Mr. L. M. Morgan, of Illinois; Mr. Harry Gunning, of Brooklyn, N. Y.; A. J. Hill, of

Paterson, N. J., and myself. Our craft was a whaleboat rigged with sails and having a cabin large enough for four to sleep comfortably in. We reached our destination in three days and found a very pleasant place to camp, which I named Windy Point, as the wind caused from the action of the glaciers blows there continually. You may think it strange for me to call this a pleasant place to camp; but if you knew how much more pleasant it is to endure a little wind, even if it is off a glacier, than to be eaten alive with mosquitoes and sand flies, you would agree with me that it was enjoyable. Mr. Morgan and Mr. Hill were both anxious to see a mountain sheep, and decided to accompany me on my mountain climb. We baked bread sufficient for a four days' trip, and with very scant outfit started. Our route was through a deep swamp, and at every step we went over our knees and very often to our hips in mud and water. This continued for miles and miles, until we thought we could never reach firm footing again, nor even a spot where we could rest for a moment; however, we toiled on until we reached the foot of the mountain, and here our hardships begun in earnest.

I have hunted through the dense forests in upper Canada, the Cumberland Mountains in Pennsylvania, the Ozark Mountains in Arkansas, the Rocky Mountains in Colorado, Wyoming and Montana, the swamps and canebrakes of Mississippi and Louisiana, and the hummocks and Everglades of Florida, but in all my experience I never undertook anything half so bad as this was. My two companions decided to give up and return to camp, as it seemed impossible to go one step further. The underbrush was so dense and matted and the "devil's staff" so plentiful that a rabbit could hardly crawl through. The "devil's staff" is a growth of underbrush averaging about 1 in. in diameter and about 3 or 4 ft. high, and it is ten times worse than briars, for the thorns are long and sharp as a sword and very poisonous. Then the rocks were so perpendicular that we had to climb up on each others' shoulders to get over them. I finally persuaded my companions to keep going, and we would get to the

DALL'S MOUNTAIN SHEEP.

One of the specimens secured by Mr. Lee.

top some time, and by 10 o'clock that night we reached timber line. Here we made a shelter of spruce boughs and rested for the night.

The next morning we found that we were only about half way up the mountain. Each of us had a repeating rifle. Mr. Morgan had a .45-90 Winchester, Mr. Hill had my .30-40 Winchester, and I staked my faith on my little .30-30 Savage. At an early hour we started for the summit of the mountains, and about noon reached the top. We saw several signs of sheep along the ledge, but the animals themselves were nowhere to be seen. At last we looked away across a deep ravine, and saw on a distant mountain four little white specks; we hardly knew whether they were sheep or snow; but finally we could discern that the objects moved, and we were satisfied that they were the long-expected animals we were hunting. Now for the wings of an eagle or some other bird to waft us over that dreadful deep ravine. We looked down and saw the bottom about 3,000 ft. below, and the rocky cliff on each side almost perpendicular. There was no alternative, however; down the rocky ledge we had to go, and inch by inch crawled up the other side. One unguarded step would mark our destiny forever. Finally we reached the opposite mountain and saw the sheep about a mile above us. We were almost exhausted, as we had had nothing to eat from early morn, and the light atmosphere was anything but reviving. It was, indeed, almost impossible to breathe.

Now was the time for the hunter to exert his skill as well as his strength. The mountain sheep are considered wildest of all animals to get within range, and especially at this season of the year, when everything is in their favor. Their great large eyes are always on the lookout and their keen ears are ever on the alert for the slightest sound; their nose is in the air most of the time, and so acute is their sense of smell that it is said they can easily scent danger a mile away; and from my own experience I am satisfied that the statement is correct. I also found that hunting the Alaskan sheep was quite a different proposition from that with those found in the Rocky Mountains. The Rocky Mountain sheep are used to seeing numerous animals, such as deer, elk and antelope, around them every day, which has a tendency to make them less suspicious. The Alaskan sheep sees nothing on those bare mountains but animals which they are in constant dread of, such as bear, wolves and mountain lions. It is therefore reasonable to suppose that they are more watchful and more apprehensive of all moving objects. Our first care was to see from which point the wind was blowing; our next was to keep out of sight, and last, but not least, to be very cautious not to make the slightest noise. Neither of the men along with me seemed to realize how important all of these precautions were, and I had hard work to keep them from making some serious blunders.

The first difficulty was to get above the sheep. To do this we had to make a detour of about three miles. The sheep were disporting themselves in a little valley and

acted more like lambkins than the great, old full-grown males that they were. The females were carefully concealed along the deep ledges of the precipice, guarding their little ones, while their lords and masters were out enjoying the sunshine, and all the pleasures of their mountain life.

We now separated, Mr. Morgan going to a ledge of rock almost over the sheep; Mr. Hill was to go around the hill and cut off their retreat, while I remained behind some rocks about 600 yds. from the sheep. As soon as Mr. Morgan reached the point of rock, which was about 85 yds. from the game, he immediately began firing at them. Naturally, of course, the sheep were surprised, and instead of running direct to the ledges they bunched and looked in every direction to see where all the noise was coming from. Finally, after Mr. Morgan had discharged about eight shots without touching a hair he raised his head and the sheep bolted around the hill and came within 400 yds. of the rocks where I was concealed. I knew it was a long shot and a hard one, as scared sheep do not give a very easy mark, even at close range, but it was my only chance, and with well-directed aim I drew down on the neck of the foremost one, and the ball went crashing through the shoulder. The animal fell at the report of the gun and the others ran around to where Mr. Hill was standing. He shot seven times, but without effect. Mr. Morgan ran down the hill and saw the sheep as it fell, and as he did not see either of us shoot, he supposed he had killed the sheep, and that it had run that far and fallen. I enjoyed his zest and enthusiasm for some time. I never saw a man feel so elated in my life. He danced around and threw up his hat and acted like a boy when he catches his first fish. I was so pleased at his intense pleasure that I decided not to mention that I had killed the animal, for I knew I could easily get another next day. But when he and Mr. Hill began to examine the bullet hole, they discovered that it was a small bullet that had done the work, and as Mr. Morgan was using a .45-90 the fact began to dawn upon them that the shot must have come from some other gun. He looked at me and asked if I had shot at the sheep from such a distance. I said I had taken a random shot; but as he was so close he certainly must have hit some of them. No more was said on this matter, and Mr. Morgan skinned the prize and took the head as a royal trophy. We took the meat and set out to our mountain camp, which was about seven miles from where the sheep was killed.

We reached camp a little before dark, tired, wet and hungry, but soon a big fire of spruce logs was crackling and roaring. Water was brought from the stream a few rods distant, and some coffee was put on. Long green sticks were cut with three prongs on each one, and the choicest part of the fine mutton was broiled, while the spare-ribs were put on strong skewers to broil for later use. It made a great feast. I am sure we ate for three hours, and when we rolled in on our spruce boughs for the night we felt as though we were just as near content as it was possible for mortal man to get. We were hunting mountain sheep all night in our dreams and saw some wonderfully fine specimens.

Next morning, waking bright and early, we decided that Mr. Morgan should take his trophy and the two hind-quarters and go down to our lower camp, which was about twenty miles down the mountain, while Mr. Hill and I should return to the summit and go up on some very high peaks, where I was satisfied there were some monster old rams.

It is an easy matter to talk about it, or read about it, but when it comes to climbing along the edge of precipices thousands of feet deep, where every movement of hand or foot means life or death, and crossing over snowslides, glaciers and peaks perpetually crowned with snow, it is quite a different thing. And it is especially hard when the thermometer is down, down—well, I don't want to say how far down it does go on those mountains; but it got so intensely cold and dangerous that my man could not endure it any longer and had to return to camp; yet he had been raised on the borders of northern Russia and was a fine specimen of sturdy manhood. He tried to prevail on me to return, as he said it was impossible for any one to cross a large glacier which was in front of us and which must be crossed to get to the mountain that I saw in the distance. This glacier was about three miles wide, with chasms and fissures all through it hundreds of feet deep, and so narrow and perpendicular that they could not be seen until one came within a few feet of them. I crossed one which was about 2 ft. wide. I could not see the bottom of it, but could hear the water roaring down some thousands of feet below. I was afraid to step across this death hole with my boots on, as the soles were getting very slippery, and a slip of even 1 in. meant sure death. So I sat down and pulled off my boots and put on an extra pair of heavy stockings, which I carried in my pocket, and digging a rough place in the ice, with the butt of my rifle I had a firm place to step from; but the other side was like a sea of glass, and if I should fall I would have nothing to hold on to, and where I should stop it was impossible to tell. Finally I made the spring and landed safely and squarely on both feet; I jammed the butt of the little rifle into the ice to steady myself. I now had about two miles to go in my stocking feet, but strange to say my feet did not get cold.

When I was within 600 yds. of the opposite side I heard a terrible roaring, but could not locate where the noise came from. I knew it was the noise of falling water; but there was no place visible for such a roaring torrent. At times the sound seemed to come from above, then from one side, and then from another. I then thought that the glacier was splitting open, but as I proceeded I came to the conclusion that it was a river running under the ice. I could not tell how close it was to the surface, and I had to be very careful where I stepped; for it very frequently happens that the ice over those rivers is only a few inches thick, and once the ice is broken it means a plunge of hundreds and perhaps thousands of feet into a watery grave. I continued cautiously until the rough shore was reached, and although it looked rough and uninviting, it was the happiest moment of my life when I felt my feet touch the solid rocks. I sat down for a while to rest, and how I wished I was back across that sea of ice; but my time was limited to a few hours, and I had to make good use of every moment and

had no time to reflect on danger past or danger ahead. At once I climbed up the steep rocks, and to my intense joy I began to see large footprints of sheep on every hand and noticed particularly the size of them. When I reached the summit I saw, about half a mile distant, on a projecting ledge, three large sheep. I dropped to my knees, and as the wind was in my favor, crawled within 200 yds of the game. I examined them carefully with the field glass and noticed that one of them was a monarch of the mountains. I raised my rifle very carefully and took deliberate aim. Sping, went the little Savage, and the great monster fell where he stood. The others at one bound were out of sight, and I was glad they were, as I had all I could attend to.

I worked for about two hours getting the hide and head carefully taken off, and when I got through it was almost night. A thick fog began to settle all over the mountain. I knew it was useless to try and return to camp that night, and so began at once to look for a sheltered spot, as the wind began to blow from the north-west, and with it came a cold, drizzling rain. My feet were already wet from walking over the glacier, and as I had no coat with me my buckskin shirt soon got wet through and the ground was very damp and cold. You probably ask why I did not make a fire. There was neither wood nor brush within twenty miles, and hardly a blade of grass. I had half a hardtack in my pocket and a small piece of raw fat bacon, which I devoured with relish. I now stretched the sheep skin and made a pillow of the head; and it was a little better than a rock. Not expecting anything to disturb me until morning, I closed my eyes and tried to sleep; but the chilly wind and the rain coming thicker and faster, I did not get to sleep for over an hour. About 1 o'clock I was roused by a strange noise close by, and raising up on my elbow I looked in the direction the sound came from, and to my surprise saw on the edge of the rock where I had left the carcass of the sheep two large brown bears, which were fighting over the meat. I thought I would keep quiet and let them have it out. I also knew that if they got filled with the mutton they would not be so likely to bother me, and under the circumstances I did not care to have any closer relations with them just at present; but I did not sleep any more, for it was hard to tell how many other bears there were in that part of the country, and the smell of the fresh meat would attract them from a long way. I examined my little rifle very carefully and saw that it was well supplied with soft-nose cartridges. I also looked at the edge of my hunting knife and rubbed it a few times on the sole of my shoe. I did not want to be the attacking party, but if attacked I should certainly make the best of what I had. The bears kept on growling and eating until they had consumed nearly the whole sheep, and then slunk off along the ledges without even paying me a visit or thanking me for their supper.

It was now breaking day and I had a long, hard walk before me and a heavy load to carry. I got up and stretched myself, and, strange to say, did not feel tired, stiff or hungry. But I was wet to the skin from head to foot. I took a small rope and tied the head and hide of the sheep together, and throwing it over my shoulder started down to the glacier. There was quite a stiff breeze blowing, and I again took off my boots and started across, holding boots in one hand and with the other using the rifle as an Alpine staff. The sharp steel-pointed butt-plate was just the thing, and had it not been for this rifle I never could have gotten across that day, for the wind got higher and higher, until I was compelled to lie down flat on the ice at times; and when I did get across I was almost exhausted. I had now about fourteen miles to camp over a rough and dangerous mountain, and not having had anything to eat for almost two days, I felt a little weak; but I kept right on, and about 4 o'clock in the afternoon got sight of camp. My man soon had a good fire and plenty of meat and coffee ready. He was nearly wild with delight when he saw me, for he had given me up for dead. He examined the bighorn and the faultless white skin, and now regretted that he had not gone with me. I told him I had seen some others on this side of the glacier and I thought we would go back in the morning and get one for him. I dried my clothes and rested that night.

The next morning we were up at daylight and drank a cup of coffee and ate a piece of broiled mutton, and were ready for another day's hard journey. We sighted the sheep about a mile from the place I had seen them the day before. When we got within half a mile of them I made him take off his black hat and black sweater and his heavy boots. This seemed very hard to him, but it was necessary in order to get our game. The sheep were feeding on the edge of a precipice, and we had to steal cautiously to a ledge of rock and then shoot over the embankment. When we got to the desired spot the sheep were feeding about 100 yds down the slope. There were three of them. I told my companion to take the one to the right and I would take the one on the left; he cocked his gun and got up when I did. As we rose the sheep scented us and off they started, two to the left and one to the right. I could only see them as they bounded in the air, but at each crack of the little Savage a sheep fell. I now looked to my right and saw the other one getting away as fast as possible. I leveled my gun on him and he went down. All this time my friend stood perfectly motionless with his mouth open. I asked him why he did not shoot; he said he did not think of it until they were all gone. Then he raised his gun and shot at the one to his right, which was already down. I told him it was no use to shoot at it, as it was already done for, but he was so bewildered he hardly knew what he was doing. We then walked over to the edge of the slope, but could only see one sheep, though we knew that two had come down. On close examination we found that one of them had rolled over the embankment and gone down a precipice about 2,000 ft. The other one was only saved by his massive horns, which struck the ground first and held him. It was a very dangerous thing to go near him, as the slope was at an angle of over 45 degrees, and the precipice was only a few feet below where he had fallen. I worked my down to where he was and tied a rope around his foot, as he was liable at any moment to roll over. I did not care to lose such a magnificent head. I had my little camera along and took a snap shot of him as he lay with his head bent

under him. We propped him up with rocks as best we could and I held to his foot while Mr. Hill got him skinned. We then got the other head, which was over on the right, and with as much meat as we could carry we started for camp. On our way home we saw several ewes and lambs, but did not disturb them.

It was now 9 o'clock, and we had seven miles to go. Our way was around the edge of a deep ravine for about two miles; then we had to go down the steep ledges to the bottom, and from there work our way down through tangled underbrush and deep holes of unknown depths. The fog and rain came down thick and fast, and the wind blew a stiff breeze from the west. We were both tired and almost worn out. We heard a peculiar cry coming from the opposite side of the ravine. I first thought it was a mountain lion, but my Russian friend said not, but that he had heard the same cry a number of times before in northern Russia, and it was that of the black Siberian wolf. He hesitated about going down the ravine. I tried to cheer him up, telling him that they were cowardly animals. But this did not go. He knew what they were and would not go a step further. The cries began to be a little more numerous and much sharper than when we first heard them. We wind was blowing direct from us to them, and we soon began to realize that we were the object of their pursuit. The smell of the fresh meat was what first attracted their attention. We now had either to leave the meat and heads and run for our lives, or else prepare for war. I preferred the latter, as I wanted to get a few of their hides anyway; but my Russian friend did not care to meet them. We could hear them coming down the opposite side of the cañon, and the rattling of loose rocks which gave way from under their feet, mingled with their fierce cries, made the blood curdle in every vein. The night was growing darker every moment, and there was no possible chance for retreat, for the mountain back of us was a solid mass of ice and snow. I demanded that we go right down the ledges into the cañon and meet our enemy face to face, for I was satisfied I could attend to them as fast as they came in view. I kept about ten steps ahead of my man, and on reaching the bottom I looked a little ahead and saw on a large flat rock the form of some animal. I did not say anything until I got within ten steps of it. Then, when I saw it crouch as if preparing for a spring, I raised the rifle and took a random shot, and at the report the animal fell with a heavy thud on the opposite side of the rock. The wolves also stopped their cries for a few moments, and instead of waiting to examine what kind of a beast I had shot we moved rapidly on, as fast as our tired limbs could carry us. I now prepared myself for the worst, as I expected every moment that the black demons would be upon us. Presently we heard some fierce snapping and growling a few hundred yards behind us. Pausing for a moment we could distinctly hear their wicked jaws coming together. The way was now over open ground, and the camp was about three miles distant. The moss and underbrush made it very disagreeable walking, and the rushing streams which came down from the glaciers were not very inviting to wade through; some of them were knee deep and others nearly up to our waists. If you have never taken a bath in ice water you cannot imagine how intensely cold those streams are. The noise of our pursuers was soon left behind. Yet we did not know when they might come stealthily upon us, and our ears were ever on the alert.

The next trouble that confronted us was to find our camp, for it was now dark, and there was no road nor object to mark the location. The camp itself consisted only of a few stunted spruce trees, with some brush thrown over them. My man insisted that it was in one direction, while I contended it was in another. Fellow sportsmen who have lost their way at night know what this means. Again I had to take the command, and after an hour's hard walking we discovered the little clump of trees. It was now about 12 o'clock, and we were quickly stretched along the fire and fast asleep, with wet clothes on. We did not care now for wet clothes, cold winds, wolves, bears, nor anything else. Sleep and rest were what we must have, and we put in ten solid hours before we awoke.

The sun was up several hours high and the spruce logs had long since smoldered into ashes. The day was warm and cloudless (something rare in this part of the country). We ate a good breakfast of broiled mutton, and while my man attended to some camp duties I shouldered my rifle and walked up the ravine where I had shot the animal which the wolves had stopped to devour. On arriving there a strange sight met the eye. The fresh bones of at least half a dozen animals were scattered all around, and the earth was torn up as if a desperate struggle had taken place. Every particle of meat was devoured, and only occasionally a tuft of hair was scattered on the blood-stained ground. I examined the hair carefully and found that some of it was that of a wolverine, and it was this animal that had been crouching on the rock when I shot. I followed up the track of the wolves, and as near as I could count in the wet sand there must have been about eight or ten still left. I kept eyes and ears open, expecting every moment to see some of the slinking creatures, for I did not think they would go very far from where they had had such a ravenous feast. They soon took to the ledges and I could not track them any further. I now thought they must have gone back the way they had come, and accordingly climbed up that side of the ravine. I was quite tired when I got to the top and sat down on a large boulder to examine the surrounding country.

I could not see a living creature in any direction. I sat there for about half an hour, and was contemplating a return to camp, when I heard on the opposite side of the cañon a number of sharp, quick barks or yelps. I looked in the direction of the sound, but could not see a thing. Presently I discovered two sheep coming down the mountain, and about 10 yds behind them five wolves. The pursuers seemed to be gaining on their prey when they reached the cliffs; but the sheep plunged down, down, until they reached a wide shelf, and here immediately they turned around and with heads to the enemy waited the onslaught. The wolves came on barking at every bound, and springing from ledge to ledge. The sheep stood perfectly motionless. The foremost wolf gained the shelf. Quick as a flash the sheep struck him

and hurled him off the cliff down to the depths below. The other four came dashing on. As they stepped on the fatal ledge each one was sent thundering down in the same way. I was spellbound for a few minutes. I would have given almost anything I possessed for a picture of the scene. The sheep walked leisurely to the edge of the precipice and looked over, then gazed around on every side and leisurely walked back and lay down. I could easily have killed both these sheep, but I felt so proud of them that I would almost have sent a shot at any man who would molest them. I am told on good authority that a large ram will defend the whole flock against any living animal that would give battle on their own grounds. I could not believe this until I saw what I have described; but now I am convinced that a harmless looking sheep can make as fierce a fight as any animal I ever saw, when called on to defend his own rights, and so quick and effective are his blows that nothing can withstand him.

I walked down the ravine to where the wolves had been thrown over, and saw the mangled forms of three of them at the bottom. The other two had caught on the lower ledge and were also shattered to pieces on the sharp rocks.

When I returned to camp I found my man had everything ready for an early start next morning, and after a good night's rest we proceeded down the mountain to our lower camp. We arrived there late in the afternoon and found the other two boys eagerly looking for us. They were so delighted with our trophies that we had to sit up until nearly midnight telling them about our adventures. The next day we set sail, and after two days' delightful sailing we came to anchor at Homer.

HARRY E. LEE.

[TO BE CONCLUDED.]

On Kansas Prairies.—III.

TAMPA, Kan., March 25.—*Editor Forest and Stream:* Don't you wish you were here just for a day. Our motive power, a 10 horse-power engine is stalled by the mud, so the boss and all hands have gone home, leaving me to follow out my own sweet will. Camped here in a "cook shack" with plenty of provisions, a good stove and abundance of coal, I am as free as one of the wildfowl that are passing overhead as I look out. The newly sown wheat fields so lately made desolate by the breath of the blizzard, are greening in the sunshine. The fields of corn and wheat stubble varied by great stretches of unbroken prairie reach away as boundless and almost as level as the ocean itself. As one wanders out into the fields, overhead with honk and quack and whirr of wings, the wildfowl in numbers, at times goodly to look upon, are passing northward; around are heard the notes of the plover, blackbird, robin and many lesser birds; from underfoot the rabbit scurries away; and best of all, occasionally are seen and heard the call and brown back of the prairie chicken. And then in the mud of the sloughs and ponds is written the book of the wild life of the prairie. The ducks, from the mallard down to the teal, waddling awkwardly, but ever keen eyed and alert, have been here. The hawk and owl as well as the lesser birds must stoop to drink. Bunny (for some reason that I do not understand, for otherwise I should think him too dainty to choose such places), makes this his playground. The whole tribe of fur-coated hunters, restless, uneasy and ever bloodthirsty, make this by right of might their highway; and occasionally passing from one hunting ground to another that sly fox of the prairie, the coyote, leaves evidence of his presence. Truly it is a book full of interest to one who cares to read.

A Red-Letter Day.

We were camped down on "The Section" hunting chickens; but it was late November, and the chickens invariably flushed wild; and so far as they were concerned the hunt was a failure. But we found an orchard of an acre or two grown up to sunflowers and other weeds and wholly surrounded by prairie. In one corner of this I unexpectedly flushed a strong bevy of quail; and scoring one, they scattered out through the orchard, and then the fun commenced. One by one the birds were flushed and missed or gathered in as our skill did or did not equal theirs. How many, I do not remember. I know we left some unharmed. But I do and always shall remember the surroundings of that day. All care a thing of yesterday or the future. Ahead, obedient, strong and eager, a very prince among dogs. To our certain knowledge, hidden among the weeds and unwilling to go out on the prairie an abundance of full-grown, strong-flying birds. Overhead the bonnie blue sky of Kansas. All around in their coloring of brown and old gold, flecked here and there by the shadow of a passing cloud, the prairies stretched off and away. The air cool and bracing; and myself, although worn by a long siege of hard work, yet in perfect health. Truly, life was worth living that day, and is richer now as I write, for the memory of such a time.

Mixed up with the rest of the pleasure came one of those incidents so puzzling and yet which go to make up the fascination of a day afield. A quail wholly unharmed was marked down in a patch of tall grass of possibly 10 ft. square; and although three hunters and a dog, that can always be relied on to find a winged bird hidden in grass, leaves or anywhere else, looked that bit of grass through and through, yet it was, I think, fully fifteen minutes before the bird was flushed. It was no "spook" for the lead stopped it the same as the rest; but the question, how did she hide? remains unanswered to this day.

One of your contributors asked what had become of the sand hill cranes. I know but little about them, as they seldom light hereabouts, but pass overhead both fall and spring.

PINE TREE.

A telegraph operator along the Northern line received a slight shock a few nights ago by witnessing what appeared to him to be the Bishop's Falls wolf surveying him through the office window, as though he (the supposed wolf) were meditating on the best plan to secure him for his breakfast. On closer investigation the cause of the alarm turned out to be a dog.—St. Johns (Newfoundland) News.

Camping Ways.

How well I recall my first attempt at camping. Alone and in a dismal drizzle I tried in vain to set up a small tent. Disgusted and disheartened I soon wandered over to a stranger's camp, where I was hospitably received, and inducted into some of the mysteries of camping life. Since then I have lived and learned, and have evolved some practical ideas which may be of some service to other campers.

First the tent. A small wall tent 7 by 7 or 7 by 9 is amply sufficient for one person. And to each man his tent is the best rule. Here is a place where each one can be as orderly or disorderly as he pleases. In tenting with another person one loses somewhat of the pleasant solitude and independence of camp life, and even with the best of companions is liable to some of that social friction from which we flee to the woods. I hinge my top pole in the middle and cut my side poles in the center, joining by a sheet iron tube, which works freely. Thus the whole tent outfit can be folded together into small compass, and put in a trunk strap, and checked to destination. A very convenient form of small tent which would be worth trying would be to do away entirely with guy-ropes, which are always tripping one up, and fasten the tent by strong pockets at the corners, said pockets to snugly fit over iron stakes and tie there securely. I have never found any use for a fly, which is sure to be noisy in a wind. When camping I live wholly outside the tent in the open air except when weather or night drives me in.

For cooking my main reliance is a home-made oven, constructed of a biscuit tin covered with asbestos felt and then with thin boards. A hole in the bottom admits the chimney of a double wick lamp, or better, oil stove. The cost of the whole lamp and all was about \$2, and it fits into a compartment in my provision chest. On awaking I light the lamp, put my breakfast in the oven, and inside of half an hour it will be ready. This oven will warm the tent in cold and rainy weather, and I can camp with it in places where open fires are not allowed, as in the Park at Mackinac Island. I now regard the oven as quite indispensable, and I think every tent in a party should have one. I use the open fire mainly for broiling. This open fire should be built on a heap of earth, turf or sods about 3 ft. high, and hanging your implements around this altar, you can sit in your chair, read a paper and broil a steak or fish in great comfort. As to provisions, get the best. Sink a pail of the best butter in the earth in a cool corner of the tent, and cover with a box, and it will keep in the hottest weather.

For a bed a wire mattress folding cot is best. This with the mattress should be in two sections, and fold with the bedding into a large valise, whose handle will be top and bottom bed rails. The bed sections when set up can be fastened together, staple or cleat, and the near ends should be elastic steel. The whole bed apparatus can then be checked as baggage. If you are skillful you can put your whole outfit into baggage form and limit, namely, bed, provision chest, tent, grip, and save all the bother and expense of freight or express. A party of campers might with these outfits make a very enjoyable and cheap tour of the world, living at their own hotel. Thus, camp on some quiet farm near London, and go in daily by train, and the same for Paris, Berlin, etc. These outfits are also most convenient for gypsying, and can be set up and taken down in a few moments.

The place and time for camping is first of all the Great Northern Lakes, preferably near to rivers and small lakes as on the Lake Superior shore, and after mosquito time, that is after the middle of July. I have camped with little annoyance on Mackinac Island from the middle of June, where for three weeks myself and companion practically had the island to ourselves. The wonderful salubrity of the air and beauty of view are best appreciated by the camper who pitches in the Fort, and I am much surprised that more do not take advantage of the best and cheapest way to enjoy that wonderful island.

HIRAM M. STANLEY.

"The Poetry of Sport."

ALL sportsmen may be divided into three classes, viz., (1) those who, like the proverbial Britisher, say, "Come, let us kill something"; (2) those who have the real love of sport at heart, minus its poetry; (3) those who have the real love, with the poetry of sport.

It is freely admitted that all who have accomplished anything in the field of sport should feel with Whyte Melville that they "have earned for the nonce a consciousness of thorough self-satisfaction intensely gratifying to the vanity of the human heart." We cannot all fully comprehend with the poet the pleasant influences of soft winds and singing streamlets, and shady coverts, of the violet couch and plane-tree shade, nor can we all combine the qualities of keenest sportsmanship with the rare talents of geologist, entomologist and ornithologist; nor can we, on the other hand, quite concur with him who said, "You talk of the poetry of sport; I can see nothing in it but animal excitement," adding, "As a fact, the majority of sportsmen are the most unpoetic type of manhood—men who look upon the primrose by the river bank as but a primrose still." We may, however, sympathize with those who, in lonely hours, in forest and on stream, find pleasure in the song of birds and in the beauties of nature.

Merely to touch upon that most interesting subject, the song of birds, who, at this season, when eagerly looking forward in this northern and eastern part of the continent, to the first cast for trout, does not greet with affection that harbinger of spring, the robin, so unlike his Anglo-Saxon cousin, the redbreast, that warbles round his leafy cove?

The robin, with his accompanying summer tourists—the song sparrow, and hermit thistles, the thrush, and crow blackbird—brings sweet melody.

How unlike his British cousin, too, is our blackbird? Of the former it is said:

"The blackbird's song at eventide,
And her's who gay ascends,
Filling the heavens far and wide,
Are sweet—"

How often are those birds of ours disappointed in their

search for sunshine; frequent snow flurries remind them that summer is not yet.

The hungry crows, as if to poke fun at the new comers, gravely stalk about as if they should have undisturbed possession of the land, their somber coloring forming a marked contrast with the gay plumage of many of the late arrivals from the tropics, who, in common with the flowers of that region, dress in gay and bright colors; but as the flowers have no perfume, their companions, the birds, have no song.

It is remarkable that all migratory birds return to the same spot year after year, the swallows to build their homes without hands under the eaves of church or chapel; others, thrushes and sparrows, robins and blackbirds, return to their familiar groves and hedges, while yet others seek uninterrupted repose in the forest deep.

May we not sympathize, too, in early spring with the fur-hunting trapper or the lumberman alone in the forest awaiting the departure of ice from stream and river. Each counts the hours, the former until he can, on the approach of summer, pick up his traps and seek pastures new in the settlements; the latter until he can exchange the axe for the handspike and follow the course of stream and river to the market of his hopes. He sits awhile in the brief spring sunshine at his hut door; but how cold it is; he still has to wait and watch. In his despondent mood a bluejay, his silent companion during the long winter, appears on the scene, and from an overhanging branch favors him with a cheery, chatty song, and this is what he says: "Summer is coming; summer is coming."

Later on, when even birds are sure of a warm climatic reception, as you are perhaps busily engaged in selecting a killing fly for a monster trout, who, unlike some members of the rising generation, is shy in his desire to rise in his search for food, do you not rejoice to welcome the return of the bobolink, with his merry, joyous note, or the much valued vireos; or, on reaching camp, after a good forenoon's sport, as you smoke your pipe, after the midday meal, do you not rejoice to see your old friend, the moose bird, in his easy going way, in full confidence that he is amongst friends, noiselessly light upon the frying-pan at the tent door and enjoy a luxurious repast from the remains of the pork and beans of your meal? And how eagerly, on your return homewards, you look out in every bit of open country for your friends the thistle birds and yellow warblers; they never fail to bring their music with them.

Thus, so long as summer lasts, we who cast no stone at the poetry of sport, enjoy to the full the presence of our feathered visitors and their joyous melody. The question never enters our heads as to which country or which climate can boast of the best songsters, for as Burroughs says, "The charm of the songs of birds, like that of a nation's popular airs, is so little a question of intrinsic musical excellence, and so largely a matter of association and suggestion, that it is perhaps entirely natural for every people to think their own feathered songsters the best." When winter again sets in, when the silence of the forest, and the comparative absence of bird life cannot fail to strike one, the blackcap titmouse is sure to greet you in your woodland walk with his cheery note, called by the lumbermen "gee up," as it is supposed to give a fillip to the weary team hauling logs to the brow on river bank. The Canada jay, too, seems to follow one's footsteps from the camp to the spot you kill caribou, with his low, soft note, ever soothing, ever sweet, and moose birds, with an occasional member of the woodpecker tribe, with his auctioneer's hammer and a "here-we-are-again," are, like our best friends, ever with us.

FREDERICTON, March 25.

MIC-MAC.

Natural History.

The Northern Porcupines.

A Chapter in Degeneracy.

AS ONLY a probable tenth of the population of North America live where porcupines are found, there is a good share of ignorance regarding them. Early English colonists coming to New England gave the Canadian animal the name of hedgehog, as the nearest approach to the spiny little insectivore which inhabits Great Britain. But the Germans and other immigrants from southern Europe, where the great quilled porcupine, *Hystrix cristata*, is a native, quickly saw the real family resemblance in our species, and stachelochwein, quill pig, porcupine, etc., were the names by which it was most commonly known.

The hedgehog lives almost entirely on animal food and belongs to the same order of quadrupeds as the mole, whereas the porcupine is a vegetable feeder and near kinsman to the ground hog and beaver in the great class of rodents.

In South America and southern Mexico there are tree porcupines, mostly smaller and slenderer animals than the Canadian species, with long, tapering, prehensile tails, which they use in climbing as do the monkey and opossum. They also have a peculiar adaptation of the fore feet which gives them greater grasping power upon the small limbs of trees, and they possess no hair or fur among their thick covering of long quills, as does the northern animal.

The great Cuvier was the first naturalist to undertake the prickly problem of classifying the porcupines. To the Canada porcupines he gave the name *Erethizon* (irritable) and to the long-tailed, tropical forms *Syntheres* and *Sphiggurus* (strangle tailed), on account of their use of that member in climbing. If he had given *Erethizon*, a name signifying club-tailed, it would have fitted the case more exactly, for the whole tribe seem to be alike in their irritability, but the way *Erethizon* uses his tail is the most characteristic thing about him, and has given rise to the popular fallacy that he uses it as a catapult to discharge arrows against the enemy.

Besides, anatomical differences, however, there is an insuperable geographic and climatic barrier separating the monkey-tailed and club-tailed porcupines. Somewhere in the past few thousands or tens of thousands of years our big, lumbering Canada porcupine got separated from

the ancestral stock in the tropics, so that there is now a stretch of country from one to two thousand miles wide, and reaching from ocean to ocean, which is devoid of porcupines, its climate too cold for one and too hot for the other.

As I have just hinted, the Canada porcupines are confined to a cold climate. Their habitat reaches from the northern limit of trees in Alaska and the Hudson Bay regions down the mountain systems to Virginia and Colorado, but they are not found in the lowlands nearly so far south. In this respect they are unique, forming a distinct and isolated climatic group which has no representative in the old world, and are at once separable from all the others in the world by their possession of a true hairy covering, which grows thickly among and overtops the spinous coat in the winter season.

There seems little doubt that porcupines originated in the tropics, and with one exception they yet remain in comparatively warm climates. It is interesting to speculate a little how the cold-weather porcupine, so different from its nimble, spinier, prehensile-tailed kinsmen of the South, should have been banished far from ancestral domain and so effectually kept in exile. Geology essays to bridge the gap and account for these conditions in this wise. The Alleghenies and Rocky Mountain systems in preglacial times formed a passageway from the then cooler tropics to the warm north polar regions. Along this highway to undiscovered lands the ten-thousand year migration of tropical species crept and swarmed and colonized, transforming and transformed as the climate gradually passed from warm to cold again and the unstable land and sea rose and fell. Cut off at last by the transcontinental sea, the animal forms composing the retreating tide of life were given two alternatives, either to accommodate themselves to the changing conditions and "grow up with the country" or to die in the attempt. Among the very few tropical animals which succeeded in passing this ordeal the Canada porcupine is entitled to our respect and, in spite of his ungainliness, our admiration. It seems a plain case of pluck. In the process of acclimation his tail, originally long, pliable and naked, was shortened one-half, at the same time growing twice as thick and strong and clothed with a dense mass of stiff bristles and spines, and was transformed from a delicate climbing instrument to an all-round prop, cudgel and balancing pole. At the same time his legs, feet and claws grew stronger and more like those of a bear; his back and thighs broadened, his skin toughened and became invested with a thick layer of fat, while a warm coat of hair and fur crowded in among the shortening spines and wholly invested the unprotected under parts of his body. This is the scientific explanation of *Erethizon* as we find him today.

The old world porcupines have a much more formidable set of spines than *Erethizon*, and so, in fact, have those of tropical America. The European *Hystrix* has a very handy bobtail. It can make off with fair speed to a place of safety. It also has great burrowing powers and does not trust to trees for shelter, making for itself a refuge in the soil, where it fortifies itself, rarely venturing abroad till night. The Canada porcupine has not such a short tail as *Hystrix*, nor such a long one as *Syntheres*. It is able to do both climbing and burrowing on occasion, but it can do neither well, and has to resort to a bayonet charge to save its neck.

Among the so-called ungainly looking beasts which we meet in the world each seems to have its native element where it appears to advantage and its movements become graceful. The ponderous walrus is transformed by its plunge from the rocks into the sea. The sloth, so helpless upon the ground, rivals the monkey in its ability to traverse the branches of trees. The mole, painfully groping over the hardened surface of the ground, traverses the depths of the soil with a celerity truly astonishing. To this rule of special adaptation to a certain environment the Canada porcupine seems to be the great exception. Under any and all circumstances he is clumsy. Ungainliness with him seems to be a virtue. He can walk, even to galloping a bit in a painful, impotent endeavor to escape insults; but it is merely an effort to turn tail against his pursuer, and, this accomplished, he is content to hunch up and fall around and over himself and sigh and moan like a very Falstaff because he can get no farther. A northern porcupine never seems to have any faith in his outdoor surroundings. Catch one up a tree and ten to one he begins to back down, right into your arms, if you dare to receive him in that fashion. And what a backdown it is! Tail trashing from side to side as if it would cast its owner loose; long claws deeply scratching the tree trunk; snorts and pauses and quill raisings as one foot deviously follows the other, and as a grand finale a tumble of two or three feet to the ground, where he flounders about like a great ball of quills.

If you catch one on the ground and his den among the rocks be not near he is sure to reverse proceedings and make for a tree, perhaps the very one he seemed so anxious to forsake when you chanced to find him in it. Cut him off and most likely he will put his head down and, quills erect, charge for that special tree with fixed bayonets. It takes a sharp whack on the nose to turn him under such conditions. The groan which follows, such a rebuff is pitiful in its human-like tone of helplessness.

Despite these apparently fatal defects in its make-up, the Canada porcupine is not becoming exterminated. Its coat of mail is a most effective protection in 99 out of 100 cases of assault and battery upon it. Mr. E. P. Bicknell, speaking of the stupid audacity of the porcupines on Slide Mountain in the Catskills, thinks that the destruction of such animals as used to prey upon them will result in their greater abundance, regardless of the wanton killing by human beings. Along the southern border of its habitat in the East, in the mountains of southern Pennsylvania, the destruction of its food supply by deforestation has made the porcupine very rare south of the east and west branches of the Susquehanna River. Its abundance in other parts of the State, more suited to it climatically, has not seriously lessened in spite of axe and fire, nor in proportion to the decrease in other forms of animal life in those regions. The panther, wolverine, wolf and fisher are known to kill and eat porcupines, but as these are now practically exterminated in the northern Allegheny Mountains, its only feral enemy is the wildcat, which frequently makes a meal of it in severe weather. Foxes have been

found with porcupine quills in their bodies and mouths, but probably only as pickers at the feast of some larger carnivore or victim of a collision with the porcupine among the rocky retreats which both inhabit. It is not likely that the human consumption of porcupines for food will greatly lessen their numbers. Anyone taking the care and trouble to skin one, however, will find a well-cooked October porcupine that has been fattening on acorns and chestnuts both palatable and nourishing food. Many a hunter and lumberman's camp in the north woods would have sadly suffered for meat if this source of supply had not been available.

Though an indifferent climber, from the standpoint of agility, the porky, as he is called by woodmen, spends a large share of its time in trees, the twigs, nuts and bark of which form its chief food. In securing these its motions remind one of those of a black bear in similar positions, only the bear is by far the more adroit of the two. One habit of the porcupine which I observed last fall in the Pennsylvania Alleghenies not only reminded me of a custom of the bear, but also of the prodigality or vandalism of the squirrel, to which most agile creature, by the way, our sluggish porcupine is not so distantly related. I was hunting for bear signs and came across a large red oak which had been ascended by some animal, apparently a yearling bear, in search of acorns. The ground was strewn with acorn shells and oak twigs from 1 to 3 ft. long, which had evidently been dropped from the topmost branches. I was surprised that bruin could execute such adroit pruning feats without breaking down some of the larger limbs. A few days later, in company with a native hunter, my attention was directed to another sturdy red oak which had a cartload of these terminal branches, each

THE TREE PORCUPINE.

nearly severed as if by a knife, strewn below it. My companion assured me that it was done by a porcupine and that it was a common habit with them. He stated that it was not always done to get at the acorns, but that they often seemed to do it for amusement or to keep their incisor teeth from growing too long. Sometimes trees without acorns were treated in the same way, and in most cases only a small percentage of the nuts were devoured.

While a porcupine has no agility, it has strength, and its powerfully hooked claws and coarsely granulated footpads give it a very tenacious hold upon the trunk or smaller branches of a tree. In securing these slender terminal twigs they gather two or more limbs together, and, if necessary, climb out body downward like a stock until near the end of the branch and then bend the limb inward by means of the strong feet and claws within reach of the formidable teeth, severing it with two or three diagonal bites and letting it fall to the ground. In securing the bark of birch, pine and hemlock, they climb often to great heights, usually girdling the main trunks at considerable elevation where they can sit on a limb to do so, gnawing away the bark and outer wood in the form of a band from four inches to a foot wide. This band rarely encircles the tree at any point, and consequently their gnawing is not so destructive as if the stem were completely girdled.

SAMUEL A. RHOADS.

Reindeer in Sweden.

Consul-General Winslow, of Stockholm, under date of March 3, 1899, says, in part: The only food given reindeer in Sweden is "reindeer moss," a lichen highly prized by the Laps, growing abundantly in the Arctic regions, almost as luxuriantly on the bare rocks as in the soil. It covers extensive tracts in Lapland, making the landscape in summer look like a field of snow. The domesticated reindeer are never as large as the wild ones; Siberian reindeer, domesticated, are larger than those of Lapland. No care is taken of the deer; they thrive best by being permitted to roam in droves and obtain their own sustenance. The moss is capable of being used for human food; the taste is slightly acrid. Attempts have been made to feed hay, roots, grain, etc., to the reindeer, but they have not succeeded.

Near Bangor, Me., farmer George W. Brown chopped down a large dead hollow pine tree for fuel, which as it fell divided into halves, and there in the cavity lay eight fat coons snugly housed away for the winter. Further up in the trunk were two more coons while in the stump was a 50-pounder, the biggest and fattest of the lot. Brown thus got, besides, two cords of dry wood, over 20 lbs. of coon meat.—Methuen (Mass.) Transcript.

"Nature's Compasses."

ABOUT a year ago Mr. G. W. Dearborn wrote an article with this title, in which he pointed out various peculiarities of trees by observing which one could travel in the woods without the help of a compass. Although I had traveled the woods of Maine for over fifty years, and often in company with as good woodsmen as there are, I had never been observing enough to notice any of these signs myself, and had never, among all the hunters I had known, heard anyone speak of being guided by any of them. I thought I would give his theory a fair trial before deciding on its merits.

For nearly a year I have observed as closely as I am able, over a large tract of country, and among all kinds of growth, and the results are as follows: Mr. Dearborn states that the tops of cedar and hemlock always point toward the south. I find that they usually point straight up and when otherwise are as likely to point to one point of the compass as another. If they all pointed as he claims, they would be of little help, as in such places as they grow, it is extremely hard to see their tops even in the clearest weather, and in rain or snowstorms, which are the times when one most needs direction, they could not possibly be seen. He states that trees have more and larger limbs on the south side. I have tested this in scores, if not hundreds of places, in every kind of growth we have in Maine, and I find there is no reliance to be placed in it. Trees throw out the largest and most branches on the side where there is the most room for them to spread. If trees stand alone with room on all sides, most kinds branch out quite evenly on all sides, especially fir and spruce, but when crowded on one side and there is room on the other, they naturally reach out toward the open space. If a road runs east and west the trees on the north side will have the longest branches toward the south; those on the south side will branch most toward the place, where they have the most room to spread and grow without any regard to the points of the compass. Probably at first, about an equal number of branches start to grow on each side, but those on the side where there is the least room either die or are stunted in their growth, while those on the side where there is plenty of room receive all the nourishment which otherwise would have helped the others grow, and so are larger and stronger.

Another point made is that trees have more moss on the north side than on the south. I find that this depends a great deal as to whether the tree is situated in a continuous growth or is more exposed on one side. The exposed side, no matter how it faces, is most likely to have the most moss. I know where there is a long row of maples by the roadside, which are equally exposed on all sides, but every tree is mossed up on the south side. I think this is owing to their being on a southern slope of land and probably face the south wind more than any other. Trees exposed on lake shores will moss most on the exposed side. The same is true on the side of bogs and mountains, those trees most exposed will moss up the most and usually on the exposed side. In the solid woods some have little moss and some a great deal. A sickly or dying tree, often has more moss than the same tree would if healthy. As a rule I find that those trees, especially hardwood trees, if crooked, have the most moss on the concave side; as the crook holds moisture and so encourages the growth of moss, while the outward bend sheds off the water, and consequently is apt to be free of moss. I do not believe that any man who is uncertain about his direction will ever get any help from observing which side of a tree is mossed up. If anyone thinks differently, let him give it a fair trial on different slopes of land where he knows the points of the compass and see how much it would help him if he were lost.

It is also stated that the needles of the pines are longer on the south side. Now if a man were lost in our Maine woods, the chances are very small that he would be where he could find any pine small enough so that he could get the needles, but I tested this till I was tired on our white pine needles and have been very exact about it. Any one who will test it will find that the needles on the white pine tassel are never of the same length on all parts of the tassel. Those at the base are the longest, and grow shorter toward the end. In order to test fairly, the needles to be measured must come from the same relative position in the tassel, on both sides of the tree. I have in all cases taken a tassel from the north side by the compass, and one from the south side, then I have measured a needle from the base of one tassel, with one from a corresponding place on the other; then I have measured one from the end of each. In the many cases I have measured I have never, but in a single instance, found any difference. In this one case that on the north side was the longest.

It is also stated that the gum will be clearer on the south side, while that on the north will be darker and lure more insects to it. As all the trees we have in Maine which has much gum is the spruce, I suppose that he refers to that tree. In the summer time on a hot day the gum on the south side of a tree would be apt to be softer, but the time when men need help to find their way is not in a bright day, but cloudy at best, and more likely in rain or snowstorms, and then all gum would be hard. As to its clearness on different sides, I have talked with one of two men who have just brought in 600 lbs. of spruce gum and he has not seen this difference or anything which would help a man if lost. He says as I do, that owing to gum in hot days being softer on the south side that more insects get stuck on that side than on the north. There is another thing which probably Mr. Dearborn did not think of. It is very seldom that one finds gum on both sides of a tree except on an old spotted line, and then they are as likely to be east and west sides as north and south, to say nothing of the fact that in some cases a man might travel for hours where he could not see a particle of gum on any side of a tree. There are several points which Mr. Dearborn mentioned, but I find them all as unreliable as those cited. No man who is fit to travel alone in our Maine woods, needs any help in keeping his way in a clear sunshiny day. When it is cloudy, or what is worse, a rain, or thick snowstorm, he had better depend on a compass if he feels the need of help, as I do not believe any of the things named will be of the least assistance.

Until something more reliable is discovered than any of

the points of "Nature's Compasses," which Mr. Dearborn describes, it will be safer for any one traveling Maine woods, who needs any help, to stick to the old-fashioned compass. I remember hearing of an old Irishman who tried to ship as a sailor, when asked, "Do you know the points of the compass?" replied, "It is not only a compass that I have, but a pair of them, that me brother Tim, the carpenter, left me when he died. But the devil of a point is left to him, for the childers broke them off boring holes in the flures wid 'em." If nature ever had any compasses the points must have all been broken off before she got to Maine.

Man and Other Animals.

Editor Forest and Stream:

Some expressions in Mr. Hough's last interesting contribution on the subject of game protection lead me to put into words some reflections that have frequently passed through my mind, and doubtless through the minds of many others. I quote from Mr. Hough's article:

"Warden Osborn (of Michigan) has on the whole a sad story to tell about his game and fish. He says that squirrels and rabbits are less each year, that the fur-bearing animals are decreasing, that the bear is disappearing, that the wolverine is practically extinct, that the elk and wild turkeys have disappeared. He cites the killing of one moose in Mackinac county last fall, but learns of no caribou."

The question to be asked is this: Amid that gloomy array of desolation in the game resorts of Michigan, why was that last lone moose destroyed? The inference is that if there had been one caribou left, and its destruction could have been compassed, the caribou would have gone the way of the moose.

One is reminded of the "widow woman" of Zarephath, who said to Elijah, "I have not a cake, but an handful of meal in a barrel, and a little oil in a cruse; and behold, I am gathering two sticks, that I may go in and dress it for me and my son, that we may eat it and die."

It is not assumed as literally true, that the last moose and caribou in that part of Michigan have been destroyed. But the above episode is taken by way of illustration, "to point a moral" if not "adorn a tale." Not infrequently has been seen in print, some such statements as the following: "Mr. Brown reports that he saw last week a remnant of the once numerous flocks of wild pigeon, the first that have been seen in these parts for many years. There were seven pigeons in this flock. Mr. Brown succeeded in securing three of them."

Or this: "A few days ago a deer was discovered in Black township, the first one seen in this county for many years. Several of the neighbors gave chase, and succeeded in killing it. The animal was a large doe, in good condition."

Or this: "Early last week a wild deer came up to farmer Smith's barn with the cattle. This is a remarkable occurrence, as no deer have been seen in this part of the State for at least twenty years. Mr. Smith was fortunate enough to kill the deer, which proved to be very fat. The animal was quite tame, which gave rise to the suggestion that it might have escaped from captivity."

And so on, *ad nauseam*. I presume that most of your readers will recognize the above as familiar specimens. Last fall my family took up their abode in a house in Memphis, Tennessee. There are some fine old forest trees in the yard and those adjoining. Early one morning my ears were greeted with the familiar sound of a squirrel's teeth on the shell of a nut. I soon discovered a couple of gray bunnies in a black walnut tree in my neighbor's yard. They continued to be a source of delight to us, until the Christmas holidays, when, during the general license prevailing in the use of explosives, some boys shot both of the squirrels. What a great loss for so small a gain!

Now, brother sportsmen, let us enter into a little wholesome self-examination. The "epithets," "game hog," "trout hog," have been much discussed of late in the columns of FOREST AND STREAM. Likewise, many brave narrations have appeared in its columns, reciting enormous quantities of game and fish destroyed by sportsmen in various parts of the land, with much self-approval. Occasionally there is evidence of self-restraint, but not often. We can all see clearly enough the "game hog" in others, but can we see him in ourselves? "Oh wad some power the giftie gie us," etc.

Now let us all lay our hands upon our hearts and repeat after me this formula: "If I should see a remnant of seven wild pigeons in my neighborhood, I would not shoot one of them."

"If a deer should come up to my barn with my cows (or any other man's barn), and was in easy range, I would not shoot it."

"If an eagle should light on a tree near me, and I had a gun in my hand, I would not kill it."

"If I were in a hunting party in the Rocky Mountains and had a chance to kill ten elk, I would kill only two or three."

"If I had a chance to kill twenty-six ducks, I would stop at twenty-five."

"If I had a chance to catch one hundred 5 lb. trout, I would stop when I had caught 100 lbs."

"If game should become very scarce in my neighborhood, I would refuse to kill any more until the supply was increased."

Can we all repeat the above sentences with clear consciences? I do not quote, with Mr. L. A. Childress, "He that is without sin among you let him first cast a stone." But I say, we are all rank sinners (or the majority of us). Let us all pelt one another roundly until we all show marked improvement in our habits.

Man has inherited from his remote ancestors two very powerful instincts. One is to "look out for number one" first of all. The other, to kill—bipeds, quadrupeds

and no-peds; feathered and unfeathered. The natural impulse of children, grown up and ungrown up, is to kill, everything that is not protected by some special reasons for curbing this inclination.

It is the office of "civilization" and enlightenment to furnish these special reasons for self-restraint, both as to selfishness and the killing proclivity, and to broaden these special reasons into general reasons—to make self-restraint the rule instead of the exception.

As Governor Roosevelt happily suggested, in a recent plea for the protection of bird life (and I resolved then and there to vote for him if I should have the chance for any office he might run for), let us all teach our children, after having first taught ourselves and our neighbors by our good example—let us guide them, along lines of broad enlightenment to a right conception of our proper relations to our fellow-men and to all of nature's children. And in this connection, allow me to say, under forbearance, let us not forget to embrace, among nature's great family of children, that member so long persecuted under the spur of superstition and ignorance, the non-venomous snakes. I said snakes. COAHOMA.

APRIL 4.

A Jolly Camp in California.

"Boys," said Josh one day in the latter part of June when we three met in "the city," "let's go over to my cabin in the woods and slay a buck or two. Season opens on July 1, you know, and I can promise you lots of game."

Ned and I jumped at the idea, and at once agreed to the proposition, acknowledging at the same time the brilliancy of our friend's intellect.

Josh was the proprietor of a ranch two hours' journey from the city, and, in a wild cañon, had, one summer, with a great deal of trouble on account of the inaccessibility of the situation, built a rough cabin in which four could sleep, cook and eat very comfortably.

It was located at the bottom of a deep, rocky gulch in a little glade covered with magnificent pines, laurels and other evergreens.

The cabin of rough redwood boards, with a substantial roof of shakes, was 20 by 16 ft., lighted by two sliding windows and a wide door. The broad fireplace, built of stones and clay, where large pine logs blazed cheerfully, supplied the hot coals for roasting the venison to perfection, and in cool nights gave forth a genial warmth and cheerful glow throughout the room.

A pretty brook of pure water that thus far in its course never saw the sun, always as cold as one would care to drink, danced by the cabin among the pines, its volume increasing as it went along; its gentle murmur gradually turning into a roar as, further on, it dashed recklessly over the huge boulders and fallen trees, making in one place a wild plunge of 30 ft. clear, and finally emerged into the sunlight miles below.

The spot had been selected on account of many trails leading to the best hunting grounds in the neighborhood forming a junction there.

According to agreement, on the afternoon of the last day of June, we three started out from the farmhouse for the cabin, with a pack horse, plenty of provisions, Josh's celebrated dog Smith and our Winchester rifles. The trail led over a high range of hills through a plateau which looked as if, ages ago, some enormous meteor had burst directly over it and scattered millions of fragments of all sizes from a speck to a meeting house upon it, and since that event chapparal, heath and chemical had grown wherever a little soil had collected.

Finally the trail turned off from this plateau and plunged down the steep side of a cañon through the wild oats and poison oak bushes and we rushed along with a celerity which made up for the slowness of our ascent on the other side of the range.

We clattered down as fast as the old packhorse could slide along, even the dog full of excited anticipation for the coming hunt. He had "been there" before.

Josh remarked that we had better get that horse down "right side up," for if he fell it would take us all night to sort out horse from grub, and he didn't like horsemanship anyway.

Arriving all serene at last at our destination, we stowed things away, picketed our horse, had our supper and smoke, and "turned in" to lie awake for a long time, listening to the soft night sounds of the forest, watching the ever varying glow of the burning logs in the fireplace, and inhaling with delight the cool spicy air loaded with the scent of the pines.

It seemed as if sleep had only just come to us when Josh threw one of his spike-nailed hunting boots against our side of the cabin wall, and, as the crash ceased reverberating through the cañon, queried in a very calm way. "Are you fellows going to sleep all day?"

"Let us now be up and doing,
While the muley cows are mooing,
While the whiskey-jack is cooing,
And the gentle buck perambulates the vale."

Josh is always calm, but humorous.

To our surprise, we found that it was only 3:30 A. M. In spite of the early hour the odor of steaming coffee arose enticingly from the region of the fireplace. We rather sleepily began to tumble out of our bunks and asked Josh if he had been up all night. "Oh, no," said he, "I just slept twice as hard as usual for the last three hours, so as to come out even."

After making a temporary breakfast of hardtack and coffee, with our rifles on our shoulders, and old Smith at our heels, we commenced the ascent of the opposite side of the cañon.

Slowly we climbed the steep trail in the dim light of the early dawn, out of the pines, through open wild oat glades, where Josh cautioned us to keep our eyes "peeled" for a buck; again through chapparal that met over our heads across the path, finally emerging on the top of the ridge.

"Josh," said Ned, as we were leaving the camp, "why do you call your dog Smith?"

"Well," was the reply, "I once knew a man who called his friend Bob, because his name was William, so I called my dog Smith because he was brown—sabe?"

It was light enough to see clearly by the time we reached the backbone of the ridge. Josh, who was in the

lead, suddenly ducked down and whispered, "Deer just going over the edge of the chemical point ahead of us, but think it is a doe." We quietly crept along to get a better view, but found the deer had already moved behind the point.

All excitement, we trod as noiselessly as possible in the direction the deer had taken in order to find out whether it was a doe or a buck; Josh being very particular about not having does shot on his ranch.

We had not gone 50 yds. when our leader made a low whistling sound, that brought old Smith to his heels, and dropped behind a bush.

We dropped also, and looking in the direction he indicated, saw two fine bucks in the shadow of the cañon rooyds. below us, their antlers thrown back and their heads high in the air, evidently suspicious of danger.

Josh whispered, "Now, boys! take 'em right and left as you stand and fire when I count three. Aim low, and darn the man that misses. Ready? One—two—three!"

The simultaneous crack of the rifles rang out on the still morning air and echoed from peak to peak. One buck fell. The other, only wounded, bounded off over the low brush. Before he had made a dozen jumps, however, Josh, who was prepared for just such an emergency, pulled the trigger, coolly remarking, "That fellow might just as well stay, too."

The buck gave a tremendous bound, but came down, made two or three somersaults down the steep hillside, kicked desperately a few times and—staid.

"Rah for our side," we shouted, and Ned and I plunged wildly through the brush, regardless of skin and clothing to where our game lay. Josh, to whom all this was an old story, picked his way more leisurely; but Smith, even more excited than we were, rushed yelping ahead ready to grasp the throat of either animal which might not be quite dead.

"Well done," said Josh, on joining us as we were examining the effects of our shots, "a three and a four-pointer. Your first deer, too, Jay. You didn't kill him outright, but he would not have gone far with that hole in him. By the way, you should always aim for the spot you intend to hit, and not for the whole deer. Overshooting is the beginner's great fault, but next to it comes that of trying to hit the whole animal at once—sabe?" I acknowledged that I had not stopped to pick out any particular spot, but promised to do so in future—if not too excited.

While we were dressing the game and preparing the legs in such a way that we could shoulder the deer like knapsacks, old Smith disappeared. In a short time we heard his familiar "Yap! yap!" down the cañon, accompanied by the almost unmistakable jump, jump of a deer in the bushes. We looked round and seized our rifles just in time to be too late. A fine buck was coming toward us, but on seeing our heads above the bushes wheeled like a flash and was out of sight in the chapparal before we could draw a bead on him.

"That buck jumped as if he'd been wounded in the leg last year," said Josh. "Wouldn't be surprised if Smith treed him before long."

We swallowed our disappointment, and concluded that we already had enough to carry up that brushy hillside anyway.

Shouldering our game, we climbed, pausing many times for breath and rest, now and then making wild grabs at the bushes to keep our balance, and working laboriously upward toward a spot to which the horse could be brought. It finally ended, however, in Josh's carrying one of the deer most of the way to the top, and then coming back after the second. He is tall and very slight, but apparently made of india rubber, and he could beat us heavy fellows all hollow at this sort of work. He said, when we utterly collapsed and sat down to wipe off the perspiration, "You city boys are not used to eating your bread with the sweat of your brows. One does not mind it when one is used to it." I frankly acknowledged that I usually preferred my bread dry; but could stand a little moisture on an occasion like this.

We drew lots to see who should go back to camp to get the pack horse, and this duty fell on Josh. As soon as he left we took out our tobacco pouches and settled down to await his return, enjoying meanwhile, most thoroughly the magnificence of the wild mountain scenery, and watching, with a pleasure which strangers to such scenes can hardly appreciate, the light from the rising sun as it lit up hillside after hillside in the apparently unending series of cañons and gorges whose depths seemed so dark and cool in comparison with the now bright peaks.

As the sun rose in the cloudless sky we sought the nearest shady spot and began to speculate upon Josh's long absence, finally deciding that he must have stopped to repair the horse or something of the kind. At length, however, he appeared, and without explaining the cause of his detention, but with a twinkle in his eye, which we did not understand, proceeded to load the game.

We retraced our steps of the early morning, and finally plunged into the refreshing shade of the pines around the cabin with a feeling of relief, the rays of the July sun seeming "a foretaste of the future" as Ned remarked.

To our astonishment we found another buck hanging in front of the cabin door. We looked at Josh, who only smiled and said, "I told you Smith had taken an interest in that fellow. Guess the old cuss found out the deer could not run very fast, and staid by him until he rounded him up; thought I might just as well gather him in."

It turned out that the dog had bayed, or "treed" the buck, as Josh quaintly expressed it, within a hundred yards of the camp, and, on his way down for the horse Josh had "gathered him in" without our hearing the shot, and had dragged him to the cabin.

We hung our game on a stout pine limb and the three bucks in a row looked very imposing.

Ned remarked that he knew lots of fellows in the city who would give fifty dollars for such sport as we had just enjoyed that morning. "Guess some of them must be like the chap I had such a laugh over last summer," said Josh. Knowing there must be a good story behind the remark, we both immediately demanded it.

"Well, it isn't much of a story, but you can have it. A young fellow I had known for a number of years asked me one day if I wouldn't give him a chance to shoot a deer. He said he would give anything to shoot one; he knew he wasn't much of a shot, but was sure he could hit an object as large as a buck.

"I told him I'd give him all the chance he wanted, but if

he'd never seen one before it would either look big enough to scare him, or else so small that he would wish his rifle were loaded with a few pounds of buckshot instead of a single bullet. Still he was certain he could hit one, and that such a thing as 'buck fever' would never bother him.

"Well, I took him out one day and placed him in a mighty good stand to get a shot, and put the dog in the brush right below him. From the tracks around there I was almost certain there must be a buck not far off.

"Pretty soon Smith gave a couple of yaps and I saw a big fellow jumping over the bushes toward my confident friend.

"Just at this moment I heard a succession of shouts and shrieks and saw him jumping up and down like a crazy man, waving his rifle in the air. Thinking he must have stepped on a rattlesnake and got bitten, I was on the point of starting to run toward him, when I began to make out the words: 'Josh! Josh! for Heaven's sake! there's a buck! shoot him! shoot him! Look out, he'll get away! Shoot him quick! quick!' Well, boys, I did shoot him as he came right up to me, but was shaking so with laughter that I nearly missed a dead shot.

"I asked my friend why in blanknation he didn't shoot the deer himself, as that was what he had come out for. 'Jerusalem,' he said, 'kick me; kick me hard! never thought of it.'

"I couldn't keep this affair all to myself, you know, and he had to set 'em up pretty often for a while afterward; and I hear he is very touchy ever since when you discuss the different forms of buck fever in his presence."

While Josh was telling his story, we were making preparations for breakfast, which soon appeared. Deer's liver broiled on hot coals was the principal dish, and it vanished rapidly before our ravenous appetites, well sharpened by the morning's tramp.

The rest of the day was spent in the usual camp style; that is, we swept the cabin, got wood for the fire, straightened things out, had dinner about 5 o'clock, and afterwards strolled, or rather climbed, up on the top of a hill to watch the shadows deepen in the valleys until the sun finally disappeared behind a distant pine-fringed ridge. The stars commenced to speck the eastern sky, and the poorwill's sweet but melancholy notes were breaking the evening stillness as we slowly descended to the darkness of the forest camp, each deeply impressed by the quiet beauty of the scene and loth to leave it.

While chatting and smoking around the camp-fire we decided to kill no more deer this time, having as much venison as we could use, but to try to find a short cut to a ridge near by, which Ned and Josh had always reached by an old trail a long way round.

Next morning we got a regular breakfast before starting on our explorations, and then went to the ridge by the long way, intending to make an attempt to cut back to camp through the timber.

Old Smith did not seem to understand our want of interest in deer that morning, and after a while we missed him. While we were, all three on top of a pile of rocks, looking about for an opening in the forest, we heard his sharp bark coming in our direction, and in a few moments a large doe came bounding along, pausing a second to listen within a few yards of us. Smith showed up on the deer's track just as we jumped down from the rocks. He seemed rather confused. Josh called to him to stay close. He took two or three steps in the direction the deer had followed, stopped, looked back at us and again toward the deer, and finally, with head and tail drooping dejectedly, came back to Josh's heels. The latter remarked that our not potting that deer had taken the wag out of Smith's tail, and he looked disgusted.

We missed him again shortly after, but thought no more about him until we arrived at the camp after a hard struggle through brush and timber in a vain attempt to find a serviceable short cut.

When we had absorbed a comparatively large proportion of the deliciously cold water in the little brook we unlocked the cabin door, and, to our utmost astonishment, there was old Smith, curled up most comfortably on Josh's bed. As the windows were closed and the door padlocked, it beat us completely; and at intervals through the rest of the day some one would remark—to the trees, apparently—that he "gave it up."

We took a cold lunch and loafed around, enjoying the shade and the afternoon siesta until the lengthening shadows and the delightful coolness that comes on toward evening warned us that it was time to think about supper. We were suddenly startled by an exclamation from Ned: "Great Scott! I've got it!" Without deigning to notice our inquiry as to whether he ever took any thing for it, he rushed out to the gable end of the cabin, where he found what we had not before noticed, a rough ladder left standing against the clay chimney, which was about 10 ft. high. We followed in hot haste, only to hear him wonder "how in blazes did that old duffer know that the chimney opened into the house."

The mystery was solved. There were the dog's tracks in the ashes of the fireplace, where he had jumped, or rather slid down the chimney.

"Talk about horse sense," said Josh, "dog sense beats it from Alpha to Omaha. I'll bet a dollar and six bits none of us would have thought of climbing down that chimney to get in, though it's big enough for two at once, unless it was Christmas time."

It really was almost incredible that a dog could have sense enough to understand the idea of the chimney connecting with the open fireplace, and to climb up a ladder on the outside and scramble down on the rough stones inside; but the fact remained as "gospel truth," and can be certified to on oath by all three of us. He simply saw that we did not care to hunt that morning, and getting tired of working for nothing, had returned to camp. Finding the door and windows all closed, and longing for those soft blankets inside, he had prospected around and hit upon this novel method of entering a house—à la Santa Claus.

When the dishes were washed that evening, and we were enjoying the "pipe of perfect peace," as Ned expressed it, we agreed to let the deer alone for awhile and to pass the remainder of the time we could spare from business in the health-giving rest and thorough enjoyment of the pure mountain air, free from all fears of rain or dampness in this long California summer. Josh had arranged for one of his vaqueros to come for our game, and keeping only enough for our own use, we divided the

venison, sending generous portions to those of our friends who we knew would appreciate it.

On the eve of our departure we were bemoaning our hard fate that dragged us back to work, arranging for the next expedition, and assuring each other that nothing short of glue on the seat of our stools or the death of some distant relative with a will in our favor attached would keep us in our offices when the time came for it, when Josh broke out with

"Ch, it's lots of fun to camp
In a climate free from damp,
Where the sun shines all the summer,
And every city bummer
Can rusticate and busticate
His last year's Sunday pants.
There's nary rain to wet you through
Or make you feel so cussed blue;
And the only things you veto
Are the bills of the mosquito,
(The birds that bite both day and night),
And those pesky little ants."

Here we caught him, gagged him and tied him to a tree till he promised not to inflict any more of this stuff upon us—until next time.

JAY EM.

American Game Parks.

The "Forest and Stream's" Fifth Annual Report on Game in Preserves.

(Continued from page 265.)

The Sapelo Rod and Gun Club.

THE Sapelo Rod and Gun Club was incorporated under the laws of New York, Jan. 8, 1898. The following particulars with regard to the club preserve are taken from the New York Evening Post:

The preserve covers an area of about 10,000 acres, or some twelve square miles. It faces directly on Sapelo Sound, and is bounded on the north by White Chimney River and on the south by Sapelo River, so that in all it has a water front of about fifteen miles. This tract of land was originally made of four old plantations, and during the war was the scene of many stirring encounters. Since that time it has been practically abandoned, and most of it is to-day in a state of wildness that, together with its peculiar position between the two rivers, makes it an almost ideal natural game preserve. Unlike much of the surrounding country, the land is high, and covered with a heavy growth of Georgia pine. Here and there are open stretches and clearings that mark the once cultivated fields, covered in some instances by a scrub palmetto growth. North, south, east, and west it is one mass of verdure, and semi-tropical plants; palms and flowers are found in great profusion.

Topographically the land is high in the middle, sloping gradually to the shores of the rivers that bound it on either side. The heavy pine forests are surprisingly free from underbrush, thus affording better chances for a shot when the game is flushed. At the same time the quail meadows and the natural growth in the clearings furnish an excellent cover for the birds, so that it necessitates careful and thorough hunting, a fact that usually invites the prowess of the true sportsman.

Along the shores of the Sapelo River for some three and one-half miles is a bluff that rises from 30 to 80 ft. almost sheer from a white and sandy beach. It is along this bluff that the headquarters of the club have been established. The white, sandy beach offers facilities for excellent bathing, and the view from the top of the bluff is charming. A temporary house, that will accommodate about twenty members, can be used at once, and no better place could be selected for the permanent home, looking out as it does across the sound, past the islands that fringe the Georgia coast line, and out upon the wide expanse of the Atlantic Ocean. Back of it are the heavy pine woods, and fish and game in abundance almost within reach. Lob cabins or lodges will be scattered through the preserve to serve as temporary camps for those who wish to rough it to the fullest extent, or who, in search of game, are led too far away from the house to return the same day. They will be built on the same order as the log camps in the Adirondack region that are so attractive to any who have spent a day in the Northern Woods.

A double wire fence will be built across the westward boundary from river to river, preventing the game from straying off the preserve, and affording a slight protection from poachers. Of the game, quail abound, perhaps, in the largest number, the field making easy ground, while there is also plenty of excellent cover. Game and fish of infinite variety are plentiful, and will repay the most exacting angler or most ardent hunter for his trouble. An occasional bear, quantities of deer, and some wildcats make up the larger game, while wild turkey, water fowl of all kinds, quail, ruffed grouse, woodcock and pheasants are plentiful. The pheasants are of the English variety, and rather scarce, having strayed there from other preserves, but once the club is established, it is intended to have a pheasantry, where the young birds can be reared and properly cared for till ready to be released. This will insure plenty of this game bird, that is such a favorite with all sportsmen. The rivers and sound swarm with fish; the salt-water trout that closely resembles our weak-fish furnishing, perhaps, the best sport. Add to these innumerable turtle, terrapin, oysters, crabs and shrimps, and every table delicacy known to best hotels is ready to be taken for the trouble.

The Country Club.

On March 13, 1890, thirty-seven members of the Pacific-Union Club, of San Francisco, interested in field sports and country life, organized a club, which was called the Country Club. In September of the same year this club leased, with privilege of purchase, from Mr. Payne J. Shafter, 1,000 acres of land in what is known as Bear Valley, on the Shafter Ranch in Marin county, California; and at the same time they obtained from Mr. Charles Webb Howard and the owners of the Shafter ranches, leases for shooting and fishing privileges of a large tract of land containing about 76,000 acres.

The membership of this club is limited to 125 mem-

bers, and no one, by its constitution, is eligible to membership unless he is a member of the Pacific-Union Club.

Shortly after the leases before mentioned were obtained, the club set to work to provide accommodations for its members, and it has constructed upon its grounds in Bear Valley, a club house, stables, barns, dog kennels, shooting box, and all of the appliances and accessories incident to club life in the country, and has expended in the neighborhood of \$25,000 for these improvements. The present leases expire in September, 1900.

Nittany Rod and Gun Club.

The club was organized at a meeting of subscribers held at Williamsport, Pa., April 30, 1897, with the following objects in view: First, to procure a modern country club house where its members could find a suitable and attractive retreat from business cares and a place for the entertainment of their families and friends. Second, to establish a quail preserve of sufficient area to provide ample shooting for members and their friends, and third, to secure a trout preserve that can be yearly stocked with large fish, and at the same time enjoy immunity from the market fishermen, whose wholesale slaughter has for years depleted the streams of the State. How well these objects have been carried out may be seen from the following facts taken from the club prospectus:

"The quail preserve is composed of about 100 farms, with an area of 20,000 acres, located in Walker and Marion townships, extending from the Bald Eagle Mountains on the north to the Nittany Mountains on the south, thence through Nittany Valley for a distance of ten miles, or in the neighborhood of thirty square miles of territory. The exclusive game rights on these properties are under lease to the club for a term of years.

"During the fall of 1897 and spring of 1898, 4,000 mated quail from Western States were planted on the preserve for breeding purposes. Based on an average yield of eight young birds to the pair, it was estimated there would be 20,000 quail for the shooting season of 1898, but from inquiries made after the spring nesting, it has been learned that nests found contained from fourteen to twenty-eight eggs. As many of these birds nest twice in the same season, the success of this feature of the club would seem to be assured. In all probability no further stocking will be necessary for several years.

"For the purpose of a trout preserve, the club has leased for a term of years, Little Fishing Creek and Green Valley, through which it flows from its source to the club house, a distance of eight and one-half miles. The stream heads at the western extremity of this valley, and its course to the club house has a fall of about 700 ft. During the summer of 1897, sixty-three tight dams were constructed on the stream, and in November of that year 7,000 trout, ranging in size from 1½ to 9 in. in length, were placed in these dams. It is the purpose of the club, so long as it may be necessary, to each year restock the stream with large fish.

"As already stated Green Valley is about eight and one-half miles in width. No part of this territory is under cultivation; in fact, there is nothing more wild or picturesque to be found in the Allegheny Mountains. For many years these have been favorite grounds for pheasant and wild turkey shooting. These birds will, doubtless, rapidly increase under the fostering care and protection of the club.

"The home of the club is particularly fortunate in its location at the base of Nittany Mountains near Hecla Park (Mingoville Post-Office), Centre county, Pennsylvania, and within five minutes' walk from the station of that name, on the Central Railroad of Pennsylvania. The house contains twenty-five rooms, including a sitting room, 20 to 38 ft.; a dining room, 20 by 24 ft.; each of which have two large, open fire-places; ladies' parlor, also with an open fire-place; large well-ventilated sleeping apartments, card room, bath rooms and buffet, all heated by steam; and supplied with spring water piped from the mountain near by. Double-deck porches, 16 ft. in width, surround three sides of the house, having a floor surface of about 5,000 square feet. By means of a long-distance telephone in the house, members can be in easy communication with their homes and business offices.

"The club has now in contemplation the erection of additional buildings for a bowling alley, billiard and pool rooms; also a dog kennel of ample proportions, to be under the care of an experienced and competent dog trainer.

"The club house grounds proper include a lawn of 30,000 square feet, appropriately laid out with limestone screening walks, an athletic field of eight acres for trap-shooting and other field sports, and an apple orchard of seven acres."

Santa Clara Preserve.

Darwin J. Day is superintendent of the Santa Clara preserve, Brandon, Franklin county, N. Y. This includes an area of about 44,000 acres, of which 1,600 acres are burnt land. The burnt land is a great resort for deer, and an excellent place for still-hunting. Mr. Day writes that last season sixty-two deer and one bear were killed. He adds: "With the experience I have had within the past four years regarding the game, I am satisfied that the deer are increasing very rapidly under the present law, and wish also to say I do think that we ought to have a bounty on foxes and otter, as otter destroy so many trout and foxes so many birds. Aside from that, I think the law as it is is as near right as to suit all classes of sportsmen as it can be."

The Magaguadavic Fish and Game Corporation.

The Magaguadavic Fish and Game Corporation was incorporated under the laws of New Brunswick in the year 1892, with a capital stock of \$20,000 divided into 400 shares at \$50 per share. The preserve of the corporation consists of a tract of land 5,000 acres in area, known as the Stanus Grant, situated in Charlotte county in the southeastern part of the Province of New Brunswick, and is practically an unbroken wilderness. The property is covered by a dense forest, interspersed by more than a score of lakes and ponds and traversed from end to end by the beautiful and picturesque Magaguadavic River, from which the corporation derives its name, which, with its numerous tributaries, furnishes opportunities for some of the most delightful and exciting canoe trips in the Province, a region noted for this sport. It is unsurpassed

as a shooting and fishing country. It seems to have escaped the notice of the sportsman until recently, and its denizens on the land and in its waters have been allowed to increase in a primitive manner. When the pioneer sportsmen came here from the overcrowded and more famous resorts they were both surprised and delighted with the abundance of game, fur, fin and feather, and came away enthusiastic in its praise, with a determination to return. The formation of the above named corporation soon followed, and for a time flourished, increased in membership and seemed assured of a prosperous future; but at the height of its prosperity, for various reasons, it began to lose ground until the year 1895, when a partial reorganization took place; new blood was infused into its management, and a new era of the brightest promise seems to have dawned on its affairs.

Shocco Game Association.

The Shocco Game Association, of Baltimore, Md., controls 19,000 acres of land in North Carolina, which is strictly preserved for the benefit of members. A part of the land is leased and part purchased outright. The headquarters of the club is the fine old mansion known as "Montmorenci," built by the late Gen. William Williams at a cost of \$33,000.

Maple Lake Club.

The Maple Lake Club was incorporated July 29, 1892, with a membership limited to ten. The property of the club consists of Maple Lake and about 2,000 acres of woodland in the town of Wilmurt, Herkimer county, N. Y. There is a substantial club house for the use of members. The lake has never been stocked, but it is a natural trout water, and is considered one of the best breeding grounds in the State. There is good partridge shooting in the club grounds, and some deer. Deer are increasing.

Mr. John Cummings, Jr., writes that the fishing has improved each year, and that the club has become more popular with the members and their friends.

Henry L. Smith.

Mr. Henry L. Smith, of Albany, N. Y., is proprietor of a preserve in St. Lawrence county in the Adirondacks. The preserve includes four and one-half miles of water and is ten miles from the nearest town. There are good buildings in the tract, and as Mr. Smith writes, "lots of deer and the best of brook trout fishing."

Page Fence Company.

The Page Fence Company have lately made an addition to their game park at Adrian, Mich. At the present time they have ten buffalo and about twenty elk and thirty deer. They also have eight black bears. It is understood that all the animals are in good condition.

Mat-a-mek Preserve.

"Mat-a-mek preserve, my little place in the woods, is not large nor important enough to be classed among the American game parks. In our part of the woods we have managed to hold our own so far as deer and partridge and trout are concerned, and we hope that next year will show a decided improvement. ASHBEL P. FITCH."

It is reported that Mr. E. B. Bailey, of Windsor Locks, Conn., has purchased the island in the Connecticut River just above the railroad bridge with the intention of stocking it as a game preserve.

The Hull (Ontario) Electric Railway Company has under contemplation the creation of a game park to be stocked with American game animals.

Boston Branters.

Boston, April 8.—The first party of Monomoy brant shooters got back to Boston the other day. The weather was very bad—only one or two days in the whole week of their stay that it did not storm or blow a gale. But they secured thirty-two brant. This they consider a very good record for the first party of the season. They calculate that there was not a young bird in the lot; that they were all old birds that have staid around that section all winter. The man who has charge of the property of the Monomoy Brant Club, say that brant have been around all winter, and up to the time the first party left home, no brant had arrived from further south this season. There was some pretty fair black duck shooting, with now and then a sheldrake. The third shooting party is now in camp, and are reported to be having fine shooting, with more flight brant than the other parties saw.

Mr. C. H. Alden, already mentioned as being at Homosassa, Florida, and greatly enjoying the shooting and fishing, has started for home. In his last letter to his friend Charlie Brown, he mentions taking thirty-four bass in a few hours' fishing. One day he had the good fortune to hook on to a "cavalier," and fought him for hours, with a light rod. The fish was finally brought to the net, and weighed 15 lbs. Mr. Alden writes that they are great fighters. He is much pleased with the place and its surroundings. It is about three miles only from the Gulf coast, on the Homosassa River. There is great sport there in the winter season for both rod and line and shooting sportsmen.

SPECIAL.

Deer in the Eastern Townships.

SUTTON, Province of Quebec, April 3.—*Editor Forest and Stream:* It will be of interest to many of your sportsmen readers to learn the fact that deer are beginning to once again seek and breed in their old haunts in this section of the eastern townships. For years we have seen or heard of only an occasional deer having been seen in Sutton and the surrounding towns, but during the past season no less than nine fine deer were shot and secured during the open season on what is known as Sutton Mountains, lying between this village and Glen Sutton, and extending its ranges toward the town of Potton, Que. Others of the surrounding towns—forming our famous eastern townships of the Province of Quebec—report the same gratifying conditions of increase. Now let our close season game laws be generally observed, and within a few years our native township sportsmen should not have to go 100 miles and more to Lake Megantic and Spider Lake and to Maine for their large game, but will be able to find it within easy reach.

WM. BROWN.

"Concerning an Epithet."

Editor Forest and Stream:

As you know, I am no sportsman, but I am an old hand at newspaper wars, and think I have known as many as the next man, and have watched the results of such rows, and I am quite sure that the man who indulges in vituperation of dissenters from him, seldom persuades anybody. The villified are only made angry and the man with no convictions on the matter remembers the old adage for lawyers, "When you have no case, abuse the other side and his attorney," and judges of the merits of the case by the style of argument used.

What is the aim of this epithet campaign? Conversion of "hogs" or conviction in the public mind as to the rights or wrongs of killing too much game? The hog cry is not apt to convert, and with folks like myself that don't care a fig for sport and would not give one cent to save all the strictly game creatures in the country from extinction, that style of game preservation is not alluring. I know it would be preferable to have no "game" than to have it set up that if my friend X Y Z shoots more birds than an undefined authority declares warranted, he is a "hog"; I know he isn't anything of the sort, and how am I to know whether Tom, Dick and Harry know what a "sportsmanlike" limit is?

Who was the hero of fiction who laid his success in war and poetry to his following his sister's advice, "Moderate your transports?"

Let me add, that while I claim the individual right to care nothing for sport and to think that I am none the worse for this indifference, I am not "hog" enough to respect a man less because he is devoted to it. That is his right, and I have no right to condemn him. But I do not admit that a "sportsman" is one bit the better, or worse, man from being so.

W. WADE.
OAKMONT, Pa., April 7.

PHILADELPHIA Pa.—Editor Forest and Stream: The discussion in the columns of FOREST AND STREAM concerning the propriety of an individual arrogating to himself the right to denounce other individuals who differ from him as to the amount of game they may kill in one day, I perceive has aroused a great deal of interest. There has been quite enough opinion, adverse to the stand taken by Mr. Schenck, to show that his opinions do not truly represent the opinions of sportsmen.

In FOREST AND STREAM of April 8 I read a vigorous letter from him in support of his contention. There is no doubt of his sincerity. The fact that he, on his own confession, was once a game hog and reformed, encourages me to write this communication to you; for if by argument he can be shown to be now wrong, I am sure he has moral firmness sufficient to enable him to again readjust his ethics on better lines.

Before beginning the argument proper, I beg permission to quote from Mr. Schenck's writings as follows: "It strikes me that no unselfish, reasonable sportsman can feel otherwise than 'hot' after seeing, as we do week after week, and month, the pages of nearly every one of the papers devoted to field sports besmeared with the bloody records of intemperance, inhuman, wanton slaughters; records that make one's trigger-finger itch with murderous intent, or cause him to hanker for the enactment of a law that would land some of these evil-doers into the penitentiary."

I wish to ask Mr. Schenck, concerning this point, whether, if he were clothed with full authority to do so, he would kill a man who killed more than his share of game in a day? Would he send a man to the penitentiary for life for the same offense? Suppose, at the period when he was a game hog, some game fanatic with a nervous trigger-finger had drawn a bead on him and filled his person with buckshot. In the dark ages, when emotion governed the action of some men more than did reason, other men were burned at the stake, or imprisoned for life, or were executed in various barbarous ways for matters of opinion; but at the present day the great pride of the civilized world is in its tolerance of all opinion, and in its laws free from all taint of vengeance.

In respect to the duck-shooters' club, whose members are permitted to kill fifty birds in a day, if my memory serves me right this club owns or leases its grounds and protects them as a preserve, so that the members have certain property rights in the preserved game, differing entirely from the ordinary common law rights of the public. They pay out money for their property rights and guard them much as Mr. Schenck does his own personal property rights.

As to any record of sport with a shotgun or rifle, if anything at all is killed, the record is sure to be more or less bloody; this in reference to the excerpt quoted above. I do not think that Mr. S. can point out the "pages besmeared with the bloody records," etc. The sportsmen of to-day are far in advance of those of years ago in the matter of the proper quantity to be killed in one day, and in the ethics of sport. I am sure that this change was not brought about by angry snarls and the showing of pointed teeth.

Suppose that one man, who has had but one great opportunity to kill a large bag of game—let us say 100 ducks—offends from the standpoint of Mr. S. He has traveled a long distance, has liberally spent his money in the section wherein he shoots, and, in the enthusiasm of the sport and the bountiful supply he killed 100 birds in one day. Yes, let us assume that he killed 300 ducks in three days. Now let us suppose that another sportsman, proud of his own shooting abstemiousness, killed but ten ducks in one day, yet goes out every day for thirty days, killing thus a total of 300 ducks. Will Mr. S. be so good as to explain how one got more than his share while the other got less, and wherein lies the difference in the total result? If one shot too much game in short time, the other shot an equal amount in a longer time, so that as a matter of mathematics or an equality of shares, they both took precisely the same quantity. Eheu!

Game is the property of the people, and as such is not valued and preserved with a view to the delectation of some man or men who own guns. It has a food significance of greater public value than a sport significance. The lone shooter, who rants that his sport may be preserved for him, should reconsider and recognize that the

public at large may appreciate only material values of public importance.

Concerning the law on the matter Mr. Schenck proclaims as follows:

One of your correspondents, Mr. L. A. C., takes exception to my argument, because it seems to remotely connect the crime of larceny with immoderate game killing, and holds that, while there are statutory provisions governing the one, there is no law to govern opinions as to what should constitute a reasonable bag for a day's shooting; in fact, he in effect holds that in this matter every man is a church unto himself. I beg leave to differ with the gentleman; the great unwritten law of "common honesty" governs in these premises as perfectly as does any law on the statute books relative to larceny, although it does not perhaps affix quite so severe penalties. If the unwritten law named is not sufficient to cover the ground, the "golden rule" indirectly applies, as do many other of the teachings relative to moderation and temperance, of the Great Teacher, whom your correspondent quotes. Forbearance in dealing with the immoderate game killer has ceased to be a virtue, and the day of retribution is at hand.

The unwritten law of "common honesty" is not well taken. There is no such law. Honesty is the source of all law, and not the law itself. In any case, it has no application whatever to the point in question. The game of a State belongs to the people of that State. The title is very vague and remote. While the people own the game, no one person has any title to it whatever till he has the game reduced to his possession. After that it is the person's own property, with some or no qualifications in different States, according to the different laws which govern therein. There is no dishonesty whatever in killing the game when the statute and common laws are observed in the killing. There is no share belonging to anyone. The game is in a state of *feræ naturæ* before it is killed; afterward it is the property of him who takes it. If we consider that the people has shares, then the man who does not own a gun has just as much right to his share as has the man who does. If Rhode Island has a population of 420,000, with an area of 1,306 square miles, then there probably is less than one bird to each person within that State. Any man who takes more than one bird takes, therefore, more than his share. Mr. Schenck's position may be brought to the *reductio ad absurdum* in many other ways.

L. A. CHUDRESS.

New Brunswick Notes.

SOME of the game officials have been displaying a commendable degree of alacrity of late in looking after persons suspected of killing moose in the deep snow. The most flagrant case reported was that of Mr. A. E. Hanson, a Deputy Crown Land Surveyor, who, by virtue of his office, is also a game warden. Mr. Hanson was commissioned to run some lines on the headwaters of the Tobique and Nepisiguit. He shot a bull moose some weeks ago, and upon reaching Bathurst last Saturday was arraigned before Stipendiary Magistrate McLaughlin on complaint of Warden Bishop. Mr. Hanson pleaded guilty to the charge and the minimum fine of \$50 was imposed. His plea was that he was short of provisions and that his party needed the moose hide to sleep upon at nights when camping in the snow. This plea is rather weakened by the fact, not brought out at Bathurst, that before leaving Fredericton upon the survey referred to, Hanson borrowed a rifle and stated to a number of persons that he proposed to shoot a moose if he required it.

Long before Hanson emerged from the survey it was reported at Fredericton and elsewhere that he had killed a moose and local sentiment was very strong against him, not only because of the position which he held, but the boldness he had shown in defying the law. At the instance of Game Commissioner Knight, information was lodged against him at Fredericton, and it can scarcely be doubted that if Hanson had faced the music here the magistrate would have imposed the maximum penalty of \$200. Country justices are notoriously lax in their administration of the game laws, and there is quite a general belief that, in the present case, Hanson knew that the authorities were on his track, and deliberately promoted the proceedings at Bathurst in order that he might escape with a minimum penalty. However, the end is not yet. If it shall appear that there was any collusion in reference to the Bathurst proceedings, Hanson will again be arraigned on the information laid at Fredericton. In any case, the leader of the Government, Premier Emmerson, announces his intention to suspend Hanson for a period from his office of Deputy Crown Land Surveyor.

One of the strongest obstacles in the way of a vigorous enforcement of the laws is that country magistrates are disposed to take a most lenient view of the offenses brought before them, in nearly all cases imposing the minimum penalty and frequently allowing this to stand. Cases are even mentioned where they have ignored the plain provisions of the law entirely, and imposed a fine of \$10 for killing moose out of season, whereas, the smallest amount they could legally impose is \$10. For this reason the Chief Game Commissioner is endeavoring to have offenders, as far as possible, arraigned before magistrates of intelligence and experience in St. John, Fredericton and other cities. At St. John on Saturday last Albert Alward, of Queens county, appeared in answer to the charge of hunting a cow moose and of killing a moose out of season. He was fined \$100 on each of these counts, the latter being allowed to stand. Alward was captured through the clever work of Detective Ring. A confederate escaped, but is being shadowed.

A great deal depends upon the county game wardens. Some of them are active, intelligent men who discharge their duties fearlessly; others are nonentities who like to whittle a good fat cedar shingle at the grocery store. Warden Henry Bishop, of Bathurst, is one of the most efficient officials to be found in the Province, being not only a friend in need to the visiting sportsman, but a terror to evildoers. On Saturday last he laid information against John Glasier, James Aube, Thomas Lavigne, Joseph Melanson, Thomas Glasier, Ambrose Doucet, Joseph Coutre, Jr., and Frank Hurst. Each of these parties were fined \$50 for hunting moose out of season, two months being allowed them in which to pay the same.

It is to be feared that no efforts to enforce the laws will prove effectual until the Government recognizes the dire effects of this deep snow butchery business and provides sufficient funds to employ an efficient force of wardens and detectives. It is certain that not one case out of fifty is ever brought to the notice of the authorities. My information is that in some sections of Maine the situation is not much better. A good many young men from

New Brunswick work in the Maine woods in winter, returning home in the spring. Some of these youths give a very circumstantial account of the killing of many moose and deer by the loggers in the Aroostook region. 'Tis a weary world.

FRANK H. RISTEEN.

FREDERICTON, April 8.

N. B.—Since foregoing was written, Surveyor-General Dunn has suspended Hanson for two months and fined him \$150 for shooting a moose out of season; in case fine is not paid at the end of two months, suspension to continue until it is paid.

F. H. R.

The Hunting Rifle.

Editor Forest and Stream:

I wish to make a rifle inquiry which has long been at my finger ends. That is, why is the double rifle shaped precisely like a shotgun, and about as heavy, so little known in the United States? To my mind there was never so really lovable a weapon in the world. Every time I read of a man in trouble with his rifle, I feel like writing to him and asking him if he ever saw a double hammerless express. Let me mention two or three constant causes of profanity to the North American big game hunter. Perhaps the greatest is the snow and ice in the gun locks, or the alternative sticking of the weapon in the gun coat at the supreme moment of the unexpected chance for a shot. Mr. Frederic Remington, in his recent article "The White Forest," in Harper's Magazine, tells it in a sentence: "We were led up hills, through dense hemlock thickets, where the falling snow nearly clogged the action of my rifle, and filled the sights with ice." No man can travel through snow-laden branches and keep a naked rifle fit for instant use. Neither can a repeater, with its peculiar shape, be relied on to come out of a cover at the first pull. A smooth-tipped hammerless will do so. Bear witness the old Sharps. The only thing that ever caught in the cover was the sight, and the peculiar shape of the modern double hammerless prevents this from catching.

But the greatest advantage about the double rifle is its instant second chance. Mr. Hough, in describing the virtues of the valiant John Munroe, in "Sheep and Snow-shoes," told how bravely that delightful mountain man stood his ground in the face of a charging grizzly, "when he knew he would have only one shot." The good Mr. Munroe was armed on that occasion with a big repeating rifle. The bear was skulking through the bushes, and when he came out like a raging jabberwock, a few feet away, there was no chance to work the lever. The situation was precisely that which tiger hunters face nearly always. And no sane man, I suppose, ever chose a repeater for tiger shooting. Where a very quick shot is required, no repeater, worked with a lever by the trigger hand, is ever quite quick enough. With a double rifle, as with a double gun, one can place two accurately aimed shots more quickly than with any repeater, and four shots as quickly. And the man who is preparing for his second shot as he fires his first—a habit which "repeaters" nearly all have—will not make so good a first shot as he will if he knows the second awaits only one other motion—a finger pull.

The best authority on the practical effects of rifle bullets with whom I am acquainted is that famous surveyor-guide, Mr. Henry Braithwaite, of New Brunswick. He has been present at the downfall of more moose during the last thirty years than any other man I know, and he has seen more moose depart for unknown localities, to the music of more kinds of rifles, in the hands of more kinds of men. He is as broad minded as the world, and can tell you more about the history of firearms than most gun makers can. He believes that the only weapon suited for big game shooting is a double rifle.

The small-bore smokeless rifle is unquestionably a great factor in the gun problem nowadays. This paradoxical arm has reversed the usual order of progress in firearms. Most, if not all, of the improvements heretofore have been made first in sporting arms, and then have slowly been adapted to the uses of the non-experts who make up the greater per cent. of armies. The small-bore smokeless is a distinctly military arm. Its greatest claim to the sportsman's respect is its long point blank. It practically eliminates the bullet's drop at sporting ranges. Its lack of driving, smashing force is the great objection to it. In the hands of very expert shots it often kills at once, because they place the bullets just where they do the most harm. A year ago I sat in a refreshment room in Boston with one of the surest rifle shots in this country, and he told me how he had knocked down a large moose a few weeks before with one shot from his pretty little .30 repeater. He said then that he believed any man who could shoot straight needed no better weapon. This fall FOREST AND STREAM recorded the fact that this gentleman, using the same weapon, hit his moose just where he wanted to, and the moose plunged away to an unknown deathbed, where its bones are now being picked by the gorbies and the minks. What we all want is a rifle with a long point-blank range, with paralyzing power at the end of that range. Discussing these things with Mr. Braithwaite, in front of a glorious winter fire, he said to me: "If there could be a double rifle of about .40 caliber with a heavy, soft-nosed bullet, and burning about fifty grains of smokeless powder, a rifle having about the smashing power of an ordinary .50 English express, it would be as good at 200yds. as the .50 is at 50yds., and would be the ideal hunting weapon."

I wondered if all the world was bound down to knitting-needle calibers, and made up my mind that there must be some maker who had sense enough to see the utility of such an arm. Sure enough, it is being sold in London, and is a great favorite in Africa and India. Another illustration of the fact that one-half the world does not know how the other half shoots. This .40 rifle burns fifty grains of cordite, fires a 400-grain bullet, and develops more striking shock than a .50, with as much penetration as a .45 government. A 24in. barrel is plenty long enough, and it seems to me that this hammerless double rifle, with the beautiful sights which always come on these artistically made weapons, is the ideal which combines all we know of sporting gunnery.

I have roughly calculated that the extra weights of the rifles I have carried, multiplied by the hours I have carried them, would lift the capitol of the greatest nation on

earth. The reason for this is the same as that which compels the dug-out to be thicker and heavier than the Peterboro' canoe. There is the same difference between an American repeating and an English double rifle. So far as I know, there is no American shotgun maker who also builds double rifles. But if every man who uses a twelve dollar rifle and a hundred dollar shotgun could handle a really artistic double express rifle, I am sure there would be an opening for a new rifle factory in the United States, or an encouragement to our American rifle makers to enlarge the lists of their models.

Uniformity of action between rifle and gun is also a controlling reason for having both alike. Any one who has fired at partridges and caribou the same day will testify to that fact. FREDERIC IRLAND.

CHICAGO AND THE WEST.

Troublous Times in Illinois.

CHICAGO, Ill., April 8.—Times are growing exciting in this vicinity just now. As matters stand to-day there is a reasonable show that a law will be passed which will leave Chicago market open the year round to outside game. A few sportsmen are fighting this possibility. The measure is already passed by the Senate, this being no less than the Senate bill No. 43, to which attention has been called in the last two issues of *FOREST AND STREAM*.

A warm meeting of those opposed to this measure was held yesterday afternoon. A still warmer meeting was held to-day at Warden Loveday's office. Warden Loveday complained bitterly of the unfairness of the attacks made on him by the press, instigated, as he thinks, by persons unfriendly to him. He accused sportsmen of lukewarmness and want of harmony in the handling of this bill. He resented all charges of being a tool of South Water street. In conclusion he expressed his willingness to agree with the request of the committee of sportsmen and to do what he could to yet save the chief working features of the law so far as selling game is concerned. He agreed to go to Springfield with the committee and work in the House for the passage of the amendment, which is the only thing asked by the sportsmen's committee. This he did freely, and declared that he had been ignorant of any such failure in the measure to cover fully the marketing features.

Considerable feeling was brought out at the meeting, as is usually the case where misunderstandings exist. If it be not yet too late, House bill No. 434, which corresponds to Senate bill No. 43, will be amended so that this market will not be open. This will leave Sections 2 and 6 of the old law practically unchanged, it is to be hoped, and will bring a fairly satisfactory issue out of the sudden and intensely interesting fight which has sprung up at the last minute over this bill.

Mr. Loveday insisted again and again that all he wanted was a bill which would protect the game, and he pointed out that his original bill had been very much altered since its introduction. The game farm is cut out. The non-resident license remains, reduced to \$10. The resident license was cut out, and this practically nullifies the intention of the original measure on this head, as all the collections of non-resident licenses would raise but a very small fund for protection in this State.

Should the bill pass both Houses without further change, we would have, instead of our old law, a most deplorable measure, with a wide open market, a half-way license provision, and no features which would make this law the superior of the old law. At this writing the issue is in doubt.

The sportsmen's committee, consisting of Messrs. F. S. Baird, R. B. Organ, W. P. Mussey, M. R. Bortree, George W. Strell and E. Hough, will all, or part of them, go to Springfield with Mr. Loveday Monday evening. It should be the prayer of every Western sportsman that they will meet with success. If they do not succeed, and if this market is, whether by accident or intent, left open the year round for the sale of game from other Western States, then Illinois deserves and should expect to have every Western State put a non-resident license clause on its statute books which shall prohibit any Illinois shooter from going outside of his own State to shoot.

In all the history of game law fights that I have known in the past ten years here, this is decidedly the most important as well as the most bitter.

The chief trouble in this disturbance has been over what at first sight appears to be a very slight matter. It is merely the omission from Section 1 of the new measure of the words "wild buck, doe or fawn, wild turkeys, pinnated grouse or prairie chicken, ruffed grouse, pheasant or partridge." These birds and animals were left unprotected by Section 1, and hence by action or Section 6, could be sold the year through in this market, Sections 10 and 12, mentioning all or part of these animals, having distinct reference only to Illinois game. Thus it will be seen that this little oversight meant the giving away of the whole market situation on the grouse of the Western country, which could be sold at any season. That means that Illinois birds could also.

The Meeting of Friday.

At the meeting of yesterday afternoon at the Sherman House, Messrs. Baird, Organ, Bortree, Mussey, Strell and Hough were present, the discussion for the most part being informal and on the subject of the omissions from Section 1, as above commented upon. Mr. Organ was at length finally asked to take the chair, and it was then formally decided to have the above men as a committee wait on Warden Loveday this morning as above mentioned. Mr. W. W. Ellis, formerly of St. Louis, but now of Chicago, was present. He said that he had an interview with Mr. Booth of the A. Booth Packing Company, who said: "We will kill any bill looking toward the hampering of the shipment of the sale of game. We intend to sell game here the year round, and we will use money in a fight to that effect." Mr. Ellis shed some light on the game market of St. Louis. He said that St. Louis is the great cold storage point, but that the St. Louis dealers look to Chicago as their market. He said that a great deal of Illinois game went to St. Louis from the lower part of this State, only to be shipped to Chicago

later on. He said that St. Louis would join with Chicago in the attempt to make this a wide open market.

Mr. Bortree at the meeting yesterday was of the opinion that sportsmen should not rest content with the changes to Section 1, but should also ask that the selling season be closed at Jan. 1. The majority thought it would be too late and too risky to ask that concession at Springfield now.

The Meeting of To-day.

At the meeting at Mr. Loveday's office this morning the following were present. Messrs. F. S. Baird, R. B. Organ, W. P. Mussey, George W. Strell, Mr. Bortree and E. Hough, of Chicago; Thomas Laffin, of Rock Island; William Harbaugh, of Geneseo. Mr. Loveday gives Mr. Harbaugh the credit of being the only sportsman to come and help him at Springfield.

Mr. Organ was asked to take the chair at the meeting, Mr. Strell acting as secretary. Mr. Baird, as at the meeting of yesterday, did most of the work in presenting the sportsmen's case, showing from the point of a lawyer the fatal defect of Section 1, and the bearings of Sections 6, 10 and 12. Before the meeting got at the work in hand, Mr. Loveday, with considerable emotion, spoke to those present. He said: "I want to say to you gentlemen that it would have looked a great deal better if you had come forward long ago with this matter. I have wanted to do only what was right, and I think it looks very badly to see these accusations in the newspapers, charging me with standing in with South Water street, or being their tool. If this bill is not right, I want to make it right. Five or six lawyers have told me that it was all right. It has been changed a good deal since first introduced. I want to show you that I am willing to do anything to get a good game law. I don't like this way of accusing me of wrong things in the public press. This thing was here and you all had a chance to come to Springfield and help, but you did not do so."

Mr. Organ said that he had received but one notification of a meeting on this bill. He had not had any copy of the bill at its recent stages. Others present also stated that they had not received the copies of the bill as earlier printed. Matters were rather at sword's points for some time, Mr. Loveday seeming to smart under what he thought was a persecution, and Mr. Baird insisting that he knew this measure was wrong, that he intended to fight it and to beat it as he had similar measures for the last eight years. The atmosphere cleared a little at the milder suggestion that perhaps Mr. Loveday would be willing to settle the whole business by agreeing to the insertion in Section 1, of the names of animals and birds which had been omitted. It was, however, some time before this came to a form of resolution. Mr. Strell at length moving that the meeting present to Mr. Loveday the resolution of yesterday, and that the committee attend Mr. Loveday to Springfield. Asked if this would be personally agreeable to him, Mr. Loveday replied:

"Certainly, I will willingly and gladly agree to this. I have never understood that this flaw existed, but had supposed the lawyers had covered every possible point." The gist of the meeting this morning is covered by the following resolution, which was adopted:

"Resolved, That the following names of game animals and birds and closed seasons for same, be added to Section 1 of House bill No. 434, and that we ask the Senate to concur in same in Senate bill No. 43; viz.: Wild buck, doe or fawn and wild turkeys, Dec. 15 to Sept. 1; pinnated grouse or prairie chicken, Oct. 1 to Sept. 1; ruffed grouse or partridge, Dec. 20 to No. 1."

The above is what we ask. What we get is something at present unknown. If the above amendments can be made to the House bill, we shall save Sections 2 and 6 of the old law, which have gone to the Supreme Court. Even so, with the rest of the law passed, as shown in the text as above printed, we have some experiments and a few possibilities. We do not gain the right to search without warrant. We do not take one step forward in the restriction of the marketing of game. We do not abolish spring shooting. We do not go forward one step on co-operation with our sister States. Under this law as under the old law, Chicago presents a sinister front to the sportsmen of the West. If this amendment be not passed, and if this market be thrown wide open the year round, the menace to the game of the West is open, deliberate and glaring.

Senate bill No. 43 was passed yesterday afternoon. It is, perhaps, in view of the complications in this matter, important enough to warrant printing in full the sections under discussion. Let readers pay special attention to section 1, and not the omission of mention of the animals and birds stated above.

Sec. 1. It is hereby declared to be unlawful to hunt, kill, net, entrap, ensnare or destroy, or to attempt to hunt, kill, net, entrap, ensnare or destroy, or to have in possession any quail between the 20th day of December and the 1st day of November of the succeeding year, or of any woodcock or mourning dove between the 1st day of December and the 1st day of September of the succeeding year, or of any gray, red, fox or black squirrel between the 15th day of December and the 1st day of September of each succeeding year, or of any jack snipe, Wilson's snipe, sand snipe or any kind of snipe or any golden plover, upland plover, yellow legged plover or any other kind of plover between the 25th day of April and the 1st day of September of each succeeding year, and it shall be unlawful to kill, hunt, destroy, ensnare, entrap or attempt to kill, hunt, snare entrap or otherwise destroy any wild goose, duck, brant or other water fowl at any time between the 15th day of April and the 1st day of September of any year. And it shall be unlawful to hunt, kill, trap, ensnare or to attempt to hunt, kill, trap, ensnare, or otherwise destroy any wild goose, brant, duck or other water fowl from any fixed or artificial ambush beyond a natural covering of reeds, canes, flags, wild rice or other vegetation above the water of any lake, river, bay or inlet, or other water course wholly within this State, or in such part of such stream or water course wholly within this State, or with the aid and use of any device commonly called sneak boat, sink box or other device used for the purpose of concealment in the open waters of this State. And it shall further be unlawful to shoot, kill or destroy or shoot at any wild goose, duck, brant, or other water fowl with a swivel gun, or from any sail boat, electric launch or steam boat at any time in any part of the water of any lake, river, bay or inlet or other water course wholly within this State, or in that part of such stream or water course wholly within this State; any person so offending shall, for each and every offense, be deemed guilty of a misdemeanor, and, on conviction, shall be fined in any sum not less than fifteen dollars nor more than fifty dollars and costs of suit, and shall stand committed to the county jail until such fines and costs are paid: Provided, that such imprisonment shall not exceed ten days, and the killing of each bird or animal herein specified shall be deemed a separate offense.

Sec. 2. It shall be unlawful for any person to buy, sell or have

in possession, any of the animals, wild fowl or birds mentioned in Section 1 of this act, at any time when the killing, trapping, netting and ensnaring of such animals, wild fowl or birds shall be unlawful, which shall have been killed, entrapped, netted or ensnared, contrary to the provisions of this act. And it shall further be unlawful for any person or persons at any time to sell or expose for sale, or to have in his or their possession for the purpose of selling, any quail, pinnated grouse or prairie chicken, ruffed grouse or pheasant, gray, red, fox or black squirrel, or wild turkey, that shall have been caught, ensnared, trapped or killed within the limits of this State. And it shall further be unlawful for any person, corporation or carrier to receive for transportation to transport, carry or convey any of the aforesaid quail, pinnated grouse or prairie chicken, ruffed grouse or pheasant, squirrel or wild turkey that shall have been caught, ensnared, trapped or killed within the limits of this State, knowing the same to have been sold, or to transport, carry or convey the same to any place where it is to be sold or offered for sale, or to any place outside of this State for any purpose, except such person have a license from this State so to do. And any person guilty of violating any of the provisions of this section shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be fined not less than twenty-five dollars nor more than one hundred dollars for each and every offense, and shall stand committed to the county jail not exceeding ten days until such fines and costs are paid: Provided, that the selling, exposing for sale, having in possession for sale, transporting or carrying and conveying, contrary to the provisions of this section, of each and every animal or bird forbidden herein, shall be deemed a separate offense.

Sec. 6. No person or persons shall sell, or expose for sale, or have in his or their possession for the purpose of selling or exposing for sale, any of the animals, wild fowls or birds mentioned in Section 1 of this act after the expiration of five days next succeeding the first day of the period in which it shall be unlawful to kill, trap or ensnare such animals, wild fowls or birds; nor shall any of such animals, wild fowls or birds be sold or offered for sale during the first two days of the open season. Any person so offending shall, on conviction, be fined and dealt with as specified in Section 1 of this act, and selling or exposing for sale, or having the same in possession for the purpose of selling or exposing for sale, any of the animals or birds mentioned in this section, after the expiration of the time mentioned in this section, shall be prima facie evidence of the violation of this act: Provided, that the provisions of this act shall not apply to the killing of birds by or for the use of taxidermists for preservation either in public or private collection, if so preserved: Provided, further, that nothing contained in this section shall be construed as modifying or being in conflict with Section 2 of this act, or authorizing or legalizing the sale or exposing for sale, transportation or receiving for transportation, any of the animals, birds or game as therein prohibited: And provided, also, that the inhabitants of villages and cities may receive game from other States, and expose and sell the same on the market in said villages and cities, between the 1st day of October and the 1st day of February of the following year.

Sec. 10. That it shall be unlawful for any person or persons in the State of Illinois, for and during the period of five years from and after the passing of this act, to injure, take, kill, expose or offer for sale, or have in possession except for breeding purposes, any wild buck, doe or fawn, wild turkey, ring-neck, Mongolian pheasant, any green Japanese pheasant, English pheasant, any copper pheasant, or Scholmeringom, any Trogapan pheasant, silver pheasant or golden pheasant, any Cucubus, any chucker partridge, and sand-grouse, any black India partridge.

Any person violating the provisions of this section shall be deemed guilty of a misdemeanor, and upon conviction shall be punished by a fine of not less than fifty dollars, nor more than one hundred dollars, and in default of payment of the fine imposed shall be imprisoned in the county jail at the rate of one day for each dollar of the fine imposed. The one-half of all fines imposed and collected under this act shall be paid to the informer and the balance shall be paid to the game propagation and protection fund.

Sec. 12. It shall be unlawful for any person, except during the month of September in each year, to injure, take, kill, expose, offer for sale, or have in possession, except for breeding purposes, any pinnated grouse, prairie chicken, any ruffed grouse or partridge, that shall have been killed or taken in the State of Illinois: Provided, such birds may be killed with a shotgun during the month of September only.

Any person violating the provisions of this section shall, on conviction, be fined not less than twenty-five dollars nor more than one hundred dollars, and in default of payment of the fine imposed shall be imprisoned in the county jail at the rate of one day for each dollar of the fine imposed until the fine is paid.

After carefully reading the text of the above bill and noting the omission to protect grouse and other animals in section 1, let the reader follow on to section 6, where it says: "No person or persons shall sell, or expose for sale, or have in his or their possession for the purpose of exposing for sale, any of the animals, wild fowls or birds mentioned in section 1 of this act." Now, the following animals or birds are not mentioned in section 1, viz., wild buck, doe or fawn, wild turkeys, pinnated grouse or prairie chicken, ruffed grouse, pheasant or partridge. They are therefore outside the prohibition to sell. It is plain as the nose on your face.

Section 10 offers a five years' close term, which is good, covering certain birds.

If the reader will now turn to section 12, he will find that ruffed grouse can, under the new measure, be shot only during the month of September. This is, of course, a sporting absurdity. The sportsmen's committee suggested that the date on ruffed grouse be made the same as on quail.

Mr. Loveday in Refutation.

The Packer and National Produce Review, in its last issue continues its attack upon Warden Loveday, attempting to cite cases in which suits had been compromised on South Water street. The Review makes no case, since it succeeds only in landing big charges against subordinates of Mr. Loveday. It admits that the warden is not at fault in the matter of turning over funds to the School Board, since that is the duty of the Justice of the Peace and not of the warden. Mr. Loveday dictated the following statement for a city paper:

"In answer to the charges made against me by the South Water street commission merchants last week during my absence from the city, I have to say that there is absolutely no truth in those statements. I have not, directly or indirectly, received one cent in connection with my duties as game warden, except as provided by law. I would state that during my first year as game warden I secured 548 convictions for violations of the game laws and was defeated in but three cases. Of this record I am proud, and am willing to stand before the people on it. Relative to the disposition of confiscated game, I will say that sales were made after due process of law, and that I received from the different courts in the State only the amount allowed me by law. I have not received or receipted for any money that rightly belongs by law to the school funds. There were many cases brought in the name of the people by persons unknown to me for violation of the game law, of which I have no knowledge or record.

"My work has naturally taken me all over the State, making it impossible for me to have personal supervision of suits brought or seizures made either by strangers or assistants. I am now making an investigation to ascertain whether or not anything has been done contrary to law. Quantities of game were seized during the season, a large part of which was totally unfit for food and which was condemned and destroyed, and I still have in cold

storage many birds, the product of seizures, which will be disposed of at public vendue when it is lawful under the statutes for the same to be sold, at which the sales will be made as usual by an order from the court after due notice and advertisement.

"I further say that I only want the support of men who are honestly endeavoring to protect game in Illinois and to enforce the game laws, and do not expect support from commission merchants in Chicago and elsewhere, whose whole desire seems to be to violate the law. I do not keep tab on either judge or justice, as I do not consider it any of my business so to do."

I saw Mr. Loveday this morning and asked him to make a statement for the FOREST AND STREAM, and he replied that he had already done so. He regretted that I had "gone to South Water street, and had not come to him." If he will refer to issues of the FOREST AND STREAM of April 1 and April 8 he will find that I have not been to South Water street at all, and, indeed, for a month have been away from my office unable to see anyone. The matters of news printed in any paper are public, and must be regarded thus in spite of any personal preference one way or another. If Mr. Loveday will give special heed to my story of April 8 he will see the suggestion that the South Water street paper should produce facts and not general assertions. If this paper will produce such facts, showing corruption in the office of any game warden, the matters will be public property, and will be printed as public news; but they will not be used in FOREST AND STREAM until they are known to be facts. I would repeat that if the Produce Review, from its acquaintance with the trade, can bring to light any of the nefarious ways of South Water street, I shall fall upon the news joyfully. Mr. Loveday to-day stated that he had no intention of following up the charges made in the paper above referred to. He called attention to the fact that he had taken game from almost every house on the street, and had seized more game than all his predecessors together. He said he thought a game warden ought to work out in the State as well as on South Water street.

We are having a warm time here, as may be seen, but I imagine it will cool down after a while, the more especially as I hope to see section I amended through the action of the sportsmen's committee above named.

In Gokey's Country.

In a letter dated March 16, from our friend Gokey, of Dawson, N. D., he reports the appearance of the first northbound wild geese, and said that he was looking over the old gun, with the intent of going out to see what he could do. Mr. Gokey says that there was very little snow in his section this winter and that the grouse wintered well. He has spent the long days of the past winter in hunting wolves, but he has a grievance against State Warden George E. Bowers. It seems that the latter was out with Mr. Gokey not long ago on a wolf hunt, when the dogs ran into and threw a big wolf. Mr. Bowers got out with a club and undertook to kill the wolf, but "landed good and square" on one of the dogs. They took the dog home in the sleigh, and at last accounts they thought he would live. From all accounts life in Dakota is not without its incidents.

Speaking of the northbound wild geese reminds me that I heard the familiar honk this morning myself for the first time this season. A good flock of geese passed over the city near where I live, and through the open window I could hear the wild music. There is a certain thrilling quality to the note of the wild goose in the spring which I imagine has been acknowledged by every one who has heard it, whether he be sportsman or not. When the geese go streaming over, men and women alike look up and listen.

Getting Ready for Spring Trade.

Jack Monroe, out on the Blackfoot reservation, seems to be getting ready for the spring trade in bear. He writes me that he has about thirty carcasses of horses which have been killed by the railway trains, besides bulls that died in the Government bull herd, all of which he says can be favorably placed with little trouble, so that he thinks he could take care of a number of spring bear hunters. Jack has been away down in New Mexico with Mr. Pinchot, of New York, after bear. They found quail, deer and antelope, but no bear. I should think the latter were probably holed up.

More Spring Trade.

The members of Kinne Creek Trout Club, or more properly the Flint and Pere Marquette Club, are beginning to think about their spring opening. A party of them will start to-day from Saginaw and go up to the club preserves. The annual meeting will be held at the club house, or on the special car "W. B. Merston," which carries the party. Then the nursery ponds will be drained and the yearlings will be transported over to the proper streams. There will be about a dozen in the party, including Messrs. Keena and Avery, of Detroit, who were at Saginaw yesterday, guests of Mr. Humphrey. I can imagine it will be a very happy and energetic party that will superintend the early spring opening of Kinne Creek millinery. This is a wonderfully fortunate and well equipped trout club, and its personnel cannot be duplicated.

Nets in Fox River.

It is cheering to learn that at the present writing the Illinois River is full of nets at the mouth of the Fox River. The mouth of the latter stream is cut off by a series of wing nets and fykes, which will no doubt stop the bulk of the spring run which would naturally go up that stream.

E. HOUGH.

1200 BOYCE BUILDING, Chicago.

Take inventory of the good things in this issue of Forest and Stream. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

The Illinois Game Bill.

CHICAGO, April 1.—*Editor Forest and Stream:* An article which appeared in the FOREST AND STREAM of this date (p. 246), signed E. Hough, seems to have been written by some one who was misinformed. For instance, it says: "The first and great objection to the measure (Senate bill 43) is that it sweeps away entirely our old game law. In this old game law we have taken sections 2 and 6 to the Supreme Court," etc.

Now the fact is patent, from a casual glance at bill 43 and "the old game law," that but two words have been added to section 2 of the old law, and two words changed, and the changes in section 6 are so trifling, and yet so pertinent, that if Mr. Hough will read sections 2 and 6 of bill 43 and sections 2 and 6 of the old law he will wonder why he wrote the article.

Section 6 of bill 43 and of "the old law," in so far as they relate to the sale of game, are identical, and Mr. Hough is unnecessarily perturbed when he says prairie chickens can be sold the year round.

If the Packer and National Produce Review was less obscure it might call for vigorous action, but it does not seem to have emerged sufficiently far from the shadow of egg cases (frequently filled with contraband birds) to have become really visible.

The South Water street law-breaker knows full well that there has been no favoritism shown in the matter of seizures of game which had been illegally shipped, and the thorough organization which they have against bill 43 is the best evidence that they are not in sympathy either with the game warden, with bill 43, or any other statute which restrains or prohibits the sale of game.

Mr. F. S. Baird, recently a judicial candidate, and Mr. M. R. Bortree, an ex-game warden, are men who clamor for the retention of sections 2 and 6 of the old game law,

HEAD OF VERMONT MOOSE.

Killed in 1899.

which are identical with sections 2 and 6 of bill 43, with the exception of a few words added in bill 43, which serve to make said sections practically operative for the protection of game.

Mr. F. S. Baird was repeatedly invited to assist in the framing of bill 43, but excused himself on account of press of business; nevertheless he was interested enough to request me not to change sections 2 and 6, because we had obtained a Supreme Court decision, also adding that he was the party that framed those sections. In spite of this, Mr. F. S. Baird's letters have appeared in the Senate at Springfield, claiming that bill 43 (a copy of his own bill) is a South Water street bill. Just such work as this has kept Illinois back from advancing in the protection of game for the last sixteen years. It is simply a dog-in-the-manger case, and it is full time now the real lovers of game and bird protection should take off their blinders and see the facts.

H. W. LOVEDAY,
State Game Warden.

[The date of this letter shows that it was written before the meeting of April—reported above by Mr. Hough.]

Adirondack Wolves and Deer.

CHIEF PROTECTOR POND writes to the Saratogian:

"I am very much surprised that the old guide (Forten, better known as Old Chauncey Hathorn), claiming to have so much knowledge of the condition of the woods generally, would admit, as he did, that a few wolves now exist over in the Moose River country, which statement is anything but the truth. I am ready to forfeit \$100 for every wolf or sign of one that can be found to-day in the Adirondacks.

"The statement that I made, which appears in the Malone paper, that deer are unusually plenty near the outskirts of the woods is true, and it is not a fact that deer must seek the center of the Adirondacks in order to winter, as there can be readily found within a mile or two of the border of the woods plenty of large swamps with evergreen thickets that furnish the best of shelter and protection from the storm for deer, and gives them an opportunity to take advantage of the early vegetation about the outskirts of the woods, which starts two or more weeks earlier than it does in the more dense forests. From this statement I do not wish to be understood that deer cannot be found in the more dense forests, but wish to convey the idea that they have increased so rapidly in the past two years that they must have larger fields to roam in."

He also writes to the Malone Farmer: "I note that you made some comments on a statement which the exchange claimed was made by me, to the effect that wolves inhabit the Adirondacks at the present time. Your criticism of this statement was perfectly just, as I have been misquoted. Some time since, when appearing before the Committee on Fish and Game of the Assembly, I made

a statement which cannot be justly denied: That in the past two years under the anti-hounding law, deer have increased 50 per cent. or more, and that deer were more plenty to-day than they have been in the lifetime of the oldest inhabitant residing about the Adirondacks. This statement was questioned somewhat, and when asked for an explanation, which I gave, was at the time the question of the wolves came up. I explained to the committee that from 1850 to 1870 wolves had been very numerous and had so exterminated yard after yard of deer winters, when there came a deep snow with crust, that they did not commence to increase until the wolves had been so exterminated for the sake of the large bounty the State and counties paid, which did not fully occur until late in the eighties, and in fact one wolf was caught in a trap at Brandreth's Lake, in Hamilton county, six years ago, which is believed to be the last wolf left in the Adirondacks. As the wolves began to the scarce about 1870, the deer began increasing, but from that time till 1880, when an act was passed prohibiting the transportation of venison, hundreds of deer were killed about the Adirondacks and shipped to market. One would see not only carloads of venison along the different roads that circle the Adirondacks, and only for the prohibition by the law of 1888 of shipping venison, it would have been only a matter of a short time as to their extermination.

"After 1888 deer began to increase quite rapidly, but, as the advantages for getting into the woods became so much greater by the addition of railroads, and the great increase in the number of people who were becoming fond of the sport of hunting with dogs, together with the improved firearms, the statistics of 1895 and 1896 showed such a wholesale slaughter—over 10,000 deer being killed in the two years—that people who had always favored hounding, myself not excepted, who had an interest in the Adirondacks and objected to seeing the deer become exterminated as have the buffalo on the prairies, were willing to deny themselves the pleasure of hounding, urged the present law, which prohibited hounding. Deer could be found at any time this last fall in small pieces of wood remote from the main wilderness, where they hadn't been known to exist in very many years. They could also be found in the heart of the woods, where thirty years ago they were scarce on account of a slaughter by wolves.

"By having alluded to the wolves in the remarks I made to the committee, about on the line of this communication, is how the matter came up, and regarding which I was wrongly quoted. It is a pleasure to know that where hundreds of hounds could be found two years ago in back settlements, lumber camps and little hamlets which had sprung up by reason of the large lumber interests that have been established in many localities, that scarcely any can be found at the present time, and the people interested in the welfare of the deer need not fear that when deer have yarded on the outskirts of the woods they will be chased to their death when in the weak condition they are always found in the spring of the year, by a hungry pack of hounds, whose owners do not think it worth while to keep them in chains."

One of "The Best Books of 1898."

FROM the list of 4,332 books published in 1898, 500 were selected by the New York State Librarian; and of these 500 the librarians of public libraries in cities and villages throughout the State were asked by the State Librarian to vote for the fifty books considered best for the uses of a village library. Among the fifty chosen is the "Book of the Boone and Crockett Club, Trail and Camp-Fire," edited by Geo. Bird Grinnell and Theodore Roosevelt, and published by the Forest and Stream Publishing Company.

Of "Trail and Camp-Fire," the University of Toronto Review of Historical Publications relating to Canada, says:

"The chief contribution to the volume, from a Canadian standpoint, is Mr. Low's paper on Labrador. He begins with an historical sketch of the various expeditions of discovery and exploration that have traversed the country. The Norsemen and John Cabot are boldly claimed as the earliest European visitors. In the geographical description of the peninsula that follows, the author gives an agreeable summary of information which is contained in greater fulness of detail in his official reports communicated to the Director of the Geological Survey of Canada, and printed in the reports of the latter for the years 1896-97. The bulk of the article is, however, devoted to a description of the various animals and fish that are the object of the sportsman, and in this connection some valuable information is given as to means of travel and necessary equipment. He relates a curious instance of nature's vengeance, in explaining that great slaughter of caribou by the Indians in one year means the disappearance of the animal from those regions the next, with the consequence that the Indians die of starvation in large numbers. Another cause of temporary scarcity of game is the destructive forest fires, which sweep away the coverts and food of the woodland caribou. There appears to be great fluctuation in the size of the herds of deer, but they increase very fast under favorable conditions, and there should be no danger of extermination with such vast tracts of unknown wilderness to roam over. The main attraction of Labrador for the sportsman is its fishing. The rivers flowing into the Atlantic and Hudson Bay are breeding grounds for salmon no less than the rivers flowing into the Gulf of St. Lawrence, but no adequate protection has ever been given to the salmon in the region under jurisdiction of Newfoundland, and the cod fishermen have ruined the salmon fishing by 'trapping' them. The ouananiche, which Mr. Low considers to be the original salmon, of which the sea-going salmon is a 'sport,' is found in many of the Labrador lakes and rivers, and brook trout of appetizing size are also mentioned. Travel is evidently very arduous work in the peninsula; canoeing in summer and walking in winter are the only means of traversing the country, and the difficulty of keeping an expedition supplied with food is very strongly emphasized."

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

In the Flatwoods of Florida.

DOCTOR and I left Auburndale one morning for Brown's Clearing, near the headwaters of the Withlacoochee, and in a flatwoods region which Sike had reported to us as overrun by "sky-oodles" of game, a forceful statement that aroused anticipations by its vagueness. Sike, Drury, and Drury's son George, three seasoned knots of hunting timber, were to meet us at the end of our journey and pilot us about through the most confusing section of the forest in the central part of the State.

Knowledge of where deer were to be found was necessary to insure a successful hunt. Existing local conditions affected the movements of game. Favorable possibilities were likely to be inversely proportional to the amount of previous hunting that had occurred in various parts of the wilderness and directly commensurable with the supply of forage. Frequently we were compelled to traverse great distances that we might secure meat, but on a few occasions we discovered it almost at our doors. Our hounds started four deer one morning while I covered a nearby stand, from which I could hear distinctly the crowing of chickens on surrounding farms. Sike spent much of his time in the woods and could supply us with valuable information at any time concerning the whereabouts of the game.

The twenty-five-mile trip from Auburndale to the flatwoods was a panorama that changed gradually from brilliant attractiveness to sombre impressiveness as we passed from the home surroundings of lake and pine forest, glorious under the morning sunlight, into a region of great cypress swamps that were stupendous in the gloom caused by an overcast sky. The accumulating of clouds during the journey gave the landscape at times only prettiness, at others radiant beauty, at others a dark sublimity. The forest in the changing lights was grand.

We stopped about 2 o'clock to eat dinner near the well of a meeting house. The 30 by 50 ft. structure stood on the last pine ridge fourteen miles from town. The rough lumber used had probably been hauled from the mill a few miles back on the road, and the work performed by the congregation. Such a building was as sermon in itself and gave a religious aspect to that part of the wilderness. Indeed, as we sat there the small house of worship assumed proportions that seemed to encompass the civilized world.

Pleasant visions of rural devoutness were suggested to us as we lunched. The logs at the crossing a short way back on the road had been worn bare by the feet of pedestrians. Fodder scraps and corn cobs under trees near the well indicated that many people came here on preaching Sundays either to stay or from a long distance. Patriarchs had tramped bare spots on each side of the single step as they lit up the entrance with their beaming visages. Those nests of whittlings under shady trees revealed character. Artists who had worked with a free bold hand had cast shavings far and wide, while those who had wrought with care had accumulated their waste into diminutive heaps. There was an object lesson in these remnants of wood-carving.

Open pine forest surrounded the church. The contour of the ground on both sides of the doorway sloped to low country, where there were glimpses through the forest of lagoons extending to gray cypress swamps. There were a number of places within sight where our hounds had started deer. Perhaps the older members of the congregation, even, while gazing out those windows, have thought up reminiscences to tell afterward out by the whittlings. Perhaps forest-born Nestors cannot throw a shaving and wiggle a beard—well, perhaps.

The road from the church to the clearing led by only one house, a log mansion overtopped on the door side by a cluster of enormous bananas. The small patch of growing cane in the far corner of the lot added by its fresh green color to the attractiveness of the little home. A large covey of bare-legged children followed their mother as she approached the bars to answer our inquiries in regard to the way. Some of these youthful wood nymphs stood about as mute statues, some of them twiggled their finger, some of them dug holes in the sand with their big toes, but all of them scrutinized us with a penetrating glare hard to face, while their mother responded to us in tones that were full of either half concealed pathos or partly veiled humor. Perhaps the blank faces of that family veiled a lively glee at my coming to the woods arrayed in collar and necktie. My slight effort at adornment may have been a source of amusement to these new friends for days afterward.

We had hardly recovered from the stare of those children when we met the mail carrier. These officials are almost the only representatives of government in that part of Uncle Sam's dominion. As I had spent a number of years in an office directly across the street from the Post Office Department at Washington, the sight of this man of the leather sack was reassuring and caused me to feel that home was not so far away after all. The reach of our dear Uncle Samuel is wonderfully long when he would gather in his mail items. No doubt his aged servant on the cart drawn by the rat-tail pony felt burdened with great responsibilities as he pursued his way bumped by primitive roots through the lonely wilderness.

Our three friends did not arrive at the rendezvous till after nightfall. Our meeting place was uncheerful. Ruins that stand in bleak surroundings and show advanced decrepitude become inspired architecture when viewed by day, but that broken-backed house and those upset outbuildings were horrible after night. Black streamers of moss draped every possible lodging place. The rattling of dry weeds might have been a dirge of old bones. The forest near the clearing mourned dolefully. The most cheerful camp-fire would have only danced spectres in the terrible windows of that forlorn building. The howling of a dog about those premises would have immediately ended our hunt. We established camp some distance down the road to secure better water facilities. We tried not to think that night when our fire went out what the clearing would have been under such conditions.

Our party spent the evening around a cheerful blaze of light wood. Sike told yarns. There was a story of a garrulous uncle who, while sitting by the fire at night, talkative, as usual, had discovered that what he had mistaken for a pricking briar was in reality a biting "ground

rattler" on which he was sitting. Snakes were the topic of conversation. While I listened I was impressed with the difference between our situation and camp-life at the North in February. The weather had become oppressively warm and our fire was only preserved for ornament. A shrill chorus of katydids contradicted each other in the nearest foliage. A sultry autumn night seemed to have closed in upon us. Across the water-hole in the cypress swamp, where the owls were hooting, there were occasional rushes of wind that were afterwards responded to by the pine tops immediately above our camp. Evidently a storm was brewing.

The following morning day broke to disclose a dripping wilderness. When we had eaten breakfast we set forth in the rain with considerable reluctance to explore the adjacent forest; but once our trousers were thoroughly saturated with wading we marched gaily on regardless of consequences. Our courage may have discovered an incentive in the fact that the country through which we traipsed was the scene of many heroic deeds during the Indian wars. The woods within the vicinity of camp covered slightly rolling land and great flats. Numerous diverging swamps cut up the neighborhood into a maze that was confusing on a cloudy day. Indian fighting must have been exasperating to the highest degree where the natural conditions were so unfavorable to the white troops.

The low sandhills traversed by us were stories of game life written in tracks. The turkeys had been especially active in recording their movements. These fowls had gathered at one point as if for a sociable and had then scattered in every direction. Another gang had fed widely for a distance, then had closed ranks and finally had dashed off with sand-digging strides, a race in which two sets of large feet had persevered with great steps long after all the other tracks had turned into the nearest swamp. Hills where deer had written chapter were even more interesting. Sike, who had an opinion in regard to scribes, shot a buck deadlier than Homer.

The rainy morning was succeeded by windy clearing weather. Camp was moved during the afternoon to a point six miles south of the clearing. The riding was over palmetto roots and through flooded swamps, where submerged logs shook at the wheels to break our suffering backs. The dogs flushed a number of turkeys on the way, but we paid little attention to them. We had been drenched by rain, blown at by wind, and bumped by riding till ardor was dead.

Blanket couches spread around the fire were comfortable that night. Chilly blasts assailed us and then passed off through the large timber near camp. It was pleasant to rest out there by leaping flames that revelled in quantities of fat-wood, and to gaze above at vast star regions. Whiffs of fragrant pine smoke came at us and teased our throats and eyes. Sike wept copiously while recalling the happy past before railroads, and we wept with him. Drury and George concealed their emotion in a hand-to-hand struggle with a double-ended provision sack, an invention of their own, and the constant overhauling of this novel "comfort bag" provoked hot family disputes that were emphasized by kicks on Leader, their tamest hound. The nimbleness of the father's boot was remarkable.

Leader, however, wreaked vengeance on us the next morning for all the ill-treatment he had received, by arousing our expectations to an intense pitch and then leading us senseless races after frightened cattle. But the scenery was beautiful. Some of those sunny flats with hardly a tree on them were almost like burnished gold. As the heat became more intense they were enveloped in a brilliant haze of refracted light. Dark swamp foliage and high gray walls of mossy cypress timber formed background for these fields of brightness. Leader, with all his tricks, could not make the hunt barren of pleasure.

Drury, son George and I in the afternoon shaped our course directly back from camp, while Doctor and Sike bore away to our left. We had scarcely lost sight of them in the open forest when we heard the reports of their guns and the outcry of their dogs. A noisy chase then paralleled our course to cross it a mile ahead and enter a large swamp on the right. The hounds with us left, shouting vociferously, and my companions rushed ahead, to leave me where my heels blazed a trail over palmetto roots. Drury and George turned at a point far in advance to glide away toward the swamp, and when I arrived at the place where they had changed their course I found a road and saw shortly afterward all of our hounds racing headlong through the forest beyond.

My role amid so much excitement seemed to have become a minor part. While I was strolling down the road leisurely in the direction my companions had gone, I came within sight of George wading back and forth at an overarched crossing, from shadow to sunlight, with his hat at times a flashing helmet, and I halted a few hundred yards away from him to await future developments. The hounds had turned beyond us and were coming back, their musical voices varying with the acoustics of the forest, tones that played upon my excitement till I could have danced, little dogs with high-pitched voices doing treble, big-mouthed Leader and mate doing bass, and on they came, such a chorus, and oh! oh! but how I did enjoy deer hunting!

The excitement increased. Drury or George must shoot in a moment. I relaxed my nerves to receive the concussion of an overcharged gun. Would they never shoot? Then I saw, 40 yds. to the left of George, a bounding shadow approaching swiftly by an erratic course through the waist high palmettoes, and wondered that my friend, who had been guarding his stand so diligently, did not perceive his chance. Would he see it? Ought I to shout? It was a pity for him to lose such an opportunity. But in a moment the animal was almost within range of my gun. An instant afterward it was not 60 yds from me. Then there was the briefest period of unsteady aiming, a nervous snatch at a trigger, followed by the roar of my gun, a few alarming leaps of an expiring buck, and the venison was mine.

George, who had startled ludicrously at the unexpected detonation of my gun, approached to receive the particulars of the killing. Drury came in soon afterward. Then Doctor and Sike appeared. And after my recital each of them remarked, "Well, I'll be durned," till constant reiteration of this sentiment by my friends made

me wish that they might be "durned" if punishment of such kind was not extremely severe. Even the dogs were skeptical and nosed around to see if I had really shot their deer, the most intelligent hound even going back some distance to run over the trail. But the evident astonishment of men and dogs was only so much delightful incense to my exulting vanity, beatitude which was not diminished in the slightest degree by the fact that two deer had been started and Doctor had shot the mate to my stag. Surely there was glory enough for all of us.

That last night of camp-life under a canopy of so many scintillating stars, all of them undoubtedly our lucky ones, was an appropriate ending of our brief sojourn in that beautiful Southern flatwoods, where existence was a dream of Lotus-land. Charmed by a witch of a fire, exhilarated by breathing resinous air that was ambrosia, while we raked sweet potatoes from beneath the ashes and lubricated them with butter, we felt that it would not be altogether horrible if the lovely night should last forever. The tenderloin steaks from the deer, the bread toasted around the fire, the fragrant coffee made in tomato cans, all were delicious after our day of severe toil. To-morrow we should return to civilization, so we made the most of this last evening in our earthly paradise, and the most under such favorable conditions meant an exceedingly great deal. Prolonged existence out in the woods, encompassed by so many luxuries, would eventually result in ideals of living scarcely above those of dog life, and that is why no man, even the native, may camp out there forever. II. R. STEIGER.

A Staten Island Gull Shooter.

PRINCES BAY, N. Y.—*Editor Forest and Stream:* On March 31 a person came in from the vicinity of Great Kills and landed at Fitzgerald's Excelsior Hotel; he had with him two ducks such as some people call old wites, and also a sea gull in his possession. There was some discussion later on as to the propriety of this man having a gull in possession. I understand that the gentleman in question is a very prominent member of the League of American Sportsmen, who lives on the north shore; and if such is the case let no one think that he would be foolish enough to overlook Sec. 83, Game Laws of the State of New York. But really there are quite a number that would like to have the number of his certificate. A. L. H.

Camp-Fire Flickerings.

"That reminds me."

In a recent issue of your paper I read an article in reference to the effect upon the eyes the sight of wild animals sometimes occasions, causing them to greatly magnify the object. As I read this seemingly ridiculous statement an incident which occurred in my youth was recalled to mind.

In front of the old farmhouse where I was born was a mowing field of some ten acres. This field was divided by a stone wall, under which was for many years the den of a woodchuck. The clover in the immediate vicinity afforded ample food, making it an excellent home for the animal.

One day when I was about ten years old the family, consisting of my father, mother, two sisters and myself, were sitting on the front doorstep. A big woodchuck was observed in the field feeding, and at quite a distance from the wall. Suddenly it occurred to me that I could get to his den before he could see me by creeping from behind the wall and head him off. Informing the folks of my intentions, I procured a good-sized club in the woodshed and crept out the back way and down the opposite side of the wall to an apple tree, where I knew the hole was located. Then I carefully looked over and saw the groundhog feeding as before, except at short intervals, when he would sit up straight and look about. Everything was working as I had planned. The spectators at the door were deeply interested, and I fully intended to make the final climax startling. Quickly climbing over the wall, I planted my bare feet upon the little mound of earth which had been thrown out in excavating the den. I stood there a moment, cudgel in hand, before the woodchuck caught sight of me. I did not wait long, and when he did see me came straight as a bullet from a gun, and it seemed to me he grew larger at every bound. When he got within 50 ft. he was as big as a Newfoundland dog, and with three jumps more he looked like a bear.

I knew the folks at the house were watching me, and expecting surely I would hold my ground and smash that woodchuck when he got to me; I knew I would be laughed at, but I thought that unless I got on the other side of that wall I would be swallowed, and I got.

A. J. M.

"Hunting wild marsh-hogs is an exciting but somewhat dangerous pastime in southern Texas," said C. L. Fielden, of that State. "In the swampy lands along the Gulf these wild hogs have their habitat, and to hunt them it is best to have several companions and numerous dogs that understand the ways of the ferocious porkers. The dogs will find the game for you, bay it, and hold it in check until you can take a shot or two. Then everything depends on your aim. If you succeed in piercing a vital part with your Winchester bullet all is over except dragging the carcass to some convenient point where it can be handled.

"But dangerous is your position if your aim is a trifle defective and your shot only wounds the animal. Some good and true shooting must be done instanter then by you and your comrades, or else an infuriated boar will be rending you with his tusks. I have seen more than one of these old boars shot through the body twenty or more times, and in that condition fight man and dog until several balls had been fired into his head.

"In the marshes there is no possible way of escaping an attacking wild hog except by killing him. The hunter can make no headway through the tall, rank grass and boggy soil, and there are no trees that offer him refuge. For these reasons he is compelled to kill his game when once it is flushed, or become himself a victim. In the fall of the year these marsh-hogs are fat, and their flesh is of a very pleasing flavor."—Washington Post.

Sea and River Fishing.

In the Pound-Net.

BY FRED MATHER.

THERE are said to be as good fish in the sea as ever were caught, and it's only a question of bait. That saying originated when angling was the principal mode of taking fish, and before the invention of the all-devouring pound-net, with its long leader to turn fish into the "heart" and then into the "bowl," over which might well be inscribed: "Who enters here leaves hope behind." But that is the market pound-net which takes unwilling fish, this one only captures such as come to it voluntarily, and there is a great difference, still my net is getting a fair share of business and the character of the takes continues to be as varied as when it was first set.

Crappies in a Rapid Stream.

"Wheeling, W. Va., March 22.—Col. Fred Mather: After persistent solicitation by a number of anglers here, the United States Fish Commission was induced to send us a car of fish for distribution in Wheeling Creek. This stream has its source in Green County, Pa., and empties into the Ohio River at this point. It is a very crooked, narrow, rocky and fairly rapid stream, not very deep, excepting in one or two places, at least for ten or twelve miles from its mouth up, beyond that I am not familiar with it. We received word on November 3 that the fish car was due to arrive the next A. M., the 4th, and it did. The car was taken and sidetracked at a small station about five miles east of here right on the creek. It had aboard approximately 2,000 crappies, both large and small mouth, and 900 black bass, large mouth, all yearlings, with exception of about 75 of the bass, which run from one to three and one-half pounds. All the fish were lively and in good condition, and we transported them in tubs and cans by teams, distributing at various points along the stream within a distance of perhaps five or six miles from the station.

"It was reported here that a week or so ago some parties seining about the mouth of Fish Creek, which empties into the Ohio River about thirty miles below here, had caught some of our crappies. As the crappie is a new fish for us here, not being found in streams in this vicinity, and being unacquainted with its habits, it would appear that our crappies were getting away from us. It seems hardly possible to me that they would come down at this season of the year, although there are no dams in the creek between its mouth and where they were liberated. The creek, after the thaw following the severe storm and freeze of last month, was very high and exceedingly rapid, and it was reported that in a number of places it was frozen solid to the bottom. Could it be possible that in the thaw and wash out the crappies were forced down? I am not familiar with the crappie only to the extent of such information as you write in your articles in FOREST AND STREAM, Vol. L., No. 26, and Vol. L., No. 1; also what I find in Goode's American Fishes, and in both of the above I do not find much definite information as to winter quarters. I expect, however, to become better acquainted with them the coming season. You understand, that it is only by hearsay, that the statement is made of the capture below. Perhaps you may be able to give us something definite on the subject, or, perhaps, some of the readers of FOREST AND STREAM may be able to throw some light on the subject."

CRAPPIE. Never having known the crappie to inhabit swift streams in winter there is a doubt if they would stay there. The character of Wheeling Creek, as described by "Crappie," does not appear suited for this quiet fish. They love ponds and sluggish streams and are not at home in brawling mountain brooks. Such a "crooked, narrow, rocky and fairly rapid stream, not deep, excepting one or two places," is not the home that, in my opinion, the crappies would choose. Although the plant has gone down the river it is not lost. It will find a home in the Ohio River, or farther down in the Mississippi, where they are plentiful, therefore, any loss to the people of Wheeling is a gain in some other place. A dollar dropped in Broadway is not lost, except to the dropper, some other fellow picks it up and counts it as gain.

While Wheeling Creek may not be a good stream for the crappies it is certain that it will sustain some sort of fish. If the temperature in summer does not get above 75 degrees Fahrenheit, it would be an ideal stream for brook trout, but, having no knowledge of temperatures it is not possible to say that it would make a trout stream. For this purpose the temperatures should be taken in July and August at 2 P. M., when the water is warmest. Perhaps the crappies may come back, it was worth trying.

How Young Wood Ducks Leave the Nest.

In FOREST AND STREAM of March 18, 1899, I gave my observations on this subject, and, after quoting Dr. James Skillen, of the Harvard University Medical School, will comment on it.

"Col. Fred Mather, your article on 'domesticating Wild Fowl,' in FOREST AND STREAM of March 18 has cleared up one thing to me that I never have been able to find out before, that is, how the young of the beautiful wood duck leave the nest. I must say that I have derived more information from your articles in the FOREST AND STREAM in the last few years than I ever did before in the course of my whole existence, and I am getting pretty near the three-score limit.

"What a world of information there were in those articles, 'In the Louisiana Lowlands.' I assure you I appreciated those very much. I was pleased to see (last week, I think.) that you described the coot, as so many persist in calling all the so called sea ducks, coots. I believe in calling a spade a spade."

If Dr. Skillen takes my limited observations as being positive on this point he may fall into error. I said that the mother duck came from the nest and called her brood to come to her; they had sharp toe-nails, clambered out and tumbled down. But my mother-duck was a pinioned bird, who knew that she could not fly, therefore she was hampered as no wild bird is. If men have seen the

wood-duck bring her young from a hollow tree, either on her back or in her bill, I can not dispute them, but it requires a rare combination of circumstances to enable a man to see the act. He must be on the ground at day-break on the morning that she is due to hatch, or the morning after, and must arrive so noiselessly as not to betray his presence.

In the two instances observed by me the nest was within fifty feet of my back piazza, and I knew the day when the bird began to set and she was due to hatch 28 days later, with one day more to mother them on the nest. Wagons rattled along the road and there was many kinds of noise. I had only to crawl out carefully and watch; there was no chance about it. As I never saw a wild wood-duck get her young from the nest, I can't say how they do it, but I believe that the young climb out with their needle-like claws, as mine did.

More about the Berries.

Letters still come about the service berry, the "cedar berry" of boyhood, and others. Comrade Frank Robinson, of Philadelphia, sends some twigs of *Taxus canadensis*, or American yew, whose berries we boys of long ago used to eat and call "cedar berries," although they did not grow on cedar. Mr. Robinson says: "The specimens enclosed came from a bush growing along the Perkiomen Creek, about 25 miles above Philadelphia, which is evidence that it still exists. The twigs at this time, March 16, have some embryo and undeveloped buds on them, indicating where the berries will be later on. I will try and keep track of it and in the proper season will try to send you some with berries matured. Probably Dr. Hammond, or some other correspondent who writes of the service berry, will send it to you in the proper season."

The branches of this plant were like spruce in appearance, but not in taste nor odor; the buds were scattered along the under side of the stems in an irregular manner, sometimes single, by twos and occasionally on opposite sides of the stem.

What a Boy will Eat.

There is a sentence in the letter of Mr. Robinson that stops the wheels of time and sets the hands back half a century. He says: "I fear that Dr. Hammond, and others who were so enthusiastic over the service berry in their youth, will find that the tastes of boyhood have not survived. When we were boys we used to eat with great relish green apples sour enough to make a pig squeal, but could not be tempted to put a tooth into one to-day."

O, those happy days of long ago, when we boys tramped miles to pick and eat the tasteless "pinkster apples," irregular green juicy things from the size of peas to that of a hen's egg, probably galls, which grew on a shrub which we called "wild honeysuckle," probably *Asalea nudiflora*, as the flowers came before the leaves. The name "pinkster" being Dutch and an equivalent of Whitsunday, the seventh Sunday after Easter. The Dutch about Albany called the flower "pinkster blooms."

In summer we hunted the woods for "wild lemons" or "May apples." These grew on an annual plant in dense woods: the plant being about 1 ft. high, with two great leaves, and bearing a yellow fruit at their junction, which, when ripe, was an inch long and less than that in diameter. Perhaps this is the mandrake, *Podophyllum*, but I am very weak on botany. Our names were appropriate; "wild lemon," because it was a cloying, sickish sweet, and filled with seeds, like a tomato, and "May apple," because it ripened in July. Yet the trailing arbutus is called "May pink" on Long Island, where it comes and goes before May; yet this was the "Mayflower" of the English, from which the famous vessel was named.

Then we would climb oak trees for the green or newly formed galls, which would give the least bit of a sweet juice. Other things beside green apples which we searched for to eat, but which would not tempt us to-day, were the little puckery wild grape of northern New York, choke-cherries and elder berries. Of course, we ate both kinds of sorrel, and, by the way, these are good stewed, like rhubarb, and we dug bumble-bee honey out of the ground in large, felt-like sacks, and took an occasional sting to emphasize our enjoyment.

In those days an immoderate indulgence in green apples might cause some intestinal cramps and pains between the abdominal cavity, reaching down to the transverse colon, which the doctor would term colic, but was known to us by the simpler term of "belly-ache," and then the anxiety of the good mother, who watched the boy in his agony all night and dosed him regularly and kept hot applications on his bowels. O, I tell you: a boy brought up in the city never knows what real fun is.

Comrade Robinson must have been a boy once. I say this because I've seen thousands of men who never by any possibility could have been boys. They were born "young men" and broken to live by rule. If mother said: "Johnny, you must not eat that apple, it is not ripe," or, "Willie, if you climb trees you will tear your clothes and look like a beggar boy," or, "Now, Reginald, if you go off the road you'll get into the swamp and ruin your shoes," they would obey orders. I pity such boys; they get a wrong start in life by being taught that they must be ever on the watch for their stomachs, and also must be at all times fit for presentation in the drawing-room. That kind of training will kill the spirit of a full-blooded, enthusiastic boy.

A Word about Mothers.

In most cases a mother exercises more influence in the training of a boy than any other person, for she has, or should have, him completely under her control for the first ten years, and can mould his character, if she will. Most of our professional criminals come from mothers who have lied to them in order to smooth over some question; the child soon learns that his mother is a liar, and then he believes no one; and from lying comes other crimes. Some sixty years ago a boy was tempted to cut into a hot cake, and then lied about it to his mother. There was circumstantial evidence against him, and a thin-soled maternal slipper was prescribed as an outward application to prevent internal complications from a too generous diet. After the counter-irritant had

produced the desired flow of blood to the skin, it was explained to the boy that what he had received was merely due him for a violation of orders concerning the drawing of extra rations without the formality of first applying to the chief commissary in regular form and having the requisition honored. But that was the least part of the punishment. "Now," said this model mother, "because you told me a lie you are not to have pie, pudding nor cake for two weeks." That was the worst part of it; but it was enforced, and that boy once played hookey from school for three days and came home with water-soaked shoes and torn clothing, bearing a peace offering of a string of small pan-fish, and owned up squarely to his mother, received a lecture on playing hookey, and the father never heard of it. She realized the fact that the spirit of a vigorous, ambitious boy should not be broken on the treadmill of propriety.

This mother realized that her boy had a taste for fishing and for the woods, and on Saturdays and holidays, as he grew older, enjoined him not to throw away the small fishes, because she liked them best, and when between the fishing and shooting seasons she encouraged him to pick berries and gather nuts, even if he did soil his shoes and clothing, and he grew up healthy and strong. This is a true story, for I knew both mother and son in the long ago, and the boy never lied to her afterward. He grew up to be fond of athletic and field sports, served his country as a soldier, and I believe he is alive to-day. Some mothers might have made a "Miss Nancy" out of that boy; one who wouldn't soil his shoes by getting too near a creek to fish, or too far off the road in a swamp for woodcock, but—perhaps she couldn't in the case of this boy if she had tried. Much can be done in training, but the bent of a boy's mind has been fixed before his birth, and the best that a mother can do is to discover that bent and encourage it, with the inculcation of truthfulness and honesty as indispensable starters on the way of life. If the boy has no taste for mathematics, music nor theology, it is a wrong to force him to study these things. I have known men who have failed by being forced from their natural tastes.

Please don't interpret these remarks to mean that when a man has failed to bring out the best that is in him that he is a failure in a financial sense. The commercial instinct leads a few men on to fortune and thousands to suicide. My idea of a successful man is one who makes a comfortable living in an honest way and is content; he has no aspirations to be a billionaire, because he knows that when he dies he cannot take his gold with him.

First of all, a boy, or a girl for that matter, should be a healthy animal, and only outdoor exercise can make him so. He may not care for field sports, but he will be sure to like boyish sports of some kind, and most boys aspire to be athletes, even if they never get beyond the aspiration. They admire the soldier, the sailor, the acrobat, the rough rider and the wrestler, and even the prize-fighter. Courage displayed in any manner appeals to him, and a wise parent will try to direct this sort of hero-worship in a proper channel away from that pernicious literature so plentifully provided for boys, which pictures bandits and desperadoes as heroes. The boy does not discriminate between the soldier and the criminal, because he is absorbed in contemplating bravery, no matter in what cause. And there you are!

More Berries.

Besides the wild berries which have been written up by various correspondents, who rushed to rescue me from ignorance concerning berries I have lunched on, there are questions about some other berries of the woods. Mr. Mark E. Noble writes that the mountain ash is sometimes called "service berry"; this is new in these discussions, and I did not know that the showy berries of this tree were eaten, even by birds; yet, as it is not an ash, but one of the rose family, its fruit might be edible by birds. Neither is the prickly-ash a true ash.

This drifted into the net: "Are poke-berries and the seeds of the poison ivy poisonous?"

It has been recorded that I have no claim to botanical knowledge; the net is set mainly for fish, but of course weeds will drift in. The question raises another, as to what a poison may be. In my unprofessional way it seems that the question resolves itself into a question of quantity. Opium and alcohol are poisons if enough be taken, and men become so used to them as to be nearly immune. Taking up the beautiful pokeberry, which is well worth a place among decorative plants, but is neglected because it is wild and common, we boys tasted them, but a taste sufficed, for the luscious-looking grape-like fruit was not palatable; yet our robins eat them so freely that it colors their flesh in the fall, and when I owned a mocking bird I gathered quantities of pokeberries and dried them for a winter treat, yet the berries are poisonous to man if taken in sufficient quantity. This is the *Phytolacca* of the materia medica, also known as "garget root." In the spring the young shoots are cooked like asparagus, and eaten in parts of Massachusetts and New York, and are sometimes known as "skoke."

The effect of eating seeds of poison ivy are unknown to me, except in the case of the crow and the bluejay; both birds eat them and pass the seeds without injuring their power of germination, and they have so lined the roads of the north side of Long Island with this plant that there is a mat of it between the traveled part of the road and the fence, and it climbs every fence and tree on the way. Its bright autumn colors on every tree trunk are the only good thing about this pest. He would be a bold man who would eat the seeds, and there is nothing on them to tempt a man. This is the "Rhus" of the medicos, and it may be that it is only an irritant to the skin. Ich wise nicht. I only know that this vine may be distinguished from its harmless relative, the "Virginia creeper," by having a triple leaf, while the equally beautiful, but harmless one has "five fingers."

These things show that what may poison a man will not necessarily poison a bird; why not; since the adage runs, "What's one man's meat is another man's poison." No saying is truer; some men cannot digest cabbage, radishes, cucumbers and other vegetation, although most men find meats easy of digestion, and therefore it is not strange that birds, whose blood is many degrees warmer

than ours, may digest and assimilate foods which would poison us.

Birds as Seed Distributors.

The statement that birds ate fruit and berries and dropped the seeds undigested and unharmed was a familiar one, and I often wondered how students of nature were sure of this fact. I found it out in this way. In front of my Long Island home there was an old lead pipe leading from a spring above which had supplied the kitchen of a house that had been burned years before. I made a cement basin there of some 10 by 20 ft., and in one end built a cemented rock-pile of the roughest stones at hand, with the old pipe as a center. There was a basin in the top, some 6 ft. above the level of the water, and from this small trickles dropped over the stones here and there in imitation of nature. In a few years the stones mossed over, and somehow several water plants established themselves in the basin in such numbers that they had to be kept down. In keeping a rank growth of water plants down we found vegetation which was not aquatic.

Just above the water line, and where no wind could have blown the heavy seeds of the raspberry, the wild black cherry and the choke cherry, these plants were found growing in the damp moss above the water line; not one or two, but dozens of them.

The little basin on top, some 2 ft. across and sloping to 6 in. deep, was my private property, but somehow the robins, wood thrushes, blackbirds and other neighbors came there, drank, bathed and never asked my permission. Of course it was a case of trespass, but they were such lovable neighbors, so filled with song and genial companionship, that I never begrudged them a few mouthfuls of water nor a bath, and did not even put up a sign warning them of the penalties of trespass; yet every spring that dripping fountain had to be weeded, and the berries and cherries which had sprouted could not have blown there, and I had a belief that the robins were in some way responsible for the seeds being carried up there, and I believe it to-day.

Nothing is more evident than the provision of nature for the life of every plant and animal; the plants especially need the agency of bird, beast, air and man to carry their seeds to fertile grounds and they get there. The railroads have scattered many weeds along their tracks; but this is a thing that demands a volume and is not to be compressed in a few pages of *FOREST AND STREAM*.

An Absurd New York Law.

I read in "Game Laws in Brief," under the head of fish, the following: "No trout of any kind, salmon-trout or land-locked salmon, shall be taken from any of the waters of this State for the purpose of stocking a private pond or stream."

Now, I am not a lawyer, but I'd wager a bottle of good spring water that this clause is not worth "an embankment across a stream." For instance: Mr. Jones is fishing in a legal manner and in the proper season and takes fifty trout which he may kill and eat, or leave to rot on the bank, as men have done. The fish are his after being legally reduced to possession, and the law says he may not keep them alive, transport them to his ponds to be kept for breeding purposes. He may kill the fish, but must not take them alive to his ponds!

Would a judge or a jury bring that man in guilty of a crime? Not on your wife's Easter bonnet. If a test case comes up on this section the question of the constitutionality will bob up at the same time, and if Mr. Jones was convicted of an offense it would be an outrage on the right of a man to use his game as seemed best to him. If Jones has reduced a wild duck to possession by legal means and the bird is only wing-tipped, would any man, or court, deny him the right to either kill that bird for food or to try to domesticate it, as seemed best to him? And there the case rests.

New England Angling.

Boston, April 10.—The fishermen who went after trout last week in this part of the country have generally made but very poor catches. Cold weather and ice and snow water in the streams are not favorable conditions for trout fishing. A few small catches were made at Bourne, Falmouth and elsewhere on the Cape and South Shore, so far as reported. Along the North Shore almost nothing has been done, the brooks being still high and full of ice water. In the northern and western portions of the State there is yet a good deal of snow on the hills and trout fishing is very late. A gentleman who is fixing over some buildings in Weston on a farm he has bought for a summer residence, says that there is a pretty good trout brook on his land, which he proposes to restock and protect. He drove down from the railway station the other day and happened to see a boy fishing his stream a short distance from the road. The carriage was stopped and the driver shouted to the boy to "Come out of that!" The boy dropped his improvised rod and line in some alarm. He was told to come up to the road, which he did. There he was made to show his catch—two fairly good trout. He protested that he did not know that anybody objected to the stream being fished, and was willing to surrender his trout, but asked for the privilege of returning to the stream to get his line and jackknife. This he was allowed to do, and when he came back, still shaking with fear, the gentleman returned him his trout, with the injunction not to fish the stream any more. This he promised to obey, and in his gratitude at getting off so easily promised to "keep the other fellows away."

In Maine the fishermen are still pickering through the ice, with considerable catches reported. The ice is very thick on the lakes and ponds. A well-known guide was here Friday from the Rangeley region, and he suggests that the ice cannot possibly get out of the lakes earlier than May 20. This would not be the latest clearing on record, for in 1888 the ice did not get out till May 21. Again, in 1893, the ice staid in till May 23. Last year Mooselucmaguntic cleared May 4, and Richardson Lake the day before. Rangeley was not clear till two days after. The earliest clearing I have any record of was April 30, 1889, and the latest, as noted above.

In New Hampshire the brooks are either closed or overflowed with snow water, the woods yet being full of snow; in some sections very deep. A gentleman, in from Nashua on Saturday, says that there are some pretty good trout brooks in that section, but nothing has yet been done. Newfound Lake, noted for its land-locked salmon fishing last year, is yet locked in very thick ice. It cleared of ice last year April 17, but must be much later this year.

Salmon at Bangor, Me., are very late. Last reports say that the Penobscot is still full of ice, either solid or floating, and that the salmon netters at Bucksport and below have not yet been able to put in their nets.

SPECIAL.

Fishing Up and Down the Potomac.

Analoatan River.

ANALOSTAN ISLAND is a part of the District of Columbia opposite Georgetown, and just below the Virginia end of the Aqueduct Bridge. During the Civil War, and for long after, it was a pleasure ground; in later years was occupied by a local athletic club, and during last summer was the scene of sundry mysterious operations that for awhile puzzled the neighbors, but which turned out to be official tests and experiments with modern explosives, presumably in connection with the preparation of mines and torpedoes for the Potomac.

Analoatan River, sometimes called Little River, and sometimes Lost River, is the narrow chute between the island and the Virginia shore. A causeway of rip-rap from the head of the island once joined it to the mainland, and near the lower end was a trestle bridge many years ago, the decaying piles of which still lift their black heads far above the surface at ordinary stages.

The rip-rap has been broken away next the island, and the tide pours in and out over the stones, so that the river is really little more than a pool. At low water it rushes out with so strong a current and so shallow, that a skiff must be lifted over the causeway; but at high tide the rocks in the break are hidden and a boat drawing considerable water may pass through.

Opposite the lower end of the island, on the Washington shore, once stood the ancient city of Hamburg, a boom town in the early days; it looks pretentious enough on the first maps, but was lost in the shuffle when the seat of government was located all round it.

Here, too, is "Braddock's Rock," so long venerated as the "Key of all Keys," the wharf where Braddock was supposed to have made a sensational landing of his forces, before that day when he annexed our own George.

Working the old stone wharf as a quarry to lay the foundation of Washington's present greatness, run over and dug out by the Chesapeake and Ohio Canal, which was located along the shore at this point; reclaiming the river flats and locating the channel so far out to the west as to leave Braddock's Rock far inland; using the nearby territory for a dumping ground, and an unsightly sewer arch that passes now close by, on its way to the river, has left nothing in sight but a big stone with an iron ring, that may have as well served to support a quarry derrick as the cable of a transport. And as if it were not enough that the poetry should have died amid its loathsome surroundings, come now the modern historians and prove beyond any reasonable question that it was impossible that Braddock should have ever landed here, either in person or by the proxy of his commissary; that it was out of the known line of his march from Alexandria to Frederick.

Thus one by one perish the traditions of youth. Maybe Braddock was a myth. Returning to the pool, for Lost River is little else, we find it quite deep just inside the causeway. It was 33 ft. when the Coast Survey charted it in 1862, but probably much less now, shelving up to 6 or 7 ft. near the old piles, and beyond these principally marsh, with a narrow passage to the river at high water.

The bass are caught for the most part about the piles, though sometimes they are found along the edges on either side for its entire length, and still more rarely a catch is made at the causeway at a certain stage of the tide which we have never found.

Only a few chosen ones have been fortunate enough to secure great catches in this pool, and it is well it is so, for if the bass were always as responsive as they sometimes seem to be here, they would soon be extinct in this particular locality.

We have made three or four efforts here and caught a few bass and crappie, but our visits seem always to be ill-timed. It has been at the sunset hour, the only holiday we cared to spare for so small a pool, and we have ever been too early or too late; the tide was wrong or the was not quite right.

Reaching Georgetown after an early dinner, we have taken a gunning skiff at a local boat house, a low white cedar affair with two double paddles; ten minutes gets us across the river and into the pool, and the man in the bows lays down his paddle and whips till he catches a fish or despairs, and then we change places and occupations. We have always found other unfortunates on hand who fared no better than we, and a single bass, taken with a spoon, is the only fish we ever saw our rivals pick up, and that did not weigh above 1½ lbs.

We saw on one other occasion a spoon lose a three pounder after a few minutes of lively struggling. The only other fish we have ever seen here we rose ourselves, and their name is not legion.

But for all our bad luck, large strings are caught here, both with fly and spoon, and twice to our knowledge by strangers, at least as much as we were, who either had the help of local boatmen who knew when, or were lucky enough to strike it right, or maybe (this admission is too humiliating), were more skillful.

A season or two ago a friend had a strange adventure in this pool. He had gone with a companion for some reedbird shooting, which is sometimes very good when numerous gunners on the larger marshes have frightened the birds to take refuge in the little patches of wild oats that grow on the margins. They were out in gunning skiffs and noticed a large bird carrying something in his claws flying backward and forward across the pool, and took it for granted that it was a hawk with a fish. Counting all fishers except with a hook as pirates and

thieves, he called to his companion, some distance away, to "drop that bird." The bird fell at the shot not far from the skiff, and putting out his punting pole the wounded bird clutched it and was proudly lifted into the boat, where it perched on the bow seat for a few moments. It proved to be a monkey-faced owl, and presently began hopping down toward the captain with such a truculent bearing, such a general bloodthirsty threat in its eye, that the man wished himself at home, or anywhere away from this man-eater. A gunning skiff is not a good place for a fair stand-up fight with anything larger than a hornet, and the hunter began to grow excited. "He's coming at me; come here, Charlie," and he made a vicious kick at the still advancing bird, but it fastened its talons in his left leg just above the knee. Thoroughly frightened now, and hurt as well, he struck at it with his fist, and the owl caught his right arm above the wrist and had him beautifully pinioned.

He yelled lustily for help, for he could not move in the cranky skiff, and the claws, which were in the meat for fair, hurt like thunder, as he put it afterwards.

When Charlie got there he found the owl ready to tackle another victim if he only had the tools, and so firm was his hold that it was necessary to cut off its head and both legs before his friend could be released.

It is experiences such as we have had at this pool that lead us at times to temporarily agree with those benighted individuals who can see nothing in fish or fishing. Occasional failure has no terrors for the earnest angler; but continued ill-luck would daunt the most enthusiastic. Those who have most bitterly opposed fishing as an amusement are those who have been unable to master the rudiments of the science. The simply indifferent and contemptuous are those who have some other hobby which they ride as persistently, but which leads them to despise all other mounts.

This recalls an oft-told story, sometimes credited to Evarts, whose keen wit was the father of many a good joke and the putative father of many more. It is said that once visiting the easy ward of an insane asylum, it had been suggested to him to humor such of the patients as might exhibit a social front. Passing one seated on a table posing as a Jehu, Evarts remarked, "You are enjoying your hobby?" "This isn't a hobby, it's a horse," retorted the defective. "What is the difference?" said the great lawyer. "Why, you eternal idiot," said the patient, "you can get down off a horse, but who ever saw anybody get off a hobby?"

But as a rule, the hobbyist, no matter how different his pursuit, has a certain sympathy for the weakness of his fellow similarly afflicted, and his meanest speech is usually that while angling isn't in his line, the pleasure so many good men get out of it is proof enough there must be something in it.

But the angler that failed goes further than this, and sees no good in fish, no fun in fishing, nor sense in the fisher. Such a one, Herbert, who wrote in 1834 in the *American Monthly* (p. 92): "There is something unhappy in the physiognomy of a fish: in the downward curl of the mouth upon each side, that seems to betoken at least an infirmity of temper if not a settled misanthropy. * * * Fish, to my taste, is a poor, wishy-washy, unsatisfactory aliment; there is no getting fat on it. * * * No superiority of intellect is required in their destruction. The veriest blockhead that ever put meat into his mouth shall catch you as many fish as a Scott or a Napoleon; ten chances to one indeed more. A bare-footed, smutty-faced dolt-headed boy, to whose thorough-going stupidity there is an inconceivable mystery in the A, B, C; one of those double-distilled miasms who seem to be gifted with a forty dunce-power of resistance to all efforts at education; upon whom argument and appeals, a priori and a posteriori, are equally thrown away; one of these with nothing more than a paltry bent pin, a few wretched earth-worms and 3 yds of brown thread, shall beguile from their native element scores of the best informed and sensible fishes that swim." And then he goes on to deny them sense, decency and feeling.

Nothing could have prompted such a tirade save defeat. The poor abused fish, which he tried to beguile, refused to come and were at least smart enough to decline his advances. Here is, no doubt, the origin of that story of the man with fancy tackle having his eye wiped with a bent pin, which we have so long denied. This is the man, and he could not forgive the boy, the fish, or his successful rivals.

HENRY TALBOTT.

To Cook a Snapping Turtle.

DODGE CITY, Kan., April 4.—*Editor Forest and Stream:* To dress and cook a snapping turtle, first cut his head off. Scald him in a wash boiler of very hot water and scrape legs, tail and all exposed skin with a blunt knife. Turn him on his back and saw the shells apart on the sides. Take off the under shell; skin it off; don't tear it off; this exposes the intestines. Take out everything but the meat, taking care not to break or cut the gall. Cut out all the meat, leaving the ribs on the meat. Soak the meat in strong salt and water at least three hours, twelve is better; then rinse in fresh water thoroughly. Stew the meat in a dinner pot till tender. Take out the meat and fry it like beefsteak; season to taste. You can thicken the soup and put in a leg or tail or two cut fine; few persons care for the soup, however. Cut out the meat with a strong, sharp knife. If the turtle is big, don't use the skin. It's tough and strong.

W. J. DIXON.

Charleston Lake Bass and Salmon.

CHARLESTON LAKE, Ontario, Canada, April 7.—*Editor Forest and Stream:* This spring promises to be a pretty late one. Last season the ice left the lake March 27, but the guides and those living near the lake think that it will be the last of April before the ice moves out this year. At present the ice is from 18 to 24 in. thick and perfectly solid. Teams are crossing every day. As soon as the lake is clear salmon fishing begins, and is usually best from the 1st to the 20th of May. The average catch to a boat per day is from ten to eighteen, and in spring they run large. Already several New York Brooklyn, Philadelphia, Boston, Trenton and Newark, N. J., parties have engaged guides for the opening.

W. H. LEAVITT.

The Percy Summer Club.

THE Percy Summer Club, which owns a tract of land and a lake twenty miles north of the White Mountains, in New Hampshire, has had an interesting legal experience with the authorities of the Granite State in an endeavor to preserve its fishing for the exclusive benefit of club members. The case was finally carried before the United States Supreme Court, and after nearly ten years of litigation a settlement satisfactory to the club appears to be in sight. The case, which early in its history resolved itself into a duel between the club and the State of New Hampshire, has established important precedents, and is reviewed here on account of its interest to sportsmen in general, whether they believe in private or public control of the larger fishing waters.

The Percy Summer Club was incorporated under the laws of New Hampshire in 1882 for the purpose of acquiring a private preserve to which its members might resort for rest and recreation. It has a limited membership, including at the present time Messrs. George P. Rowell, head of the George P. Rowell Advertising Agency; Francis H. Leggett, the wholesale grocer; James D. Platt, who is connected with the Standard Oil Company; S. H. Kauffmann, president of the Washington Evening Star Newspaper Company, and Rudolph Kauffmann, one of the editors of the Star and a son of Mr. S. H. Kauffman. Mr. Rowell has given *FOREST AND STREAM*, in an interview, the following particulars:

The club acquired by purchase a lake of 350 acres in extent and about the same amount of land at Percy, in the town of Stark, Coos county, N. H. The lake was renamed Christine Lake. It already had a number of local names, of which North Pond was perhaps the most commonly applied. On maps it is put down as Potter's Pond, though just why this is done no one can say, for the name is never used locally. When the club made its purchase it was careful to secure title not only to the lots immediately adjoining Christine Lake, but also strips of land on both sides of a stream running into the lake reaching to and including its source, and also land bordering the outlet to the point of its juncture with the Upper Amonoosuc River.

At the time of the purchase the laws of New Hampshire provided that any pond or body of water reserved for the propagation or preservation of fish might be preserved for private use by posting with the proper notices, and a heavy fine for trespass was attached. It was under this law that the corporation was originally established. There was at that time no recognized acknowledgment fixing a limit to the size of lakes which might thus be preserved for private use. Later, however, the Legislature passed a law declaring all lakes of more than twenty acres in extent public waters and excluding them from the privileges of the previous section.

When seen at his office Mr. Rowell said: "It has been claimed of late years that in colonial times New Hampshire was a part of Massachusetts, just as Maine was. It is a law in Massachusetts, and that law prevails in Maine, that all lakes of more than ten acres in extent are public waters. This part of New Hampshire where our preserve is situated was never included in the section of New Hampshire which was once a part of Massachusetts, and we claim, therefore, that if the Massachusetts law ever did prevail in New Hampshire, which we don't admit, that it never had application to that part of the State where our property is located.

"We claim further that we hold title from the King of England, and we trace our title before the State had existence; and that our title conveys to us not only the land, but also the water and the land under the water. This claim we have set up in the highest court of the land.

"When the Legislature passed the law declaring lakes or ponds of more than twenty acres in extent public waters, we maintained that the law could not apply to us, because we owned the lake before the State had anything to do with it. The Legislature thereupon passed a law to the effect that any person arrested for trespass in crossing wild lands to visit public waters could not be held answerable for costs unless the damages amounted to more than \$13.33. That was equivalent to throwing the costs of prosecution on us and deprived us of redress against persons fishing in our lake. Having attempted to protect our rights in the New Hampshire courts up to the highest court, and having received adverse decisions, we transferred our property to a corporation formed under the laws of New Jersey, and proceeded against the trespassers in the United States Courts. The litigation which followed extended over several years, and cost more than the property did originally.

"Finally there was an attempt made in the Legislature of New Hampshire to have the State assume the cost of the litigation, that had heretofore fallen on the trespassers, and that action led to a compromise by which the State gave the members of the Percy Summer Club, of New Jersey, the right to form a new corporation under the laws of New Hampshire, and to buy or lease interests belonging to the Percy Summer Club, of New Jersey. The club agreed to admit the right of the public to fish in the lake under restrictions which should also apply to our own membership, and received from the State a charter which made trespass on the lands of the club other than passage over a prescribed path punishable by a fine of \$25 for the first offense and \$50 for the second. The public obtained no right to leave boats on the lake or to camp on its shores. They were obliged to bring their boats with them and carry them away when they left.

"Shortly after the club got under way under its new charter (having leased the property from the New Jersey corporation, with whom it must be noted the title still remained), the United States Courts decided that the Percy Summer Club of New Jersey did own the lake and had the right to control fishing in it. The members did not immediately avail themselves of this decision. The New Hampshire law protected their land so thoroughly from trespassers that they were disinclined to surrender their charter. They have lived under it three years. The open fishing, however, has attracted so many visitors in the early part of the season, and they have succeeded in depleting the lake to such a degree that there is now no fishing for anybody. At the last meet-

ing of the managers it was practically decided to surrender the New Hampshire charter and resume the rights accorded by the United States Court decision."

The people in the town of Stark are friendly to the interests of the club. The trouble from trespassers comes from persons residing in two manufacturing towns, Groveton, eight miles north of the preserve, and Berlin, twelve miles south. To shut out this element as far as possible, fishing was restricted to the hours of 10 A. M. to 12 M. and 2 P. M. to 7 P. M. daily, and the season was made to begin a month later than that prescribed in the State game laws and to end fifteen days earlier.

Christine Lake is a pristine trout lake. There are no other fish in the lake with the exception of minnows too small to take the hook, they are the black-nose dace scarcely 2 in. in length.

The trout are noted for their beautiful coloring and handsome shape. They are exceedingly gamy and of a uniform size, and so marked is this fact that it is notorious that the average weight of a catch never varies much from ¼ lb. During the seventeen seasons the club has been in existence only three fish have been taken which weighed as much as 1 lb. The members all fish with the fly and with the very lightest tackle, and formerly, when the lake was protected, the catch was restricted to a limit of forty, a number often taken in an hour's fishing in the evening.

The club property borders on a tract of wild mountainous land corresponding in some respects to the Adirondacks. It is approached from Percy Station, on the Grand Trunk Railway, and though Lake Christine is only eighty rods from the station, it lies on an elevation 238 ft. higher, and for all intents and purposes is as remote from civilization as virgin trout lakes much more difficult of access, no sign of human habitation other than camps belonging to members of the club is to be seen from any part of the lake, which is an ideally beautiful body of water, surrounded by hardwood ridges.

The club has been very successful so far as its internal relations are concerned. Each member has his own cottage, which he regulates after his own ideas, and the greatest individual freedom is allowed. There are, of course, general rules which must be observed. The houses are painted uniform harmonious colors, and are built in accordance with the designs of a recognized architect. There is a superintendent, who looks after the fishing regulations, and is prepared to receive club members on their arrival.

The situation built upon is about a mile and a half from the public landing.

How they Take Whitefish in Idaho.

ST. ANTHONY, Idaho, March 19.—*Editor Forest and Stream:* Yesterday afternoon at about 3:30 the man who lives just across the street came by carrying two great strings of fish. We were in the backyard, and as he passed he called out, "Want some fish?" "Why, yes." "Well, here's a hook and a pole. Just below the head-gate there are millions of them."

We lost no time hurrying into our overshoes and jackets, and got the pole, which proved to be the middle part of an old cane fish pole, with about 4 ft. of strong fish line tied to the end, and fastened to this a grab-hook. The head-gate is the waste-gate, where the surplus water from the big canal is turned back again into the Snake River. The water falling over the planks placed in the gate has washed out the sand, leaving a deep hole, with great lava rocks standing, and through these the water rushes in white foam. At the foot of these rapids we stopped. Fred dropped the hook into the water, gave a sudden jerk, and brought out a fish that might weigh ½ lb. He looked at me sort of astonished and said: "Well." The next few casts were unsuccessful, but he caught another, and then gave me the pole and walked down stream. About 20 ft. down he called me, and there, where the water was more quiet, we could see them thick as the pebbles on the bottom. We took turns using the pole, and when we had ten Fred went home, while I fished on. A boy of about ten years came down and watched me and took the fish off my hook when I threw them out. I was fifteen minutes catching ten more.

Just above me a little girl was fishing with an ordinary tying twine doubled and tied to a willow stick. Her hook was badly tangled in an overhanging willow and all her efforts failed to loosen it; the boy proffered his services, untangled the hook and proceeded to use it. After he had made fourteen casts, landing twelve fish, one strand of twine broke; but he fished away and I left them with twenty-seven fish lying on the snow.

From our window we look out upon the canal 75 ft. away, and to-day being Sunday have seen half the town population fishing there. So thick was the crowd sometimes that hooks and lines were tangled together; but none the less all were having fun. I am positive that more than 1,000 fish have been taken from that hole since we fished there yesterday, and yet their moving tails and fins make the water appear black.

The fish are called here river whitefish. The law does not protect them, as it is known that they subsist principally on trout spawn during the trout spawning season and are therefore more of a detriment than otherwise.

I am told that this same thing occurs every year. The fish in their journey up-stream, which they make as soon as the warm weather begins, are stopped by the swift water and falls of the head-gate, and are caught by the thousands by means of the grab-hook. They very seldom take a fly, but we have caught them in the south fork of Snake River—Jackson's Hole—with bait. They are very good eating; almost equal to trout.

MRS. F. E. WHITE.

Ohio River Trot-Line Fishing

CENTRAL CITY, W. Va.—Perhaps if I had been a knight of the rod and reel—a real scientific angler—I might not see so much sport in this style of fishing which is practiced to a considerable extent in the Ohio River. Describing the method, a good-sized line, say of 100 ft. to 100 yds. in length—which the fisherman calls the "stagging"—is used, on which are tied short lines at a distance of 2 or 3 ft. apart. On these are the hooks, generally

small, which are baited usually with crawfish, which abound in the brooks and are caught with a dragnet. Several stones are tied to the staging in order to sink it to the bottom of the river, leaving the baited lines free to move and attract the fish.

As the tide of the Ohio is about three times as strong as that of the Hudson, the fisher generally has an assistant to keep the boat in place and at right angles with the line while he makes a haul, takes off the fish, rebaits and drops the line as he proceeds. Several times I have been out acting as an assistant for my son at sunrise, just as the fog was lifting, the sunlight streaming through the mist and reflected from the water as from a river of polished glass. The scene was enchanting, and thus enhanced the glory of the sport.

The hooks being small, a gaff-hook is used to secure the fish (if he is large), after he has been carefully brought near the boat, or rather the boat pulled to the fish. To take in half a dozen or so of different kinds of fish, some weighing 6 or 8 lbs., on such a morning as I have described, is an experience not soon to be erased from the memory.

N. D. ELTING.

Small Chinook Salmon.

FISH COMMISSIONER MCGUIRE writes in the *Portland Oregonian*: There has been a great deal said and written during the past twelve or fifteen years on the subject of the destruction of small chinook salmon, weighing from ½ to 8 lbs., too small to be of commercial value. These small fish are taken by the traps, wheels and seines, the smallest gill-net mesh used on the Columbia River being large enough to allow them to escape. The contention of gill-net fishermen and many others for years has been that the destruction of these small fish would ultimately exterminate the chinook. In this contention they were sustained by the statement of David Starr Jordan, president of Stanford University, an acknowledged authority on the salmon and trout of the Pacific Coast, who, some years ago, after investigation of the subject, wrote:

"The utter disappearance of the salmon fishing on the Columbia River is only a question of a few years unless some vigorous means are taken to prevent the destruction of small fish."

According to the statement of canners and other persons connected with the salmon fishery, these small chinook salmon are all males, which, though undeveloped as to size, are sexually mature. They base their opinion on the generally accepted theory that only fish capable of undergoing the reproductive act enter the river; that male fish of this small size are known to have had ripe milt and to have undergone the spawning process, and that no female salmon weighing less than 7 lbs. has ever been taken in the river. I have been disinclined and slow to accept this theory of cannerymen and others, believing that it was possibly inspired by selfish interests, and because it seemed to me contrary to nature that these small fish should all be males, and I determined to investigate the subject whenever opportunity should offer. This I have done during the past two years. I have opened and examined about 150 of these small salmon, weighing from 2 to 8 lbs., and every one of them proved to be males. I have also watched these dwarfed fish on the spawning beds, and can confirm the statement made by W. F. Hubbard, superintendent of the United States hatchery on the Clackamas, that after spawning they die, as do the larger fish. After making these investigations, I wrote to President Jordan, calling his attention to his statement on this subject, quoted above. His reply is appended:

"It now seems probable that the small chinook salmon running in the river are all young males. They are all sexually mature, and the greater part of them die on the spawning beds. As no females are found among these young fish, it would seem that their destruction can do no harm. As it is, the adult males are sufficiently numerous to serve the needs of the species."

The testimony of Dr. Gilbert, of Stanford University, and Waldo F. Hubbard, superintendent of the United States piscicultural work in Oregon, is similar to the above. Although the case is not susceptible of absolute proof, yet the evidence seems to favor the view which I have heretofore contended was contrary to all that common observation teaches in regard to animal life. However, this is not more wonderful than the fact that practically all chinook die after spawning, while the steelhead returns to the ocean after performing this function.

The passengers on the ferryboat Piedmont, on the 9:30 o'clock trip from Oakland on a recent morning were treated to the spectacle of a speed test between a sea eagle and a carrier pigeon, in which the smaller bird won by saving its life. When the boat was opposite Goat Island, P. H. Schlottzauer, a pigeon fancier of Alameda, released five birds. Among them was the famous five-year-old homer Duke of Richmond.

The pigeons rose into the air and circled several times. Four of them turned toward the east, but the fifth, which was the Duke of Richmond, was seen to flirt and drop toward Piedmont. Then the passengers made out that the pigeon was being pursued by a large bird.

The two birds were at an elevation of 1,000 ft. when the chase began, with the carrier a short distance in the lead. As if by instinct he dropped straight for the place where his master had released him, and, landing upon the ladies' deck of the Piedmont, fluttered through the cabin door. The sea eagle was so confident that it would strike its prey that it did not check its pursuit until within 10 ft. of the rail of the ferryboat. Then it wheeled suddenly, and, hovering about the stern of the boat for a few moments winged its way back toward Goat Island.

Once inside the cabin, the frightened pigeon ran down the aisle until it came to a passenger reading a newspaper. As if sure of protection, it fluttered up to his side and perched on the arm of his seat.—*San Francisco Chronicle*.

The *FOREST AND STREAM* is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Some More Reasoning Dogs.

SPORT is a full-blooded layerack, and a great favorite in the Western town in which he lives. He is in great demand during the hunting season, and accompanies men and boys with equal zeal.

One day a company of small boys organized a hunting party. Three of the boys waited in the alley with one gun and a shepherd dog, while the other boys, with the other gun, went up to Sport where he lay in the office door of his master. They showed him the gun and invited him to accompany them. Sport was delighted, and went with them to the alley; but when the other boys joined them with the shepherd, Sport gave that dog a look which, in his language, meant: "You may be a very good dog, no doubt you are; but you can't hunt."

Then he walked back to his place in the door and lay down. To all the coaxing of the boys he just wagged that expressive tail of his, as if to say: "O, go on, you boys; that dog may be a very fine fellow, but he has not been trained to hunt, and he would only spoil the fun."

The boys finally went away very much disappointed. With two dogs they were anticipating a grand rabbit hunt.

Mrs. J. E. M.

Editor Forest and Stream:

Long experience has taught me that there is little use in argument with a confirmed believer in reasoning powers of animals; as a rule, they seem to believe this because they want to. Occasionally you will meet one like Rev. Chas. Josiah Adams, who believes strongly, but can admit weight in an argument against it. But generally the type of your various anonymes is the ruling one.

A sample error is that of "De Canibus," with the dog that carried the cat to the rathole. On that one incident, without any investigation into previous experiences of that dog, he deduces reasoning powers. Would any reasonable man arrive in a similar way at conclusions as to another man's acts? Then why assume reasoning in the dog, with the stubborn facts of animal inability to comprehend processes so simple that the Andaman Islander understands them? A course of Lloyd Morgan on Comparative Psychology or thoughtful study of Profs. Wm. James or Hugo Munsterburg, would often be useful.

W. WADE.

New England Fox Hunting.

Editor Forest and Stream:

Having read many interesting articles in your publication during the past few years, and believing that "variety is the spice of life," I take the liberty of contributing a few lines on the subject of fox hunting.

I have had a taste of bird and duck shooting in various sections of New England, and have hunted rabbits and white hares with beagles, but never have accomplished anything which gave such satisfaction as to see the faithful hounds rush in at the finish after following the trail several hours over mountains and through swamps, covering a distance perhaps of fifty or seventy-five miles.

As a health-giving pastime, fox hunting is superior to bicycling, or any of the indoor sports. What is better for a man than a walk through the country on a fine autumn morning? Being refreshed with the pure air, rich in ozone, he easily climbs to some high elevation, where he can listen to the baying of the hounds, and feast his eye on a scenery more beautiful than any view ever depicted by an artist.

Fox-hunting, like any thing else, must be carried on properly in order to be satisfactory or in any way recreative. I hope that no one can mention anything more disgusting than to find the dogs, after half an hour's chase, wandering about some sandy road, entirely ignorant of the direction in which sly Reynard has made his escape. In order to have a good hunt one must have good dogs, and, of course, go where foxes can be found.

During the fall of 1898 Mr. E. H. Langdon and I visited the hunting ground twenty miles from Boston about one day each week for ten weeks. Although several foxes ran in and the dogs were found digging at the burrows, six were killed with the gun. With one exception each fox had been chased five hours or more before being shot.

In one instance the fox and dogs swam across a river a distance of 40 or 50 yds. At another time the dogs, while beating a cold trail, came up to the river, swam across and picked up the trail on the other side, starting the fox half an hour later, showing unmistakable evidence that the fox crossed at this point without being pursued.

We use two black and tan hounds. These dogs were bred from good hunting stock, but have no gilded pedigree. They have good noses and are reliable. Mr. L. uses a Parker gun, 12-gauge, 30in. barrel, weighing 7½ lbs., while I carry a Remington ejector, 12-gauge, 29in. barrel, weighing about 7½ lbs. Some prefer heavier guns for foxes, but we had no trouble in killing every fox at which we shot.

One fine morning, late in October, Mr. L. and myself

set out for a hunt at Andover Hills, about ten miles distant. An early start brought us to the fox grounds well before daylight. My experience has shown that one of the prime essentials of bagging foxes is to get the trail in the early morning hours. Day had scarcely begun when old Tip gave tongue in a swampy meadow, about a quarter of a mile distant; Young Drive was soon with him, and the prospect of a good day's sport seemed assured. The trail led out of the swamp and through a bushy pasture and pine grove; thence to a big hill nearly two miles away, the scent growing steadily better until finally they "jumped" the fox, and the music began in earnest. A white frost makes the very best of going for them. Mr. Reynard knew his business and made off in a practically direct line for his base of operations, which proved to be a group of ledgy hills about five miles to the north-west.

In less than twenty minutes the dogs had gone beyond hearing distance. Here was a predicament, and not an uncommon one, either. The dogs were out of hearing and in a strange woods.

Now the question arose, Shall we wait where we are or go on toward where the dogs were last heard? My plan is invariably to press on with all possible haste, halting only when it seems likely that the fox is heading my way. I know many practical hunters who prefer the waiting plan, believing that the game is sure eventually to bring up at the original starting point. This may do in some cases, but the chances are far better, to my mind, not to wait, for these reasons: First, if you are spry, you will hear most of the drive, which is the main thing. Second, the fox always has his favorite locality for throwing the dogs, usually distant from the starting point, and will frequently hang there for hours. Third, he may bur-

DR. E. H. NILES.

row, and then one never knows for a certainty how the hunt ended. Fourth, some gunners outside of your party may shoot the game and you be none the wiser. Fifth, it encourages the dogs to know that their masters are likely to show up in the chase at any time, besides giving you an opportunity to aid the younger dogs in hard places. Sixth, it gives a man an opportunity to enjoy a little target practice on the various mongrels that are continually pitching on to foxhounds. Seventh, the exercise is much better for one's health and peace of mind than long, uncertain waiting.

After almost an hour's tramping in a northerly direction, the voices of the dogs are again heard, coming nearer for a while, but, hark! The barking becomes faint, but it is easily seen that the fox has changed his course to a westerly direction. We push on. After following some hours we come to a road, and a house is soon sighted. It is now eleven o'clock. We meet a farmer and learn that we are six miles from the starting point, but we have not tramped in vain. The dogs are barking furiously in the big woods at the right. The fox is no longer running in a straight course, but is making short circles. Now is the time for action. We separate and push cautiously into the woods. No noise is made, as the snapping of a twig would frighten Reynard out of the country. The dogs seem to be getting closer. There is no time for tricks or loafing now. Our guns are kept ready, for it would be a shame to miss the fox when the dogs have worked so hard. The game seems to be in the direction of Mr. L. It is strange that I do not hear his gun; but he has not had an opportunity to shoot. It is only a moment before I hear the dogs coming straight toward me. Looking at the right I see the victim running on a stone wall. He sees me at the same time and makes a spring for the bushes on the other side, but it is too late. He receives the charge of BBs from my gun.

It is but a moment before the dogs are in sight. I have not seen them for six hours, the fox having run under cover the most of the time. Their speed is increasing; the trail is so fresh that they do not put their noses to the ground. Both dogs are very warm and Young Drive's tongue is lacerated and bleeding, having been caught on a sharp stick or briar, but they care not; they have found the fox and are shaking him savagely. At this time I go up to the dogs and give them a morsel of

meat. Mr. L., having heard my gun, comes in soon. We secure the brush shortly and set out for the wagon, feeling more than pleased with the day's outing.

DANVERS, Mass.

Importation of Dogs into Great Britain.

THE following note, dated Washington, March 28, 1899, has been received from the British Ambassador:

"Sir: with reference to my note of May 29, 1897, I now have the honor to forward to you a copy of a further memorandum issued by the Board of Agriculture on the subject of the importation of dogs into Great Britain.

"In communicating this memorandum to you, I am directed by Her Majesty's Principal Secretary of State for Foreign Affairs to ask you if, in view of the fact that the regulations embodied in the memorandum in question are framed with a view to stamping out rabies in Great Britain, you would be so good as to cause them to be generally known to all persons concerned.

"JULIAN PAUNCEFOTE."

HON. JOHN HAY, etc.

The memorandum states that the importation of dogs without licenses is forbidden. Application for license must be made to the Secretary, Board of Agriculture, 4 Whitehall Place, London, S. W., in time to permit the board to inquire into the circumstances of the application, etc., before the embarkation of the dog takes place. Dogs will be detained for six months, under supervision of the authorities, on some suitable private premises specified by the owners. If the conditions imposed are properly carried out, the board will consider applications, accompanied by the certificates of veterinary surgeons, that the dogs are not suspected of rabies, for their release after ninety days. Dogs whose antecedents are unknown will be subjected to longer periods of detention. In exceptional cases, the board will entertain applications made by telegram, on condition that a full description of the dog will be given and the place in which he is to be detained specified.

For the convenience of persons passing through Great Britain, the board in special cases will authorize the landing of dogs which are to be exported in a few days. In making application for such license, the ports, names of the vessels, and dates of arrival and departure must be specified, and the address of some suitable place where the dog can be detained during the period it remains in Great Britain, which must not exceed ten days.

Points and Flushes.

A CORRESPONDENT inquires of us this week concerning who are breeders of well-bred bloodhounds. We regret our inability to furnish the information, as none advertise that they have them for sale.

Volume XV. of the American Kennel Stud Book, which contains the registration of 1898, numbered from 46,328 to 49,976 inclusive, is neatly printed and well bound in cloth. Besides the registrations, it contains a list of the active members, bench shows, bench show winnings, cancellations, champions of record, corrections, executive board, field trials, kennel names, prefixes and affixes, officers of the American Kennel Club, officers and membership of the associate members, standing committees, active members, etc. Mr. A. P. Vredenburg, secretary, 5 Liberty street, New York.

Yachting.

Gasolene Engines and Launches.—V.

BY F. K. GRAIN.

(Continued from page 255, April 1.)

LINES.—Modern practice in designing tells us that the water lines should be as straight as possible with no hollow lines, and it is certain that this rule will give a very able, fast and burdensome boat. It is an established fact that there is nothing gained by cutting away into too much hollow and what look like sharp lines.

Another point is as to the dead rise or sharpness of the bottom midship, it being a great mistake to suppose that a boat running down at a sharp angle of the floor to the keel will give any increase of speed.

In order to make the draft of a hull as light possible a certain amount of beam is required, combined with a long flat floor. For all around use the best combination is a boat of good freeboard and ample beam; of course, as the beam is increased it adds to the displacement, which means increased resistance, which in turn means an addition of power to maintain the same speed.

It is by far better and more satisfactory to have too much than insufficient power. Of late there has sprung up quite a demand for square stern launches, particularly under 30-ft. These boats have all the appearance of a common square stern boat, when afloat, but they will be found to be cut away under the stern, allowing room for the propeller wheel forward of the line of stern post. The advantage of this model is that they are very burdensome, their actual water line length being equal to a boat having an overhang of much more length over all. For instance, a square stern launch of 20ft. over all will in its area of under water body equal a 24ft. overhang stern boat. This is, of course, supposing the boat with the overhang to be of the usual type of round or elliptical stern. In addition they are somewhat cheaper to construct and are, if properly designed, very strong and free from vibration.

PAINTING.—To begin this subject, we have first of all to caution you against the use of too much paint, and especially if put on too thick. There are more boats suffering from too much paint than too little, and nothing will give a new boat the appearance of an old hulk quicker than plastering it over with thick paint.

In painting a new boat white, for instance, we first take the white lead and mix with turpentine to the consistency of thick pudding; then allow this to stand overnight and in the morning pour off carefully the oil and

turpentine that has risen to the top. The lead is then ready to cut up with more turpentine to about the consistency of thick molasses, then add sufficient good raw linseed oil to bring it thin enough to spread and flow well, adding to each quart of paint about half a tea cup of best varnish. The varnish acts as a dryer and will make paint very elastic and durable. If the paint works hard and does not spread well add a little turpentine, but care must be taken to put it in sparingly and stir it well.

To mix colors proceed as for white lead. For painting black, either coach, drop or ivory black ground in oil are most used. Mix as for white paint, but remember that about one-quarter of the quantity will cover the same space. All blacks should be well rubbed out under the brush. When the boat is new it is best—if painting white—to put on three to four coats, applying all coats thin and giving each coat plenty of time to dry. By this means the surface will be of uniform thickness and all small cracks, pricks, etc., filled, and will make a coating that will not peel or crack. All puttying should be done after the first coat, and each of the succeeding coats should be lightly rubbed with curled hair or excelsior. Never mix paints, especially for the outside, that will dry very hard, with an excess of gloss, as it will not wear off or chalk, but cracks and peels, which soon makes it necessary to burn off the old paint; whereas, if the paint chalks or washes off a little it will by the time repainting is necessary have left the wood smooth and easy to sand-paper.

PUTTY.—Putty is best made of white lead thickened with selax, or when that cannot be had whitening will answer. For the garboard and all seams under water a good strong putty made of white lead thickened with red is best. Never put putty in with the finger as it will leave the surface hollow. There are places such as the chafing ribbons, rails, etc., where it is difficult to make putty stay; in such cases use the best pure beeswax, putting it in hot.

BOTTOM PAINT.—The under water body should be given two coats of red lead, using three parts red to one part of white. It should be well rubbed under the brush. This will form a good body and hold for the necessary two coats of anti-fouling paint to finish. There is very little or any choice between the different brands of copper or anti-fouling paint, success in their use depending mostly on the care used in applying them.

In using these paints it is necessary to keep them continually stirred while applying, which, owing to the weight, can best be done by a piece of iron or iron pipe and should be well rubbed out. None of these paints should be put on until just before the boat is ready to launch as the paint deteriorates when left exposed to the atmosphere. Some use white zinc and English white lead, which without doubt gives a very fine job, but we think that with proper use the best American leads will be found to answer all requirements. Various patent paints and enamels are offered but they are not suited to marine work, especially on salt water. When colors are used the finish and durability can be greatly improved by finishing with a coat of good spar varnish.

ENAMEL PAINT.—If an enamel paint is wanted it can be easily made by extracting as much as possible of the oil from white lead by use of turpentine, then add coloring to suit and thin with a Damar varnish; it should be applied hot if possible, to do which place the can in a vessel containing hot water and let it remain there while in use.

Two or three coats are generally necessary and it should be rubbed with curled hair between each coat. In cleaning, scraping and sandpapering a motor to renew paint great care must be taken to cover all bearings and plug up all oil holes, otherwise particles of paint are liable to work in and ruin the working parts.

VARNISH.—We now come to varnishing, and first off we will assume we have new wood to finish. To begin with the wood must be thoroughly scraped with a cabinet scraper, then cut down with fine sandpaper. We now take wood filler, which can be bought ready for use, and after thinning with turpentine brush it in thoroughly. If on hard woods of open grain, like oak or ash, the filler is mixed moderately thick, then when the filler begins to set it must be thoroughly rubbed down with excelsior or rags. If on soft woods of close grain, such as pine, cypress, etc., the filler can be applied quite thin, and after it is thoroughly dried rub it with fine sandpaper. All fillers show up white on wood when dry but disappear on applying varnish.

After the filler is thoroughly dry and rubbed smooth apply a good coat of varnish, rubbing it on well and being careful to cover all spots; when this is perfectly hard then take curled hair or pumice stone and water and rub all the gloss off so that the surface has a dull appearance, it is then ready for the finishing coat which must be put on evenly and of good body. This will give a fine finish, but can, of course, be improved by application of more coats, rubbing each coat as before. Care must be taken not to have the varnish chilled, and if in that state warm it by putting on hot water. Varnish should not be applied when the temperature is below 56 degrees or on exceedingly hot days, and it should not be exposed to excessive heat of the sun.

All spar varnishes are slow drying and if applied indoors are sometimes weeks in drying, it is then far better for the rubbing coats to use good quick drying varnish and then on a good day apply the spar varnish out doors. Never varnish toward night as the dampness will spoil the best varnish. If a very fine finish is desired rub the last coat with pumice stone and water and polish with oil; this will give a surface that will not scratch and can be kept in first class order by an occasional rubbing with a piece of oiled waste. To revarnish old work the first thing is to scrape off as much of the old varnish as possible. When there is much of the old varnish left ammonia will be found a great help in removing it. Take a rag or piece of waste, dip in the ammonia, then rub over a few feet of the surface to be scraped. Let this stand for ten minutes when it will be found very easy to scrape. By doing but a small piece at a time, that is allowing a patch to soak while the last is scraped it will be found to work easily and quickly. After having thoroughly scraped the old surface cut it down smooth with fine sandpaper. Fine sandpaper will be found to cut faster and better than coarse.

If the wood is now bare apply wood filler and proceed

FAST CRUISER OF 25FT. L.V.L., DESIGNED BY WM. H. HAND, JR., 1899.

as on new wood, but if there still remains some varnish apply a rubbing coat and then a finishing. If there are any checks, cracks or open joints in old work fill same with beeswax before varnishing.

Having now explained the necessary painting operations we have to say a word in regard to paint and varnish brushes. These should be selected with care, and above all beware of cheap brushes, it is impossible to do a good job with cheap tools.

PAINT BRUSHES.—Most every paint brush will shed when new, and to prevent this soak the brush in water for a day or two before using.

Most new paint brushes are too long and it is customary to wrap or wind with good string from half to one inch of the brush, beginning from the bolster or butt, taking care to pull both ends through the wrapping so that they can be tied around the butt of the handle, which prevents the wrapping slipping down as it otherwise will do.

CLEANING BRUSHES.—After using brushes should be cleaned and put in water. Bore a small hole through the handle, through which run a stout wire and by this means suspend the brush in the water so that it does not touch bottom. This will always keep the brush straight and in good order. Turpentine is good to clean brushes but the writer prefers kerosene and afterwards thoroughly rinse with naphtha or gasoline, as they can then be laid

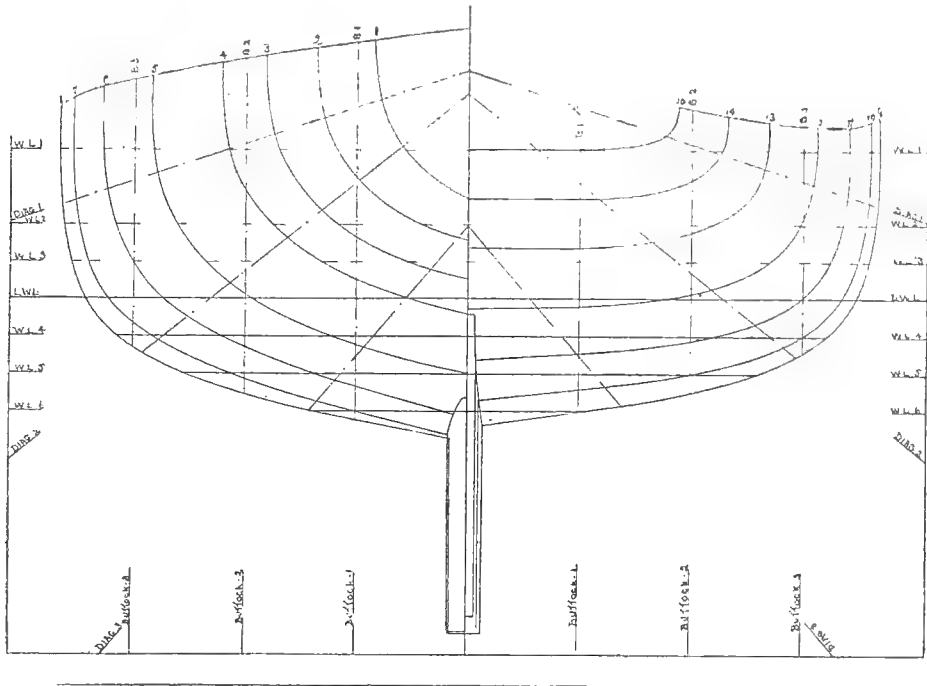

damp rot and also keeps the boat from becoming saturated from the smell of drying bilge water, etc. A very good plan is to take up the floor pieces and give the entire run a coat of whitewash, it being a good disinfectant and preserving the wood. Owing to dryness and wind the under water body of a boat laid up is very liable to check, particularly the stern post, dead wood, keel and stern. This can in a great measure be prevented by giving these parts a good heavy coat of equal parts of raw and boiled linseed oil with a small part of Japan dryer.

In launching the same process is reversed, taking care in both cases that the boat is not allowed to run back, as in that case the result is almost sure to be a broken rudder or skeg, at the very least. In order to avoid tearing of cleats, chocks, etc., run a bridle around the entire boat and fasten the hauling tackle to that.

[TO BE CONCLUDED.]

A 25ft. Fast Cruiser.

THE yacht here illustrated, recently designed by Mr. Wm. H. Hand, Jr., of the Buzzards' Bay Yacht Agency, New Bedford, is similar in model to the 21-footer recently shown in our pages; but the increased size brings her into a class where it is possible to obtain more than

away and allowed to dry. If the brush becomes clogged or an accumulation of dry paint on the outside hold the brush down flat on a board, then take a putty knife and scrape it down, holding the knife at an angle as if you were going to scale up, do not be afraid to bear down and push hard on the knife, it will not cut the bristles, after the brush has been once in use. In using a seam brush do not allow the paint that necessarily gets on the outside of planking to dry but wipe it off at once, otherwise it will show, no matter how many coats are given to cover it.

OLD PAINT.—Do not use either paint or varnish that is not fresh, as both become grimy by age, and although dealers will say it does no harm we know to the contrary and good fresh materials cost no more than old stuff.

HAULING OUT.—Hauling out is always attended with some risk of damage, and to avoid accidents everything should be provided in order that no makeshifts have to be used. After selecting the locality, which should be some place protected from northwest winds, a temporary ways should be laid, which may be made by laying down some joists or good stout planks which can be held in place by driving a few stakes on each side and nailing these to the ways. When the ground is uneven it will be necessary to shore up under the ways where they are liable to bend.

The next things required are some wooden rollers, although if these are not at hand old iron pipe will answer, but this is liable to damage the keel unless it is provided with a shoe. Haul the bow out on one roller and as it works aft keep putting other rollers under, taking care not to allow the whole weight of the boat to rest on any roller or rollers under the midships only but to distribute the weight as much as possible.

When there is no cradle for the boat to rest in it is sometimes customary to have sufficient help to hold the boat up on an even keel. This makes a lot of unnecessary trouble and often results in the boat being dropped. By far the best plan is to have a good plank, lay it under the bilge parallel with the keel and so it will rest on the rollers, now take a gunny sack and fill it with hay or shaving and place it on the plank, allowing the bilge to rest down on it thereby avoiding to have to keep the boat on an even keel. A good four-part block and fall is generally all that is necessary for hauling power. This can be fastened to a stake driven in the ground if nothing else is at hand. If this is not sufficient a watch tackle can be rigged. This is done by taking two sets of tackles, making the hook of the first fast to the hauling part of the tackle on the boat, thus by hauling on the first you have the entire power of the first tackle to haul on the original tackle. Care should be taken to keep the boat from getting off the rollers. When in proper position shore up with good blocking at each end and also midships, taking care, however, that the middle blocking does not bear as hard up under the keel as the ends, as should the end blocking settle it will throw the bulk if not all the weight on the middle blocks, which will cause the boat to hog. Good substantial shores must be so placed as to keep the boat on even keel.

The next thing is to drive out the bilge plugs or open the sea cock, as the case may be, in order to allow any rain water to escape, after which the boat is ready to be covered with anything at hand. If canvas is used for covering an air space should be left in order that a circulation of air can enter the boat, which prevents dry and

mere day accommodation, and she is both able and roomy enough for general cruising about the Sound and the eastern coast. Her dimensions are:

Length—	
Over all.....	39ft. 9 1/2 in.
L.W.L.....	25ft. 1 1/2 in.
Beam, extreme.....	11ft. 1 in.
Draft—	
Hull to Rabet.....	1ft. 10 in.
Hull without board.....	4ft. 6 in.
With board.....	7ft.
Freeboard	
Bow	3ft. 7 1/2 in.
Least	2ft. 3 1/2 in.
Counter	2ft. 8 1/4 in.
Displacement	13,000 lbs.
Ballast, in keel.....	4,500 lbs.
Sail area.....	900 sq. ft.

The construction is strong and substantial, and thoroughly durable, but at the same time it is simple and not specially expensive. The keel is bent from a 4 in. plank of oak, sided 4 in. where it scarfs to the stem just forward of the water line, increasing to 10 in. amidships, and tapering to 4 in. again at the transom. The frames are of oak, 1 1/2 by 1 1/2, spaced 10 inches, the clamps are sided 3 in. and moulded 2 in.; the bilge stringers are of yellow pine. The upper strake is of oak and the rest of the planking is of a long-leaf yellow pine, 1 in. thick, in single lengths, the plank sheer is of oak, 1 1/2 in. thick, 3 1/2 in. in the middle and 2 1/2 in. at the ends, with deck sprung to side line of 2 by 1 1/2 in. white pine. The cabin trunk is staved up with 1 by 3 in. matched pine, sheathed inside and out with 1/4 in. white pine; the top, of 1 by 3 in. matched pine, being covered with canvas. The outside keel, 4,500 lbs. of iron, is fastened with 14 bolts, 3/4 in. each, set up on top of the cross floors, of oak, 3 by 4 in. across keel.

The cabin is uncut by the trunk, the board housing entirely below the floor, with a wire pendant leading to the cockpit. The headroom is 5 ft. 5 in. and there are two lockers, each 10 ft. 6 in. long. On the port side forward is a small toilet room and opposite to it is a snug galley, with lockers, racks, etc. The space in the cabin is very well utilized, with lockers and transoms. There is a wardrobe on each side against the after bulkhead. There is little headroom in the forecabin, but otherwise there is good room for one hand. The sail plan includes main-sail and jib, a total of 900 sq. ft., with bowsprit 4 ft. 6 in. outboard and boom about 4 ft. abaft end of counter.

A Sailing Dinghy.

The little dinghy here illustrated was designed by J. Wilton Morse, Esq., of Toronto, for vacation sailing on Georgian Bay, in a part which is a perfect network of islands, narrow channels, rocks and reefs. The boat was intended to carry three comfortably, to beat to windward through long channels only a few yards wide, and to be easily launched and housed by one man. All of these ends have been successfully attained, the boat has proved very handy, and quite fast under a small rig. She is dry and stiff, and easily carries a fourth person. The centerboard is of wood, weighing about 125 lbs. As shown in the plate, she has a man of 160 lbs. aft and a 75 lb. sand-bag in the bow. She would make an excellent dinghy for a yacht.

Dimensions of sailing dinghy:

Length—	
Over all	12ft.

Sept. 6-7.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The programme of the Interstate tournament, to be held at Oil City, Pa., under the auspices of the Oil City Gun Club, May 17 and 18, provides ten events each day, 15 and 20 targets, \$1.50 and \$2 entrance, respectively. All purses are divided on the equitable system. Guns and ammunition forwarded to Mr. F. S. Bates, Oil City, will be delivered on the shooting grounds. Price of targets, 2 cents, included in all entrances. Lunch will be served on the grounds. The Interstate Association rules will govern. The Interstate Association's manager, Mr. Elmer E. Shaner, 122 Diamond Market, Pittsburg, will manage the tournament.

At the March shoot of the Florists' Gun Club, of Philadelphia, which was the last of that series, Messrs. Anderson and Harris tied on 15 points for the year. At the last shoot, April 4, the tie was shot off, Anderson first, Harris second; scores 48 to 45.

IN NEW JERSEY.

Boiling Springs Gun Club.

Rutherford, N. J., April 1.—The scores made at the club shoot to-day were as follows:

Paul	00111011100011111111001-17

Indiana Trap-Shooters' League.

PERU, Ind.—Editor Forest and Stream: The Indiana Trap-Shooters' League having sanctioned the dates for our third annual amateur tournament, to be held at this place on May 2 and 3, 1899, I desire to take this opportunity to explain to the many sportsmen who have heretofore attended our tournaments that this change in date from the last week in April to the first week in May has been made on account of the superior hotel accommodations to be had at Peru during the latter week as compared to the former.

Heretofore when our tournaments were held the last week in April, our hotels were filled with the attaches of the Wallace circus and menagerie, which makes its annual start from this place, and therefore the addition of some sixty to seventy-five sportsmen made the accommodation somewhat crowded. As to our tournament, it will be held upon the same lines exactly as was our first two, in 1897 and 1898, which were such unequalled successes, the entries running over fifty and averaging at both tournaments about forty each day. The management is now endeavoring to secure reduced rates on the two railroads entering Peru, and will announce the same in the programmes, to be out about April 20 to 25. As our annual tournament always sounds the opening gun for the Indiana Trap-Shooters' League season, and as we have within a radius of about 100 miles some 250 to 300 amateur shooters, we expect the usual large and enthusiastic attendance, especially as the sportsmen will understand that the tournament will be run upon the same lines as heretofore, being strictly an amateur affair, but amateurs from any part of the State are welcome.

Louis D. REAM, Sec'y.

The dates of the Ohio Trap-Shooters' League tournament, Mr. J. C. Porterfield, the secretary, informs us, have been changed from June 7-9 to June 21-23.

ON LONG ISLAND.

New Utrecht Gun Club.

Woodlawn, L. I., April 8.—Mr. Horn was a guest. The scores made at the club shoot to-day are as follows:

No. 1, club shoot:

Brooklyn Gun Club.

Brooklyn, L. I., April 8.—The main event was a handicap prize shoot, event No. 5. Messrs. J. S. Wright and Mr. Lane tied, and divided in it.

There were several matches at 25 targets between Messrs. J. S. S. Remsen and Harold Money, the latter winning most of these contests. In a 50-target race between H. Money and W. Brentford, the latter won by 3 targets. No. 3 was at 15 singles and 5 pairs:

WESTERN TRAPS.

East Bound.

CHICAGO, Ill., April 8.—The Du Pont-Hazard Smokeless Powder Express, composed of five cars, under charge of E. S. Rice, will start East for the Grand American Handicap over the D. & O. Ry. this afternoon. The following is the list of those making up the party up to last night: H. E. Bollenstein and V. F. Bollenstein, Cambridge, Ill.; Ed Bingham, Chicago; Dr. Brown, Ramsey, Wis.; C. T. Carlson, Cummings, Ia.; H. G. Carter, Janesville, Wis.; H. P. Collins, Baltimore, Md.; T. H. Conron, Pleasant Hill, Mo.; Guy V. Dering, Columbus, Wis.; Albert Dunnell, Harry, Dunnell, William Dunnell, Nippersink, Ill.; Otto V. Ebnessor, New Albany, Ind.; Dr. W. H. Gragg, Memphis, Tenn.; Charles M. Grimm, Clear Lake, Ia.; William Harraugh, Geneseo, Ill.; Frank Harrison, Koshkonong, Wis.; W. A. Henman, Pekin, Ill.; C. C. Hess, Riverdale, Ill.; H. C. Hirschey, St. Paul, Minn.; Samuel Honman, Jr., Atlanta, Ia.; J. J. Hanowell, Bridgeport, Conn.; Thomas A. Marshall, Keithsburg, Ill.; W. F. Meidroth, Peoria, Ill.; A. L. Miller, New Boston, Ill.; C. C. Nauman, San Francisco, Cal.; F. R. Patch, Hartley, Ia.; James O'Brien, Dubuque, Ia.; L. H. Owen, McHenry, Ill.; K. S. Rockwell, Columbus, Wis.; W. P. Shattuck and Mrs. W. P. Shattuck, Minneapolis, Minn.; Dr. J. W. Smith, St. Louis, Mo.; A. D. Sperry, Rock Island, Ill.; F. M. Stockton, Hannibal, Mo.; Victor Studeny, Neponset, Ill.; John J. Sumpter, Jr., St. Louis, Mo.; William Talley, Henderson, Ky.; D. V. Tantlinger, Iowa City, Ia.; Edward Voris, Crawfordville, Ind.; Ralph Valentine, Monroeville, O.; John Watson, Grand Crossing, Ill.; Otto Zwery, Sheboygan, Wis.; T. P. Laffin, Rock Island, Ill.; Dr. Kibbey and John A. Lane, Marshalltown, Ia.; John C. England, Mount Pulaski, Ill.; E. E. Neal, Bloomfield, Ind.; Frank L. Snyder, Crawfordville, Ind.; John A. Samuelson, Ophiom, Ill.; Mrs. S. P. Murrey, Stillwater, Minn.; A. H. Bogardus, Lincoln, Ill.; C. L. Clark, Nora Springs, Ia.; W. S. Knapp, Sioux City, Ia.; Al Leimer, Little Rock, Ark.; J. F. McAuley, Osceola, Ia.; J. W. McCurdy, Kansas City, Mo.; H. H. McKinney, Janesville, Wis.; H. C. Mortenson, Britt, Ia.; Dr. F. E. Morris, Dixon, Ill.; Robert Wood, Chicago; James F. Powell, Ottumwa, Ia.; F. W. Ramaley, St. Paul, Minn.; E. J. Seance, Sidell, Ill.; J. G. Smith, Algona, Ia.; Dr. J. W. Smith, and Mrs. J. W. Smith, St. Louis; Dr. J. L. Williamson, George L. Deiter, John Plankinton, Jr., and Stephen Muenier, Milwaukee; C. B. Dicks, E. Bingham, T. P. Hicks, W. B. Leffingwell, S. Palmer, A. C. Paterson, Dr. S. Shaw, E. S. Rice, F. P. Sannard, J. B. Barto, Dr. W. F. Carver, W. F. De Wolf, R. Wood, E. M. Steck and Mr. and Mrs. C. P. Richards, Chicago; Fred Gilbert and Russell Klein, Spirit Lake, Iowa; Joseph Kirsher, W. R. Milner and George McCartney, Des Moines, Ia.; F. E. and F. M. McKay, Minneapolis.

A few of the East-bound shooters have been in Chicago, and have taken occasion to do a little practicing at Watson's. On April 5, Mayor Tom Marshall, of Keithsburg, killed 15 straight with ease, and looked as though he would kill them all at Elkwood. On the day after the following scores were shot among others: O. Zwerg 20, B. Tantlinger 14, J. C. England 21, J. Hollowell 13, J. Kirsher 20, C. Nauman 21, V. Bollenstein 24, J. O'Brien 22, A. C. Paterson 21, Mrs. Murrey 16, Mrs. Shattuck 13.

Milwaukee Clubs.

In its last weekly shoot the Wisconsin Gun Club, of Milwaukee, made the following scores, at 25 targets: Hunnestein 18, Klapsinski 13, Horlick 18, Rohn 16, Mulien 16, Hunnestein 20, Horlick 21, Klapsinski 20, Meunier 18, Rogers 11, Figue 17, Paul 16, Borax 14, J. Meunier 16, Figue 17, Rohn 21, Paul 12.

The Wisconsin Gun Club has been presented a silver loving cup by a Milwaukee firm, which will be put in competition next summer, under conditions later to be determined. On last Monday members of the North Side Gun Club, of Milwaukee, made the following scores, at 25 targets: P. Pinter 23, H. Haehn 20, Peters 19, A. Krause 18, B. Schroeder 17, Klemme 16, E. Schroeder 16, W. Gaulke 22, C. Imse 20, J. Trapp 19, A. Klomann 18, Imekus 17, P. Schwartz 14, D. Peters 14.

Lincoln Amateur Shoot.

The Lincoln Gun Club, of Lincoln, Neb., starts off the season with its second annual, April 18-21. This is "amateur vs. amateur," and the club hangs up the pleasant prospect of "free targets, choice merchandise and gold coin, equal to \$1,250 added." Professionals and agents are barred from the purses. The co-operative plan adopted by the management of this shoot is something unique in its way, and should be added to the different ideas which have been advanced by tournament managements with the intention of bringing out and holding in the crowd. It is set forth as below:

"In presenting the programme of our second annual amateur tournament, we desire to state that we announced our dates almost a year ago, and it has been our one ambition to give the amateur shooters of the Middle West a strictly high-class tournament, and we believe you will agree with us that we are unselfish in our decision to throw targets free. Without doubt, it is a great thing for the shooters, but what about the club? We will answer, that the wide-awake, reliable manufacturers and sporting goods dealers, as well as the leading business men of our city have assisted us in the purchase of targets, issuing of programmes and many other expenses a club are subjected to, but there is still another expense—the running expense of the tournament must be met. This amount we must pro-rate among the shooters by taxing them a small amount to make up a fund to defray the expenses, which amount will be governed by the number of shooters attending, but shall not exceed \$1 per day. Let us see what effect this will have on the shooter. Take, for example, a basis of seventy-five shooters, ten events per day, \$1.50 entrance with \$500 added, and deducting the usual amount for

targets, the total purse for the three days would be \$2,792.50, and your entry would be \$15, which, with our free-target system, the total purse for the same number of entries and events would be \$3,315, and your entrance would not exceed \$18, thus for the small amount you contribute to the running expenses of the shoot you are permitted to contest for an additional purse of \$532.50.

"Figure the system on any basis you desire, and it will stand the test. We send greeting to our friends and trust you will be with us April 18, 19, 20 and 21, 1899."

E. Hough.

1200 Boyce Building, Chicago.

Boston Gun Club.

Poston, Mass., April 7.—The first shoot in new prize series and the pleasant day drew fifteen shooters to Wellington, Wednesday, April 5. Henniker, N. H., South Weymouth, Campello, Fitchburg and Haverhill, Mass., were all represented, the latter club sending three members, Messrs. Tozier, Miller and George, to sample Boston Gun Club conditions, and later in the evening the Boston dog show.

Everybody enjoyed themselves, though only one shooter, Mr. Allison, could be said to have made a good average. He broke 86 per cent., doubles and all, from 18 yds. rise, and generally speaking, when he was through with a target there was nothing left of it.

It is well, however, that average is not the whole show. Somebody must lead, but there are many who never do. The shooter breaking 40 per cent. has the same amount of fresh air, sunshine and rest from business cares as he who attains 80, and quite often for a beginner 40 represents just as much, if not more, improvement than the higher figure.

Scores as follows:

Events:	1 2 3 4 5 6 7 8 9 10 11

April 8.—Eighteen shooters tested a magautrap this afternoon at Wellington on the grounds of the Boston Gun Club. Perhaps two of the eighteen were fully confident of its success; the other sixteen were on "de fence." The fence at first was a very good place to be but the evolution of one squad evened out the "kinks" and afterward nothing could be more perfect than the manipulation of the targets.

The shooting was found a little different from ordinary, and for that reason the scores appear slightly off center. In a practice team match between Harvard Shooting Club and Boston Gun Club the home team had three of its good men depart woefully from their beaten paths of percentage, and naturally lost to their opponents by 11 targets. Miskay and Woodruff managed high scores for Boston; the Harvards shot altogether a more even pace, and considering it was their first trial of an entirely new system, did very well.

Mr. Woodruff was on this occasion B. G. C. gold watch charm, won in the prize series just finished. The design, like that of preceding series, is a prettily fashioned strap and buckle, engraved "Boston Gun Club," forming edge for raised circle, engraved, "Spring Prize Series, 1899," the plain back simply ornamented, "Won by G. Woodruff."

Florists Gun Club, of Philadelphia.

PHILADELPHIA, Pa., April, 4.—The contest for the president's cup, held to-day, 2 unknown from magautrap and 25 known from expert traps, resulted as follows:

G. A. H. Entries.

THE entries to the Grand American Handicap number 266, an increase of 65 over those of last year, after the closing and before the post entries were received. There were 6 post entries last year, which brought the total up to 207.

The competitors are numbered in the order in which they will shoot, and their addresses and handicaps follow their names:

No.	Name and address.	Yards.
1.	W S Edey, New York.	27
2.	F P Stannard, Chicago, Ill.	28
3.	T H Cohron, Pleasant Hill, Mo.	27
4.	E B Puck, Boston, Mass.	26
5.	A L Ivins, Red Bank, N J.	28
6.	James Atkinson, Newcastle, Pa.	26
7.	J Thomas, Georgetown, Me.	26
8.	Geo W Clay, Austerlitz, Ky.	28
9.	Harry Dunnell, Nippersink, Ill.	28
10.	Justus von Lengerke, Orange, N J.	28
11.	Sporting Life No. 2, Philadelphia.	28
12.	Frederick Bucklin, Worcester, Mass.	28
13.	J J Sumpter, Jr., Hot Springs, Ark.	27
14.	Neaf Appgar, Plainfield, N J.	29
15.	G W Schuler, Cincinnati, O.	29
16.	James H Campbell, Franklin, Tenn.	25
17.	T A Marshall, Keithsburg, Ill.	29
18.	J H Van Mater, Atlantic Highlands, N J.	29
19.	Also Ran, Philadelphia, Pa.	29
20.	B F Popham, Memphis, Tenn.	26
21.	John Parker, Detroit, Mich.	29
22.	Dr J Hood, Brooklyn, L I.	29
23.	A Williams, Scranton, Pa.	29
24.	J S Fanning, San Francisco.	30
25.	Fred Coleman, Hedges, Pa.	28
26.	J Snell, Worcester, Mass.	28

Mr. Edward Banks, secretary of the Interstate Association, sends us the following interesting information:

The entry list for the Grand American Handicap shows a total of 266 entries. Of course this number will be increased before the time arrives for commencing the shoot by a certain number of post entries, so that the probable number of entries as a whole will be 275. It is extremely likely that some ten or a dozen will forfeit their entry fee, so that it may be taken that the total number of shooters who will toe the mark on April 12 will be about 260. This would show an increase of 63 shooters over last year, when the total entries amounted to 207, 197 of which actually competed in the Grand American Handicap.

In 1897 there were 146 entries with 135 shooters. In 1896 there were 109 entries with 104 shooters. This shows that the average increase each year has been steadily maintained and is conclusive proof of the popularity of the Grand American Handicap with the shooters of this country, and with the policy of the Interstate Association in the matter of division of the purse.

The conditions are 25 birds, \$25 entrance, birds extra, handicaps from 25 to 35yds.

This year the handicap committee, which was made up as follows: Jacob Pentz, B. Waters, W. R. Hobart, Will K. Park, C. W. Budd and E. E. Shaner, decided to place no shooter back of 35yds. On that mark will be found such crack shots as G. S. McAlpin, J. L. Brewer, Dr. Carver, J. A. R. Elliott, R. O. Heikes and Fred Gilbert.

Last year's winner, E. D. Fulford, who was then placed at 29yds., has been put back to 30yds. this year. On the same mark with him are Jack Fanning, of San Francisco, Cal.; C. W. Budd, of Iowa; Simon Glover, of Rochester, N. Y.; Ed Johnson, of Philadelphia; F. S. Parmelee, of Nebraska; R. A. Welch and the veteran Capt. Money.

Last year Mrs. W. P. Shattuck, of Minneapolis, Minn., was the only lady shooter. This year she has for companions Mrs. P. S. Murray, of Stillwater, Minn.; Mrs. M. F. Lindsley (Wanda), of Cincinnati, O.

The list of entries shows that a total of 28 States, as well as the District of Columbia and the Dominion of Canada are represented in the Grand American Handicap this year. There are 122 shooters from the Eastern States, 107 from the West, 34 from the South, 2 from the Pacific Coast, 1 from Washington, D. C., and Thomas Donley, of St. Thomas, Ont., is the sole representative for the Dominion of Canada.

New York State leads the list with 40 entries; New Jersey is close second with 39; Illinois has 31, Pennsylvania 26.

In order of numbers the representation of the rest of the States is as follows: Ohio 18, Iowa 14, Missouri 12, Wisconsin 10, Kentucky 8, Indiana, Maryland, Massachusetts and Minnesota 7

each, Tennessee and Connecticut 6 each, Nebraska, Texas and South Carolina 4 each, Maine 3, California and Michigan 2 each.

Each of the following have one: Georgia, North Carolina, Virginia, Rhode Island, Arkansas, Colorado, Florida, District of Columbia and Canada.

Tuesday, April 12, is the first day of the Interstate Association tournament. On that day there are two events scheduled as follows: Elkwood Park introductory, 7 birds, \$5, birds extra, 30yds. rise, three high guns; Nitro Powder handicap, 15 birds, \$10, birds extra, handicaps in this event will be the same as in the G. A. H. The purse will be divided in "high gun," not class shooting, and the number of moneys will be proportioned to the number of entries in the event. Shooting will commence at 9 o'clock in the morning.

On Wednesday, April 12, the G. A. H. will be started promptly at 9. It will take nearly three days to finish this event, so that in all probability the ownership of the handsome trophy donated by the Interstate Association will not be decided until well on in the afternoon of Friday, April 14.

In view of the probably large number of entries in the Nitro Powder handicap on Tuesday, it has been decided to start with that event and follow with the Elkwood Park introductory, if time permits.

Philadelphia Trap-Shooters' League.

At the annual meeting of the Philadelphia Trap-Shooters' League, held recently, nine gun clubs were present, namely, the Florist, Southwark, Silver Lake, Glenwillow, Roxborough, Delaware River, Forest, Independent and Clearview. The officers chosen for the ensuing year were: President, H. Landis David; Vice-President, William Morison; Secretary, J. K. Starr; Treasurer, A. B. Cartledge; Field Captain, James Cowan.

It was decided that the conditions of the League team match should be with teams of three men each. Each club in the League to enter any number of teams. Each team to shoot at 75 targets, unknown angles, and to have a handicap added to the score. Each team pays \$3 entrance fee.

The tournaments this year will be held under the auspices of the League. In order to complete the series before cold weather sets in seven shoots will be held on the Florists' grounds, at Wissinoming. Tournaments will be held on April 22, June 3, July 4, Aug. 12, Sept. 23, Oct. 21, Nov. 30.

It was decided that there should be an individual membership as well as a club membership, open to all, whether members of League clubs or not. The individual competition will be at 30 targets at each shoot, 15 unknown and 15 known angles; handicap added to the score; entrance fee for the series, \$1.

The team shoot will be governed by a point system, the six best scores of any one team to count; under this rule a team may be absent from one of the seven shoots and not suffer any loss. Each League club may enter any of its members on any one of its teams.

In the individual contest the gun with the six best scores, handicap included, will win first prize. There will be one cash prize for every five entries, high guns.

The handicap for the first shoot will be taken from the percentages of last year, and each succeeding shoot will be handicapped by the previous shoot. Each man receiving an allowance of broken targets, the difference between the number he shot and missed, less 25 per cent. at the previous shoot. This handicap covers both matches.

As the time between the meeting and the first tournament will not give time to call another meeting, it was decided that any regularly organized gun club wishing to join the League may do so by addressing the secretary, J. K. Starr, P. O. Box 295, at any time, or by having a team present on the grounds. The same rule applies to individual members.

Oil City Gun Club.

OIL CITY, Pa., April 6.—*Editor Forest and Stream:* At the annual meeting of the Oil City Gun Club, the following officers were elected for the ensuing year: A. Smedley, President; C. H. Lay, Jr., Vice-President; F. S. Bates, Secretary; H. C. Dorworth, Treasurer. Directors: C. M. Loomis, H. J. Foskett, C. T. McClintock.

The treasurer's statement for the past year showed the club in good shape financially, and the record of shoots showed that the friendly rivalry between the members has been unaffected by any kind of weather. There has been but one Saturday in the year when our weekly shoot was given up, and on that day, with the mercury 15 degrees below zero, we took compassion on the trapper. During the past year the club has shot 47,348 bluebirds, which speaks for itself and shows the healthy condition of the club.

At this meeting the club sold its club house and grounds in the West End Borough to the Oil City Golf Club, deciding to move its traps to the Smithman Park grounds for the summer and hold the interstate tournament of May 17 and 18 on these grounds.

Smithman Park is located about four miles from the Oil City hotels, at the terminus of the Oil City Street Railway Company's lines, and will be well remembered by those who attended the Pennsylvania State shoot in 1897 as an ideal spot to hold a target tournament. The street cars leave the hotels every twenty minutes for the grounds, and the ride of about thirty minutes through the woods, which later in the year abound with grouse and woodcock, prepares a man to shoot his best.

The park has been much improved in the past two years, and when one tires of shooting, a walk through the grounds and a visit to the different springs will be well repaid.

The Oil City Gun Club will extend the same welcome to the shooters who attend the interstate shoot that was given to the participants in the State tournament of 1897, and assures those who anticipate attending that they will never regret the two days recreation and sport.

Have you ever seen a dog with a bone? If you have, you may have noted with what devotion he seeks it, with what care he guards it, with what fervor he holds it, with what prudence he begins on it, with what affection he breaks it, with what diligence he smells it. What induces him to do this? What is his hope? What good is he to get from it? Only a little marrow.

Rabelais.

PEMMICAN FOR THE ARMY.

THE aftermath of the late war with Spain is not altogether pleasing to the patriotic American. There are squabbles in the army, jealousies and backbitings by the friends of eminent naval officers, and above all scandals in connection with the army commissariat, which are not pleasant reading.

Very different was the course of the British invasion of the Soudan from that by the United States as to Cuba, and for very good reasons. The British occupied two years in their preparations for General Kitchener's successful campaign which recently ended, and their experience in India had taught them all that was needful in the way of preparation for handling and feeding troops under the conditions prevailing in the tropical desert. The United States went into the war with Spain on little more than thirty days' notice. It had not had an army in the field for more than thirty years, and it had never had an army in the field in the tropics. Nevertheless, with blundering boldness, and with a faith in itself which is wholly characteristic of us Americans, it sent its troops with a rush to hot and rainy Cuba, and later it paid the penalty.

The suggestion made in our columns by Capt. L. S. Kelly, scout, Indian fighter, explorer and soldier for more than thirty years, is the outcome of his long experience, and well deserves careful consideration by the heads of the army. It is well understood how compact, nutritious and portable a food is pemmican, and if made without grease and protected from dampness, there is no reason why it should not form a most useful army ration, whether in temperate or tropical climes. It would not do to make it with grease in the old-fashioned way if it were to be used in the tropics, and even if dry, it would have to be enveloped in an air-tight covering if it were to be carried in a moist climate, since in wet weather both pemmican and dried meat soon mould and spoil.

Although, in old times, pemmican was usually made from the flesh of the buffalo, any sort of meat will answer for this purpose if it be properly selected and prepared. Moreover, pemmican is extremely palatable, and is a food of which one does not easily tire.

It is altogether likely that the experiences of the war with Spain will bring about important changes in the Quartermaster and Commissary Departments of the United States Army, and we do not doubt that Capt. Kelly's suggestion will receive due consideration.

THE PRAIRIE CHICKEN IN ARKANSAS.

ARKANSAS, in the variety and abundance of its game birds, animals, and waterfowl, possesses a natural wealth unsurpassed in kind by any other State in the Union; indeed, it is probable that, considered all in all, none can equal it. A large area of the State is mountainous, other large areas are prairie, and there is an immensity of forest and cleared land, river bottom and water courses, affording habitat for deer, bear, quail and other game. Had the State been specially designed for a great game preserve, it could not have been by nature more favorably prepared. So much more alluring are the quality and amount of sport which it affords that hunters from Tennessee, Mississippi, Missouri, Texas and other States, which are themselves great game sections, journey to within its borders and hunt its bear, deer, ducks, quail and prairie chickens. An abundant food supply everywhere the year round, combined with a mild climate, insures an easy existence for the game.

Notwithstanding the lesson of destruction and consequent loss taught by the apathy or neglect of different States in the matter of game preservation, no State is more prodigally reckless in squandering its game wealth than is Arkansas, and no State leaves its game interests more unprotected. Its game laws are all largely a dead

letter, for they are seldom enforced; and there is no adequate legal provision for their enforcement. There are no game wardens, and we are informed on good authority that, under the present constitution of Arkansas, which prohibits the creation of any new offices, it would be impossible to appoint a game warden without the necessary amendment to the constitution. Much is therefore left to the zeal of the individual, and however great that may be, it must always prove far less efficient than organized legal action.

No instance of the utter lack of real energetic purpose in the preservation of its game will serve better to illustrate the point than the manner in which Arkansas has permitted the gradual destruction of its prairie chickens. There are three counties, Lonoke, Prairie and Arkansas, which are largely prairie country, and which afford a natural habitat for the prairie chickens which abound therein. In 1893 a law was passed protecting the species closely for five years. The mere passage of the law constituted the sole measure of protection. Its enforcement by any officers was but little if at all attempted. Still, as a law, it had a beneficent effect; for while men might shoot the chickens and did shoot them, they did not dare offer them for sale in the open market. Thus the destruction was checked in so far as the open commercial features of it were concerned.

However, the purpose of the law, the protection of a depleted stock through a period of time which would permit of its desired multiplication, was in a large measure defeated, and thus at the expiration of the five years of close season the attempt resulted in little if any gain.

There were many who insisted, after the five-year law had expired, that there was no close season whatever on chickens within the State's limits, but the Attorney-General decided that the old law was then in force, and that the open season, according to the statute, was from Sept. 1 to Feb. 1—five full months.

With such inadequate protection, supplemented by public apathy in respect to the preservation of the prairie chicken, it is but a question of a longer or shorter time before it will cease to exist in Arkansas. It is deplorable that so valuable a game bird is to be lost for the want of a preventive measure of adequate protection. It is not yet too late, but if we may judge the future protection of the chicken in Arkansas by that of the past, its fate in that State is extinction at a date not remote.

A WARNING.

HOWEVER much may have been written on the destruction caused by the great cold wave of Feb. 13 and 14, 1899, we may feel sure that the half has not been told. The destruction to animal and vegetable life was beyond belief, and extended over almost the whole United States. Naturally, this destruction was greatest in the South. In the northern States, where animal and vegetable life is accustomed to the ordinary winter temperature of its own latitude, there is no great suffering if this temperature falls for a while many degrees below the average mean, but when a touch of the Northern winter visits the sub-tropical South, it means death. All through the Southern States as far as southern Florida, the bitter frost extended, destroying orange groves, banana plantations and pineapple fields, which to-day look sere and yellow, as though a fire had passed over them. Snow lay in the streets of New Orleans, and Louisiana streams were frozen.

The deep snows which prevailed through a large part of the South caused many birds to perish from starvation, while the terrible and unaccustomed cold destroyed still more. It is said that for 200 years no weather so severe has been recorded on the south Atlantic coast. Mr. Arthur T. Wayne, writing in the Auk, paints a pitiful picture of the sufferings and destruction of the birds. He tells us that to say that fox sparrows and snow-birds were frozen to death by the millions is not an exaggerated statement, but a conservative one. During the first day of this cold wave, there appeared a tremendous migration of fox sparrows, which seemed to come from the northeast, migrating in the southwesterly direction. Thousands stopped all day long in Mr. Wayne's yard, and swarmed on the piazzas, about the outbuildings and in every place that would afford protection. They were busy scratching away the snow to find bare ground, the stronger birds singing, while the weaker ones were

freezing to death. Black birds of two sorts killed and ate these birds, while they were so benumbed by the cold that they could not get away, and even the stronger among the fox sparrows fed upon the bodies of their dead kindred. Mr. Wayne captured great numbers of little finches of different sorts and put them in a large cage, which he brought into the house, so that they might keep warm. But all of them died. Most of these birds were fat and in good condition.

Another species which suffered terribly was the woodcock. These arrived from the North in countless thousands, although previous to this but two birds had been seen during the winter. Woodcock were found everywhere, and all were completely bewildered. Many thousands were killed by so-called sportsmen, and thousands more were frozen to death. Most of the birds were greatly emaciated. It is said that one man killed 200 pairs in a few hours. On the second day of the freeze, Mr. Wayne easily caught on the snow several birds so thin and weak that they could scarcely fly. He put them into a thawed spot on the edge of a swift-running stream, where they might move about and get a little food, but on visiting the place the next day he found one frozen to death. It cannot be doubted that more birds perished in this freeze than were killed by gunners during the entire year.

No class of men are likely to suffer more severely—in their pleasures—by this cold wave than do the sportsmen, and unless great efforts are made toward protecting the game birds that have been most largely destroyed it may be questioned whether the stock will ever re-establish itself. Now more than ever there is call for stringent protection, and above all, for the exercise by each man of that measure of self-restraint in his killing, which, after all, ought to be the true test of the sportsman and the gentleman.

DOGS IN CITIES.

HENRY WARD BEECHER once said in a sermon: "There is many a horse that is more deserving of immortality than the man who rides it. There is many a dog that has more disinterested love than the man who owns it. Why shouldn't they have a chance hereafter? I don't know but they will. That is something I don't know anything about." As a matter of fact, we do not any of us know anything about it. But most of us are agreed that if a dog is in misery it should be put out of misery, and if homeless should be sent to its long home. Among the important and admirable activities of the American Society for the Prevention of Cruelty to Animals, in this city, is the humane destruction of dogs and cats, vagrant or disabled beyond recovery. The undertaking of this task by the Society and the efficient way in which the work has been performed mark an actual advance in our civilization.

Formerly, as is well known, the city was scourged with a horde of officially designated dog catchers, sometimes more degraded than the brutes they were set to capture; and the condemned dogs were drowned in the river. Under that system the public was subjected to frequent outrages, while the plague of stray and cur dogs was not sensibly diminished. Under the administration of the Society, on the contrary, the work is done quietly, unostentatiously and practically, indeed, unobserved, and yet effectually and above all humanely. The statistics given by President John P. Haines in his current report, are astonishing. These are the totals of animals destroyed by the Society's agents during the last twelve years: 1887—1,202; 1888—1,281; 1889—705; 1890—1,347; 1891—2,212; 1892—3,060; 1893—4,794; 1894—24,275; 1895—46,898; 1896—73,197; 1897—88,028; 1898—91,535. The tremendous increase shown in the figures for 1894 and succeeding years is accounted for by the fact that in that year the Legislature enacted the law which entrusts to the Society the entire work of disposing of unlicensed dogs and stray dogs and cats. Of this part of the Society's work, President Haines says, and public sentiment will sustain him: "There can be no doubt of the public service to the community which has been rendered by our shelter system, and the painless destruction of these homeless, helpless, neglected, and generally diseased animals, while delivering the human community from a pestilent nuisance has conferred an unspeakable benefit of health and comfort upon the animal population."

The Sportsman Tourist.

Deer Hunting Days in the Adirondacks.

AN October afternoon in '98 found us waiting for the crazy craft to start up the lakes—'twas a twin-screw affair, twin-engines using steam expansively and expensively. The bells called "Go ahead!" There was a cloud of leaking steam, a hipity-click, bump, clatter from the engines and they're off. Like human twins they went evenly for awhile, and then, either from lack of stamina on the part of one or an excess of vigor in the other, they drew apart, and the course changed until the creaking rudder slewed things straight.

With a plethora of wood and water, what need to take an indicator card or worry how valves are set? I explained to my companion the pitiable condition of the steam plant. He merely said: "The bed-bug has no wings to fly, but he gets there just the same." We threw off mail bags, merchandise and ennui, and the boat finally, with its crew and passengers, put up for the night. I met Delmarsh out under the trees where he looked like himself. We talked of the massage treatment he had given me the year before, of the buck that I had shot, of the fun we had in camp, and then I told him that my brother-in-law was with me.

"How did that happen?" said he.

"Why, he married my sister," I replied.

"Oh, no, no; what did you bring him for?"

I told him that it was a matter of gratitude. "He has been kind to our family; he came in at a time when Cupid was about to confer the degree of O. M. Dun and Bradstreet say he is well off. He is sixty-seven years old—of course I don't speculate on either condition, but I am inclined to be very kind to him, although they tell me that he has a will of his own. Come over, B-in-L., I've been telling Archie all about you."

"Don't mind him, Mr. Delmarsh," said B-in-L. "He is light-headed on account of the war, because he had several ancestors in the battle of Lexington and has played marbles and spun tops on Lexington Common, because he has 'hooked jack' from the Concord schools and bathed in the waters at North Bridge, where 'they fired the shot heard round the world'; because he has been a member of the A. & H. Artillery Company and the First Battalion of Cavalry of Boston (these troops discovered thirst), he thinks that by inheritance and environment he is a great military strategist and that the whole burden of the war has been upon him. War correspondents and others have had the same trouble. When the Manila affair came off he wrote poetry, beginning:

We don't forget the Maine,
Do we?

"The papers did not publish it. His wife tells me that on the Fourth of July he loaded all his guns and lambasted the fence and clothesline posts in the backyard, and when the little boys of the neighborhood looked over and cheered him he said: 'Don't cheer boys, the poor devils are dying.' One night he thought himself Col. Roosevelt, and getting up in his sleep he took an old saber, tried to climb up the side of the room and yelled: 'Come on, boys, we'll lick h—l out of them!'

"He had killed the canary and smashed the clock before they got him to bed again. He is worn out and his money all gone in buying papers. So, Archie, I want you to fix him up and pull him down to earth again; if you cannot do it he will be lying at death's door, with no one to pull him through."

"I guess he will lie, anyway," Delmarsh said. "You two men talk all the time. The pack-horses and supplies are ready and my brother consents to go. The trail is very heavy from late rains, and you will both need time and muscle to cover the seven miles of hard tramping, and you will blow differently, soon."

Little did he know how I longed to see that old open camp again, or how pleased I was to see his honest face once more. How soft the flannel shirt. The baggy corduroys that at home would debar me from polite society were now in style, and the old boots hidden from sight for months now sought the forest voluntarily. The rifle fitted its place upon my shoulder, and its breech action whispered in my ear, "Oh, what a snap!"

We leave the road, cross the brook and the trees close in behind us and shut us from the "common people." The pack-horse at my side seemed to remember me and gave me the best path; and when, coming to some steep incline, I reached out for assistance, it was cheerfully given. That B-in-L. of mine, in spite of years, was as tough as a barbed-wire fence; he has tramped New England for nearly fifty years with dog and gun; his old Schaffer 12-bore has brought down many birds, and is so worn that it is several ounces lighter than when made; his wiry form was in advance always, and on a steep climb he looked back and sang:

"Climb up, ye little chilluns,
Climb up, ye older people,
Climb up to de sky.
Now is your chance for heaben,
Go up in six an' seven,
Climb up, ye chillun, climb!"

Down the other side Archie would look back, at me and say: "Slide, Kelly, slide!" Five miles were covered and I was a wreck. Tenderly they lifted me to a saddle, and then I ached in new places. The mountain was so steep that my pipe brushed the ears of the horse in trying to be upright; going down into the valleys I would lean back so far that the cantle of the saddle damaged my kidneys. However, we reached camp in due time and I dismounted by claspng a tree trunk and sliding down like a brown bear. Rozinante and Don Quixote parted.

Say, has any one told you about this camp? If not, I will. Three logs 8ft. long are piled up on three sides, the open side faces a like structure, which is about 8ft. distant, and the openings face each other; the roof is of poles and tarred paper, and slopes back from a man's height in front to the top of the three logs in the rear. Between these two structures is our stone fireplace, and from poles reaching from one roof to the other we suspend

pots and kettles in the culinary processes. This camp is bounded on the north by a huge mountain and a state of wildness, on the east be the coldest and purest spring in the world and a little brook, on the south by the sun, on the west by the happy hunting grounds, wherein abide deer, partridges, squirrels, owls, bluejays and ground hogs. The architecture is Colonial, if anything. Art? Well, there are no mottoes made of perforated cardboard and multi-colored worsteds framed in black walnut and reading, "God bless our home," and yet I believe that sentiment was with us. The literature consisted of what might be found on tobacco packages and baking-powder cans—one advised as to the law and the other in relation to absolute purity. The staple productions of this habitat were venison steak, broiled birds, flapjacks, hilarity and sleep. Its inhabitants at the time of which I write were a boy with a big appetite, an excellent cook and guide, a fine old gentleman-sportsman, and yours truly, done up in bandages and court plaster, and smelling of arnica and a corn-cob pipe.

A satisfying lunch, the sunshine, past exertion and the soothing influence of a pipe well loaded with a mixture of Virginia, Havana, Turkish and perique blended in unison, invited a siesta. The start was propitious—the balsam mattress fitted my graceful curves and day dreams began—barring sex, I was an Alice in Wonderland; relaxing jaws allowed my pipe to drop or turn, and the hot ashes were spilled on my pearly bosom. "Wow! Holy smoke!" The expletives brought in B-in-L. and Archie to my feet. One said, "He's got 'em," the other said, "Snakes!" "Two imps on the footboard," I suggested. B-in-L. removed the bottle of furniture polish and Archie covered my delicate form with a blanket. I was off again, dreaming as follows: There are two kinds of Adirondacks, and few see the real; usually one gets no further than some hotel piazza, and sitting there

CAMP HASTINGS.

adorned in negligee shirt, blazer, golf cap, link buttons and an electro-plated gold watch that sounds like a stock-ticker as you wind it to attract attention—you gaze at your imitation Scotch golf stockings and shapely legs (?) and wonder if your money will hold out for the week; then you seek an introduction to some limpid summer girl, and get it. Then you ask her if cigarettes are offensive to her, and before she can reply you are blowing clouds of smoke through your nostrils, hoping thereby to convince her that you are a man of the world; then you entertain her with your profound familiarity with the writings of Ibsen, Balzac, Tolstoi, Browning, George Eliot and George Sand, and suddenly cease talking, inasmuch as you have doubts as to the sex of the last two. As you lift your cap to leave you hear her tell her mamma in a stage whisper "that Mr. Ballbearings is a most charming gentleman, and such a scholar." You realize that you are not, also that she is out for a husband. A few more days of piazza and parlor life and you are home again admitting that all you have had that you could not get at home is fresh air; then some noon you dash into a "quick lunch" death-trap and bolt a lot of indigestible pastry, and as you pay your check your eyes meet those of the cashier, and you know the voice as she twitters, "It looks like 30 cents."

Oh, come away from such scenes, come miles out into the forest with us, away up on a mountain side to our camp among the balsams; come where high collars and Hamburg edging have no place and are not seen; come where the bluejays and the squirrels guy us, where the owls hoot o' nights as we sleep on the ground, and the pensive skunk spreads a balm impartially over all nature in the wee small hours. Then up at dawn, a cold scrub at the spring, and rustle with us for breakfast. The viscosity of the coffee will shame a chef and the venison steak and flapjacks send rich blood hustling through your veins, and you will go out and kick stumps for exercise. Then "Johnny, get your gun" and take a long tramp among the beeches; go where the spruce gum is not alloyed with rubber, and as you pass a clump of mountain ash some gay cock partridge caroms off into space with a whirl like that of an electric motor. You smile quietly and admit that you were frightened, that you did not have time to shoot, and don't care a rap any way. Anon, you come to some gurgling brook, and as you part the alders and peer down into clear water you see the scurrying trout dart off toward some dark pool; then you lie down and drink deeply of the pure water, and as you regain your feet your eyes glance up to the crest of yonder ridge, and you see the white flag of a fleeing deer shaken at you derisively as it disappears into the valley on the other side.

Wending your way back to camp, you congratulate yourself that you have not destroyed life; you tighten your belt hole by hole to appease a growing hunger and wonder if the process can be continued till you reach

another meal. The pungent odor of burning greenwood and the gray smoke from the camp-fire greet you and a sublime feeling of satisfaction with all things is about you like the halo of a pictured angel. There are no signs, "Keep off the grass," and you doze on the bench in the sunshine with no dread of an unfriendly locust or of a gruff voice saying, "Gwan outer that!" I hear a voice—the spell is over and I wake up feeling as fresh as a drummer on his first trip.

The two guides go one way, B-in-L. and myself another, each party hoping to bring back venison. My companion had such faith in my skill that he deemed it useless to carry a rifle. Quietly we passed through the forest, and creeping up some slope on hands and knees we think to surprise some browsing deer on the other side. Absence without leave is the report. Again I stood where my rifle had done its work a year ago. A hand touched my arm, then pointed across the valley. Standing side toward us was a splendid specimen of a Virginia deer and of gender masculine. With deliberation and assurance the Lyman sights sought the shoulder, and gas pushed lead, and the deer stirred not. The same process again, and the same result; then I went to pieces and was rattled; then four or five more shots rattled in quick succession and the deer loped off unconcerned. Derision was on B-in-L.'s face and I appreciated the sentiment of Cambronne at the Battle of Waterloo, as described by Victor Hugo. As we went back to camp without speaking, I recalled the fact that the original front sight had been replaced by a new one: this was too high and a little to one side; hence all shots had gone low and far to the left. A small error at the sights means yards at a distance. Moral: Test your gun and do your range finding on an inanimate target.

Some time after we had been in camp Delmarsh came down the mountain side in the twilight bearing on his shoulder the limp form of a large doe. This sturdy guide walked easily under a weight more than his own, and as he shook off his burden the firelight disclosed his look of pride, and I envied him not. I essayed to cut wood for the night fire, while the others retired to a safe distance. Delmarsh called me Washington, Gladstone and a kindling-wood factory. B-in-L. whistled "There will be a hot time in the old town to-night." The product warmed me more in the cutting than in the burning. We were awakened at midnight by snow blowing in upon us from the windward side. Opposite, the fierce heat of burning logs melted the crystals ere they touched the earth, and a brown streak extended away from the fire like a running coffee stain below a diamond stud on a white shirt bosom. Soon the huge back log, burnt in twain, fell into the coals below, then ten thousand bright sparks went zig-zagging heavenward to meet as many descending snowflakes in a clench of mutual extermination, and tiny specks of a smutty water descended toward the fire, to be in turn destroyed. I began to recite a prize essay upon the wonderful workings of nature and was telling Archie how nothing was lost—"Except sleep," said he, interrupting me. Then the sleeping bag of the old man moved, and from its depths came a grim voice, saying, "And from out the mouths of babes and sucklings shall come forth words of wisdom." I could not keep awake with an unappreciative audience, and slept and snored to such an extent that B-in-L. said that if my sister had the same ability he would get a divorce. I dreamed that I was home again and snow-balling with a band of Palmer Cox's brownies on the roof; then my wife came up to ask for 50 cents to pay for cleaning off the sidewalk, and I told her to take it from the foreign mission fund that she had charge of.

Before daylight I was aroused by the click of cartridges as they were pressed into the magazine of a rifle. "Hush my babe, lie still and slumber," was the advice of B-in-L. He had appointed me cook for that morning, and I was to remain in camp while they went hunting. I thought to scatter balsam boughs around the fire to cover the mud; thought the spot might resemble an open hearth in a green room. The first stroke of the axe on the tree brought a bushel of snow down upon me; the first splotch knocked my cap off; the rest slid from my bald head down around my neck.

As a servant I did my best. I warmed over some hard-boiled eggs, put a can of baked beans to soak, cut bread and my thumb, made beautiful imprints on blocks of butter with the hob-nailed heel of a boot, listened for the milk wagon and got the wash on the line before the folks came down to breakfast. After the meal we had a three-cornered game of coin comparison, and before I really understood it they had absorbed all of my specie. Disgusted with sixteen to one odds, I decided to still-hunt alone. It was snowing and blowing, but the old man said that "the Lord tempers the wind to the shorn lamb."

Navigation was open, and in an hour's time I was in the wildest part of the State. Snow had become slush under foot and rain over head. The new process, bel-lows tongue, lap-welded and patented hunting boots had become pumps—not dancing pumps, except when I slipped, but real suckers, and a stream of water, with an occasional bit of woolen stocking, was flowing over the tops. Snow water will penetrate harveyized armor-plate. Wild, did I say? Just look about with me. Huge mountains on all sides, seen at times through the openings, are patched with evergreen trees, with the frost-bleached beeches, maples and oaks, and barren rocks, now white in part with snow. Immense birds, hawks or eagles, sail overhead ready to drop like shots upon their prey; in the low depths adjacent to us lie the flotsam and jetsam of forest wreckage; all around are rotting tree trunks, upturned roots, dense barricades of tangled brush and vines, small distorted saplings struggling for the light, waving green brakes side by side with the unburied dead of their own kind; bronze, gray and green mosses clinging to rocks, trees and brook banks. Uncouth excrescences like huge warts blemish the body and limbs of the woodland chiefs.

The brook is fed by the filtered and yellow essence of dead leaves and rotting mould. A huge tree, felled athwart the stream in some past storm, has its branches driven like piles into the channel; then branches, twigs and leaves from up-stream lodge against them. The water deepens, the soft banks, saturated and heavy, slough off; a new course is found, and the trout down stream

hide beneath the stones till the clouds roll by. Sunbeams never dance in this hollow; dank vapors arise; dark in daylight, it is a dungeon at night, a fit home for bats, vampires and will-o'-the-wisps. I leave you there until after nightfall, and the banshees and goblins will get you if you "don't" watch out."

I am over in the valley of the burnt plains now, standing backed up to a charred trunk of a forest fire victim. The rain freezes as it falls, and the briars, twigs and dead grass are coated with ice. When lost in some remote nook of the Creators' domain, one is apt to wonder if others have stood there before him; what human shapes have gone up this valley in years past. Is it not probable that the Cardiff giant, as long ago as the stone age, played a Jew's-harp on yonder rock in the days of his adolescence, and as old age came upon him, did he not drift toward the town named in his honor, and there, lying down to sleep, rigor mortis came over him and held him bound till discovered by enterprising showmen.

In the moonlight some busy bank president has most likely skipped over this brook and dashed up yonder runway. With his coat tails frayed, with his silk hat soiled by the owls, with his dress suit case bearing his name "Guy S. Kumon," and bulging with bills of exchange on the Bank of Montreal, he hurries on, and stopping only to blaze the hemlocks with an ink eraser in a desire to help others, he reaches his goal. Later on the Adirondack Railroad covers the beaten track and quicker time is made. Some hobo, kicked out from "pent-up Utica," may have tickled the snout of a sleeping bear with a sprig of golden rod in lieu of some better method of working the growler.

I was cold, wet, and wondering if a sportsman's life is always a happy one. Harlem! Hoboken! Hades! there's a buck walking yonder hillside! Rifle makers think they know it all, and yet as I carefully threw in a shell the action clattered like a load of scrap iron. The deer quickly hears the noise and as quickly bounds away. His speed is no match for that of the bullet sent after him. The flag goes down; I see him stumble, gather and run on; then began a race with two entries. A wounded deer seldom crosses a stream if other channels of escape are open, so I hoped to meet him at the base of the hill. Legs that had been softening in the shade of a roll-top desk were ill-fitted to carry surplus weight on this track, yet I had past evidence that I was a good mud horse. The result was a dead heat for the buck and blind staggers for myself. My lungs were bursting—limp and used up, I collapsed in the snow. I knew where the second bullet struck, and that the stakes were mine; yet I was in no condition to receive them. I wished Archie would come, and never felt the need of a telephone so badly. All I could do was to grasp a suspender buckle and "hold the wire." After resting awhile, the knife did its work, and by bending down a sapling I trussed up the meat and started for camp. The faithful guide was worried at my long absence and had started out to find me. We met a mile from the camp. I asked him if B.-in-L. was worried also. "No," he said. It seems that B.-in-L. had told him that "when Fatty gets tired he will go to sleep and you can find him by his snoring." When we reached camp we found another deer hanging there. "Who shot that?" I asked. "I did," said B.-in-L.; "you are not the only flea on the dog."

That night B.-in-L. awoke us by his restlessness, and we found his arms moving up and down and his jaws snapping convulsively. "What's the matter with you, uncle?" When he came to he said: "I was dreaming, I guess; I thought Archie had made a flapjack as large as a cart-wheel and had placed me in the center along with the butter and maple syrup, and I was trying to eat my way out." Well, we placed hot cloths on the old gentleman's stomach, and then he rested quietly.

Insomuch as all were tired from the hard day's work, we slept late and had a late breakfast. You should see the young guide, Eri, eat. Boy-like, he leaned forward, and placing a loaded knife and fork in his mouth at the same time, he would slide full dishes in a place of ready access and discard empty ones with his elbows. At the same time his eyes would watch his brother as he prepared more food. In spite of his feeding qualities, he was so thin above the hips that most any bargain counter shirt waist would fit him. He needed no dyspepsia tablets, pepsin, or bitters—just a chance to eat, grow, work and sleep. No mud was too deep for him, no hill too steep, no task or errand too tiresome. He made our comfort and pleasure a deep study, and when, on the day he shot his deer, he wished us to take it home and give it to the needy, he showed his kindly disposition.

If you read these lines, Eri, don't get angry with me for the first part. It is only my way of getting square with you for the sly things you said to the others about my shape.

We went after my deer and brought him in swinging from a pole and carried upon our shoulders. It was a most tiresome piece of work, yet the reward was in the burden. Heavier deer have been shot, but none more handsome. A splendid head, evenly grown and well poised antlers, black and white striped hoofs, rich brown and gray coating—a fine scion of the First Families of Virginia, than which none more proud have roamed the leafy woods. Then and there I decided that I would never shoot another deer. Why? I have shot three in my time; I have found that I can do it; and I have preserved two heads as trophies. I had rather see them alive and the species perpetuated than others may, in the future, feel the joy of meeting them in the stillness of an autumn day, and I ask of the law-makers now, and in the future, "Please don't let the dogs chase them." The modern rifle gives any man a sufficient advantage, and no one should be unwilling to depend upon such advantage as sufficient. Give the deer a chance and do your hunting yourself. Why let out the job to dogs and sit like a chump back of some hotel or in a boat, ready to blow the poor brute's head off with a shotgun as he is driven to you, and helpless to escape? Get out into the woods like a man, sleep under the trees where the deer sleep, move when they move, have the courage of Spartacus, who met upon the arena every shape of man or beast that the empire of Rome could furnish, and never lowered his arm. Kill your own game; it tastes better. Don't hire the bravos to do your killing, as the Doges of Venice did in the olden times. Don't kill more than

you and yours need to eat; rather spend your surplus time studying the habits of your best friends, i. e., the game you seek. Don't kill at times when the deer are about to multiply. The game of the country is like the few dollars you may have accumulated; don't spend it all in one grand round of pleasure. Draw a little at a time and allow the remainder to gather more and do what you can to increase the store. Don't call a man a "game hog;" it has no argumentative force. Plead with him; show him by example, teach him by precept and axiom that he is dead wrong; instruct him kindly in order that the days of the game can be long in the land.

In the picture of the camp you see the guides, the deer, the smoke of the camp-fire, the airing blankets and the aged bird dog, hardly distinguishable from the snow spots. He was with us more as a guest and old friend than as an assistant. In the winter of his life he is cared for by friends; ere long he will make his last point, and if he could talk he would say: "When I die cover me with mossy sods and autumn leaves, where the grouse and quail hide; near the shores where the woodcock and jacksnipe sport; and if you pass in future days, think of old Rex, the faithful."

On the morning of the seventh day we were breaking camp and hoping to reach the settlements without breaking our necks. My pack basket was on and B.-in-L. was fixing my buckles in front. Eri was holding one of the four horses by the bit and Archie came toward them with a deer, and when he was about to transfer the burden to the saddle the stern of the frightened horse swung around and bumped me in the back. I butted that dear brother-in-law in the bosom and bowled him over and then slid over his head (by "right of eminent domain") with pack basket askew and tin plates rattling. He was up first, and by skillful manipulation of an extremity he smote me where twin patches are seen on a messenger boy's uniform; then he took a piece of chalk and wrote on the tarred paper side of our sleeping room this passage from Byron (not Bryan):

"While stands the Coliseum, Rome shall stand;
When falls the Coliseum, Rome shall fall;
And when Rome falls—the world."

We were all down at the same time—the deer had fallen, the horse stumbled over a log, and the guides were rolling in the snow and leaves with laughter. After much exertion and care in dodging the kicks of the plunging horses, the three deer are on and we are off, leaving the camp to the winter storms.

As I ride through the swamps and over the mountains the mud flies up from below and the snow pelts me from above when the horse stumbles against the trees or reaches out to eat the leaves. When suddenly he throws down his head to grab at the green brakes I pitch forward on his neck and the basket bangs my head and the rifles do the same for my shins; my trousers legs depart and draw upward from the boot-tops and I am a bare-kneed Highlander—"The Campbells are coming"—and the pibroch peals throughout the startled glen from the throats of frightened crows.

After three hours from the start I am leading the van on the hard road at the lake shore near our journey's end. The guides yell from the rear: "Turn out, Shafter! Make way!" For what, I wonder? Oh, I see. Coming toward us, with nodding ostrich plumes and neck bedecked with Alaska sable (dyed skunk skin), and with glove-fitting, tailor-made suit, is a young woman, "and of her gentle sex the seeming paragon, to whom the kindly stars and better elements have given a form so fair that like the air 'tis less of earth than heaven." I larruped the horse to make him sit up on the roadside wall that the vision might have the right of way. As often happens with a clumsy saddle horse, the attempt to move his head away only brought the other end around. With black eyes snapping and white teeth gleaming, a thrilling symphony of girlish fright escaped from her ruby lips; then there was a beautiful display of leather, lithe limbs and lingerie as she skipped to a safer place. Then I heard old Beau Brummel, B.-in-L., apologizing and saying something about "Beauty and the Beast." She said I was showing off, but as I remember the scene I think she had done her share.

The next day we reached our homes, and my black field spaniel Dusky greeted me as only he knows how. My family seemed glad when I went away and pleased at my return.

Now, Mr. Editor, if you will meet us in the north woods next October.

We will hoist a banner to FOREST AND STREAM,
And another to Rod and Gun;
And there we'll hear the eagles scream
Their greetings to the sun.

W. W. HASTINGS.

NEW YORK CITY.

On Kansas Prairies.—IV.

TAMPA, Kan., April 8.—*Editor Forest and Stream:* Another storm has swept our blizzardy Kansas, so I am again for the day idle. Perhaps the sight of the muskrat house pictured in one of your late editions has something to do with it; but as I sit here in camp in the midst of these great waterless prairies I am harking back to-day to the old-time days on the Connecticut River and its submerged meadows, and I can almost hear the booming of the guns, here on shore, there far out on the water, as one by one the little muskrat gives up the pelt that adds so much at this time the year to the pocket money of the farmer boy fortunate enough to grow up near that beautiful stream. And I thought I might write something of possible interest to some of your younger readers. The older ones will here have to take the back seats, for to them it would mean rheumatism, neuralgia and other of the ills that the passing years bring.

It is of a line of sport very dear to me in the days that are gone. One glad, happy day I came into possession of a single-barrel muzzle-loader, and from that time the evenings of late fall and early spring became very precious, for it was then I liked to hunt the muskrat. Just after sunset he leaves his burrow for his night-

ly wanderings. Purlind and comparatively helpless in the daytime, when drowned out by the spring ireshets, in the night he is keen eyed and watchful as an owl, and as the owls and minks are among his worst enemies, he is alert and under water at the least sign of danger. Supper and "chores" done, after the manner of those days, I would sling over one shoulder my powder flask and over the other my shot pouch, filled with B. B. shot, put in my most convenient pocket some loose caps, and for wadding an old newspaper or perhaps a part of a hornets' nest, or, what I liked still better, some lead foil paper, and then make quick time for the river. Lying down near some place I knew my game frequented, the waiting would begin.

Gradually the twilight would fade away, the bluffs at Pecowsic would loom up, the lights of the city across the river would shine out, overhead the stars would appear, and out of the darkness would come the whirr of the wings of the wildfowl, the cry of the plover or the harsh "quack" of the night heron, and the fascination of the gloaming would be on me; but as time wore on, often the blood would begin to chill with the cold and the thoughts turn to the bright fireside at home. Then on the water would appear a ripple shaped like a letter V; at the point of the ripple would be a black object about half as big as my fist, moving as fast as four active feet could propel it; and straightway at sight of this, fireside, cold and gloaming would all be forgotten, the nerves would tingle, the muscles grow tense, and with a quick glance along the side of the gun—it would be too dark for sighting otherwise—the shot would ring out, and perhaps a little limp body would be floating on the water, or with quick circlings and short divings vainly trying to escape, or perhaps, unharmed, be heard diving away down stream from where I had shot at him. Then would be heard the sound of the ramrod driving the wadding to its place, the click of the lock as the cap was placed on the tube, and the waiting was again begun.

As the measures on both shot pouch and powder flask in the darkness and in hands trembling with cold and excitement often proved treacherous, I sometimes tried to make cartridges by wrapping the powder in paper and sewing the shot up in cloth; but this was never a success. As I look back now I almost wonder that the shades of some staid Morgan or Pynchon did not appear and rebuke me for disturbing the rest of quiet-loving people, for the booming of that old gun has been heard as late as 11 o'clock at night, ringing back from the bluffs at Pecowsic, echoing back from the tall buildings along Water street of the goody city of Springfield, from the walls of the railroad round-house in West Springfield, and all along the little hills on the Agawam side of the river.

I have shot by the light of the moon as the V-shaped ripple crossed the silvery streak; by the light of the stars, and one dark night by the glare of a locomotive headlight shining on the river as the train swung around the curve at Pecowsic. And then, what room for adventure, for I have often plunged into ice-cold water almost up to my waist after some kicking, struggling victim; have waded the mud and slush of the freshet to get to some favorite place; have floated silent and alone on the waters of the Connecticut; in one instance sat for hours on a cake of ice so small that it was rocked by the waves like a cradle, and, loosened by the rising waters; it was held in place only by a few willow twigs, frozen in as it had formed.

I wish there were some way to get at the number of these creatures shot and trapped along the Connecticut and its tributaries, for the total must be simply enormous. One of my acquaintances, shooting with a rifle only, secured enough one spring to bring him in \$17. Another shot in one day on the meadows opposite the city of Springfield twenty-four of the little fur bearers; and these instances might be multiplied indefinitely.

Twice I have known the muskrat deliberately and unprompted to attack human beings, both times in the spring when they are wandering from the river back to their summer quarters. Their habits are very interesting to one who loves the study of such things. They leave the meadows almost at one time, following up the little brooks to the small ponds, where they rear their young. Then in the fall they find their way back to the meadows, and as winter approaches build their houses. I have found these in secluded places as large as 3 ft. high and from 4 to 5 ft. across, and finished off very handsomely on the outside; but usually the muskrat lodge is only a rough-looking hummock rising 1 or 2 ft. above the ice. Through the winter they mostly feed below the surface of the ice and snow; but if the winter is cold and dry the water gets low and they are driven out on to the bare meadows to obtain food. Such a time is a red-letter day to the boy who finds it out, for they are then almost helpless.

One peculiarity of the muskrat is its extreme sensitiveness to the changes of the weather. Sometimes, in mid-winter, I would cut through the ice and set my traps in their runways. So long as the wind held north or west the traps would need but little attention; but let the south wind blow ever so softly and the muskrats would be on the move, and my traps would either be sprung or so covered with mud that the rats could pass over them without danger of being caught. Surely they must have felt the change even through the ice and snow of a New England winter.

Yesterday morning, April 7, I heard for the first time the booming call of the prairie chicken. Saturday last, April 1, I heard the notes of the sandhill crane. The ducks and geese seem mostly to have gone northward, but it has been in numbers goodly to look upon.

I notice that the proprietors of the Blue Mountain Game Preserve are complaining of the small increase of their small game. I can say from observation here they will have no increase so long as they keep the wild boars. Hogs are not wild here, but they run loose a great deal, and destroy everything of the kind wherever they go. The average hog has as good a nose for birds as the best bird dog, and uses it to find the nests and young birds.

PINE TREE.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

A Week's Camp and Quail Hunt in North Carolina.

Editor *Forest and Stream*:

Thinking it would interest some of the readers of your valuable paper, I thought I would tell them of a camp and quail hunt that myself and several other members of our gun club enjoyed during last Christmas week. Our party consisted of T. S. McDermann, M. F. Parham, C. C. Cooper, J. B. Marriott, W. H. Edwards, Master William Williford, myself and our cook, Jim. As to dogs, we were well supplied with some very fine ones, McDermann having two setters, Parham one, Marriott two and myself two setters and two pointers, and some of them as fine as ever wagged a tail.

Bright and early Monday morning, Dec. 26, we loaded our wagons with camping outfit—tents, stoves, cots, camp stools, cooking utensils, and in fact, everything that could be needed for a pleasant and comfortable camp—and headed our teams toward the happy hunting grounds, up in Nash county, on Swift Creek, about twenty miles away.

Both men and dogs were full of enthusiasm and anticipation of the happy time coming.

The dogs were running, jumping, barking and frisking over the fields in the most happy manner. Some of the boys pulled out the old long bugle, and blew ear-splitting blasts that could be heard for miles and miles on the light frosty air. Oh! what a time. Dear reader, if you are a sportsman, I know, that even now, you can feel some of the glad anticipation that was ours on that happy morning.

The roads were in a fair condition, and our journey was very pleasant, and while we did not do any regular hunting, we succeeded in bagging about twenty birds that were found along the roadside, the dogs doing excellent work.

We arrived at our destination about 4 o'clock with everything accounted for except that poor old McD. had succeeded in losing his overcoat, gloves and rubber boots.

We located a place to pitch our tents on a beautiful hill near the creek; then all went to work with a will to make camp, and we succeeded in getting things fairly well fixed by dark.

The next thing in order being supper, a steaming pot of hot coffee was soon made, and all gathered around the "festive board." There were cold ham and eggs, baked turkey and possum, bread, butter, etc. But my! didn't those boys eat. It would have made a hungry wolf shed tears of grief to have seen them.

Supper over, we gathered around a cheerful log fire to tell yarns of exploits that were past and those still to come. Before we had been sitting long, up walked our old friend, W. M. York, who owns a large and magnificent farm near by, and who is as fond of sport as any of us. We had a good old-fashioned handshake all around and a hearty welcome from friend York, whose heart is in the right place, and who will ever have a warm spot in the hearts of each and all of us.

A very amusing incident occurred during the evening. Some of the negroes in the neighborhood, hearing the melodious notes from the old camp bugle, came down to see what was up. They stood around the fire for some time without saying anything, but curiosity soon got the best of one of them, and he asked: "Say, boss, what am dis for?"

Some of the boys told him that it was a show, to which he replied: "Sho thing. I'se glad you come. What hab you got to sho?"

We told him that we had a very fierce man-eating bear, but he had gotten away from us about an hour before, but was around close by in the woods, and we would secure him in the morning.

"For de Lawd, boss, how is I goin' to git home wid dot b'ar lose in dese woods?"

I replied that there was only one way, and that was to outrun the bear, as he would surely be killed if caught. In the meantime McD. had quietly gone up the hill in the woods, and was growling and snarling at a terrible rate. You just ought to have seen that negro's eyes. They looked as large and as white as saucers, and all he said was: "Good Lawd, I'se gone."

And go he did. We never saw such running nor heard such a fuss as that negro kept up in my life. He went and he stayed too, for that was the last seen of him during our camp there.

About an hour afterward another lank-sided colored gentleman walked up, dressed and bedecked in his best clothes and finery. After standing awhile, he asked: "Say, boss, does you took pictures here?"

"Why certainly," I replied. "That is our business. We will open up to-morrow morning, and will make everybody's picture free of cost for the first day. So come down and bring your girl, and tell everybody in the community about it." He seemed pretty well pleased, and soon left us, but I don't think he slept any that night, for early next morning the darkies came in from all directions, and we had to explain to them that our camera had got broken and it would take us a week to get a new one.

We left our cook, Jim, to keep camp while we were out shooting, and he reported that they continued to come all during the day, but he would send them off with some kind of an excuse. I don't think we will try the picture racket again in that section.

It was now getting bedtime, and we decided to make plans for our shooting next day. Three of our party—Cooper, Edwards and Marriott—did not come along with us, but were to join us on to-morrow, so there were only four for Tuesday's shooting. Friend York said he would take two with him, and it being so arranged, we bid our friend good night, "turned in," and slept the "sleep of the just."

When the first bright streaks of dawn appeared in the East, all was astir in camp. Everybody was getting ready his gun, shells, and hunting clothes. It was arranged that McD. and Parham should go with Mr. York, and they were soon off. That left Master William and me to shift for ourselves, and as there were some necessary arrangements to make for our comfort in camp, we decided to do this before we left.

Getting through about 11 o'clock, we shouldered our guns and were off, taking my four dogs—Prince, Rover,

Don and Joe. The first three named were "tried and true," and as good as the best, but old Joe was an unknown quantity to me, and here I must tell how I had come into possession of him.

About two weeks before I was walking up the street with a friend, when we met a hungry looking negro with a string in his hand, and at the other end of the string was tied a long, lean, lank-sided "yaller dog." I saw at once it was a pointer, but by those not up in "dogology" it would be taken for a hound.

"Hello, Colonel," says I, "do you want to see that dog?" Now when I want to please a negro, I always call him Colonel.

"Yas, sar, dat's what I fotched him fur," replied the negro.

"Well, what is he good for?" I asked him.

"Well, boss, lemme tell you 'bout dat dog. I buyed him fur er coon dog, but I ain't kotchted narry a coon wid him yit, an' I don't s'pect dat dog am got much 'quaintance wid er coon no how. Yas, sar, an' dat ain't all, he won't even regunnize a coon when he meet him in de woods. So, sar, I com' to de concludement dat I sell him. an' I fotched him 'long."

"Will he set birds?" I next asked him.

"Well, now, boss, I don't know so much 'bout dat, but I tell you what he do dis morning: I was comin' 'long in de old field, when dat dog, sar, just stop right still an' hold his nose right straight, and hold his tail right straight, an' dar he was, sar, just like dat, and I swar to goodness I thought dat dog done run mad. But fust think I knowed up jumped de bigges' gang of pattiges you ever see. Now, sar, if you calls dat sottin' birds, he sho' will sot dem."

"Well, what is your price on him?" I asked.

"I axes two dollars fur him, sar, an' he am wuth dat to make sausers out of."

I handed him the money and took charge of the dog, but don't think I will try any dog sausage yet.

We started out taking all four dogs, but I was a little doubtful of Joe, and kept my eyes on him pretty close.

BETWEEN SEASONS.

But I never saw a dog cover a field more prettily in my life. He just took it all in.

We had not gone far when little William yelled: "Look, Mr. Harris, just look at old Joe." I looked, and there he was as "stiff as a poker." The other dogs backing nicely. We lined up for our first shot, but I cautioned William to be particular and to take pains, and be careful. When we walked up a very large covey flushed, and bang, bang, bang, went our guns. I dropped two and William scored one, which were retrieved nicely by Prince and Rover. We bagged our birds and went for them again, but it would take too much space to give a detailed account of that evening's sport. We found birds plentiful and did some good shooting.

We arrived in camp, just before night, and found the other party just getting in with a bag of forty-one, while William and myself counted out thirty-four, making seventy-five for the day. In the meantime our three lagging comrades had arrived and were gladly welcomed. Jim had prepared a sumptuous supper, and after this we all gathered around the cheerful camp-fire and enjoyed a good smoke with pipes and cigars, which is always a solace to the weary hunter.

Don't you wish you could have been there, brother sportsmen?

After a good night's rest every one was up bright and early, eager to get at it again. Breakfast over, we divided up in twos, each party going in different directions. I had for a partner that day Mr. Edwards, a good companion but a poor shot.

We did not find birds so plentiful, but succeeded in bagging thirty-six, and to my great joy, I managed to get in shooting distance of a very fine old turkey gobbler, which I neatly downed with my right barrel, and poured the contents of my left into him "just for keeps." He weighed 20 lbs., and was a beauty, but I estimated him at 500 before I landed him at camp.

Upon counting up all bags that day, we found over 150 quail, one turkey and lots of hares and squirrels.

A nice day's sport, don't you think so?

We invited several gentlemen, who lived in that community, down to camp that night, to help us devour a barrel of fine oysters which we had carried up for the occasion, and you may be sure it was a jolly and enjoyable occasion.

The next day Parham was sick, and could not go out with us, but the others had a fine day's sport, and made a good bag. York and Marriott each killed a fine turkey.

Another evening around the camp-fire, and all were ready for bed; but one of the boys—it won't do to call

names—ate so much supper that he had a "night mare," and came very near running into the creek before he could be caught. But he was all O. K. next morning.

Cooper and McD. went off possum hunting that night, but they did not bring any game back.

Friday was our last day, and the boys did not do any hard work, but managed to bag nearly a hundred birds.

As usual, we had a pleasant time around the camp-fire that night. But I believe every man was sad at the thought that early next morning we were to break camp and leave that happy hunting ground. But, alas! all things must end, and accordingly early Saturday morning stakes were pulled, tents downed, wagons packed and all was in readiness to start for home, when I pulled out my old pet—the long bugle—and blew one long and cheerful farewell blast, that echoed and re-echoed across the hills and dales of those beautiful hunting grounds.

I shall never forget this trip. It was both enjoyable and successful, having bagged 325 quail, three turkeys and scores of hares and squirrels.

If any of our brother sportsmen in the North care to come down to Dixie and join us in our next Christmas camp and hunt, we will give them a hearty welcome and a good time.

C. H. HARRIS.
ROCKY MOUNT, N. C.

On Papskanee Creek.

ALBANY, N. Y.—*Editor Forest and Stream*: About the 8th of the present month there was a great flight of ducks here, a large proportion of which harbored about the neighborhood of Papskanee (as it is spelled on an old country map) island. There has been a pretty steady freshet in the Hudson for a long time, and the ducks were using on the lowlands and bogs east of the island. One day last week two of our local gunners, Harry H. Valentine and Mike O'Donnell, went in the former's duck boat to get a crack at the wildfowl as they came on the flats at night to feed. Two live decoys and a dozen wooden ones were important auxiliaries for the sport, but alas (don't say "chestnut"), the birds had nearly all "lit out" the previous Saturday and only an old blackey and a woodduck fell to Harry's repeater. A pair of splendid blue herons were flushed out of a marsh, one of which, the female, fell to Mike's Francotte, but its mate, though fairly hit with a couple of charges of No. 4 from Harry's Winchester, managed to get away. The loss of the bird was greatly regretted, as it was a "plumed knight," and would have gone to the taxidermist's where Madame Heron is now awaiting a sort of resurrection into a semblance of life. Had the boys gotten to the marsh the week before they would have secured a big bag of ducks, as Harry is an experienced duck and both are crack shots.

I often wonder if that dear old boy, Col. Fred Mather, knows how Papskanee Creek looks to-day. I, myself, can remember when it was navigable by skiffs its entire length, barring a carry where the railroad cut the stream in twain, but now it is only when a river freshet is on that a boat can get in it, and when the water level is normal the creek is a long and gruesome ditch. On either side of the embankment where the railroad crosses it the bed of the stream is filled for a long distance with a deposit of ooze, a rank growth of weeds and aquatic grasses, garnished, like some hideous salad, with masses of vegetable slime. On the longer reaches of the creek occasional open spaces are met with and one of these, at Staats's Crossing, is still fishable for "little fellers," but "the green mantle of the standing pool" is in evidence everywhere, and the ill-smelling vapors that are exhaled therefrom are glorified at times by the sunlight with almost prismatic colors.

By the way, I have known this stream ever since I was a "kid" (good while ago, that), but I never heard it called Papskanee by any of the gunners and fishers I have known. Many of my friends have fished the stream and have hunted the bogs and lowlands for snipe and duck from the Greenbush swamp to Castleton, but to all these worthies it has been, and is still, known as the "Ded crik." May I be permitted in these notes to express the hope that Col. Mather may for many years to come grace the pages of *FOREST AND STREAM* with his interesting recitals. Especially interesting are they to one who has been familiar with some localities he has mentioned; who has known a few of the "men he has fished with," and who, like himself, long since passed the noonday of life.

HORACE B. DERBY.

Quebec's Attractions.

NEW YORK, April 14.—*Editor Forest and Stream*: During the Sportsmen's Show in March I had an opportunity to learn how little the Province of Quebec was known to the American sportsman, though situated as it is only within a few hours' travel from this great metropolis. The exhibits from the Province of Quebec fully demonstrated to the sportsman and angler the game and fishing that is to be had in that section of the country, and unlike the State of Maine, may I venture to say, is still unknown to the gunner. I therefore think that it would be a good move on the part of my Government to appoint an advertising agent in all the principal cities of these United States to advertise the country and give the necessary information regarding the hunting and fishing territory, and also to promote a tourist travel which would in my opinion increase the revenue of the Province and make our American cousins more familiar with Quebec.

H. F. TUZO.

Between Seasons.

WHITING, Feb. 24.—*Editor Forest and Stream*: I inclose a photograph of my two dogs, Gid and Duke, two sports between seasons. These dogs never flush a bird and know where all coveys are within two miles of their homes. They also enjoy going fishing almost as much as going out for birds.

This picture was taken by myself, an amateur, and as I have never seen any of this style of picture in your paper I thought to send it.

W. L. L.

The *FOREST AND STREAM* is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Pemmican as an Army Ration.

THE value of pemmican as a food ration is not by any means confined to excursions where means of transportation are limited. Its value has been demonstrated many times on the frontier where fresh meat was abundant and easily obtained.

My attention was first called to it in 1868 while encamped with some Red River people north of Mouse River in the British Northwest. These people were in the habit of going out to the buffalo range every spring from the Fort Garry settlements and putting up tons of pemmican for the winter trade, and to supply the northern trading posts. The mode of making it was as follows: Buffalo meat was sliced with a knife in huge slabs about an inch or less in thickness, and suspended over frames for drying in the sun. A small fire was built underneath to keep off flies until a thin glaze was formed on the outside of the dried flesh, which effectually protected it from attacks of flies. When thoroughly dried the meat would have shrunk to less than one-third of its former thickness. Then it was roasted slightly to make it brittle, when it was pounded with flails and reduced to fine particles. The whole was poured into rawhide sacks and incorporated with melted marrow fat.

When cooled the sacks were stored away in a dry place and would keep for years. This was the crude process used for the trade, there being several grades of this pemmican.

The value of well-made pemmican lies in the fact that it contains the maximum of nutrition with the minimum of weight and space, added to its keeping qualities. It is always palatable whether eaten in the raw state or cooked. While in the interior of Alaska with Captain Glenn's exploring expedition, in July, 1898, I had occasion to dry a quantity of mountain sheep meat to keep it from spoiling. When it was perfectly dry, I roasted it slightly on some coals at the camp-fire, and afterward pounded it in a canvas sack. In this state it was delicious. It served many a time for refreshment on the trail, even when fresh meat was obtainable. Once a handful of it mixed with boiled rice served a treat for twelve hungry men.

Its excellence as a food ration for soldiers on the march cannot be disputed. Soldiers in camp can take perishable meat, and by drying and pounding it in the method described have most acceptable sustenance in small bulk, lasting many days.

I have never known it to cause bowel disorders or other complaints, such as are sometimes induced by a sudden change to a fresh meat diet.

As an economical food ration, I regard pemmican as of great value. An authority states that it "was introduced into the British navy victualing yards in order to supply the arctic expeditions with an easily preserved food containing the largest amount of nutriment in the smallest space." For arctic regions I would add sugar to pemmican, as I found by actual trial it was very agreeable. Sugar in my estimation is equal to chocolate in sustaining power, and the desire for it in Alaska is something that impresses the traveler very quickly.

LUTHER S. KELLY, late Captain, U. S. V.

Natural History.

The Wild Pigeon in Iowa.

SOME thirty years ago, when I resided near Rockford, in northern Iowa, the wild pigeon was exceedingly abundant at certain seasons of the year. During their migrations from the South to the North, especially, they were often seen in this region in immense flocks.

This interesting bird did not, however, stop for any length of time with us, and it was the exception rather than the rule to see a few individuals which remained during the season to rear their young.

During the times of the flight of these birds over this region, many were shot; yet not in sufficient numbers to make any perceptible diminution in their numbers. During certain years scarcely any of these birds would be observed in this portion of the State, while at other times they would, as stated, appear in great numbers.

Why this only periodical appearance I am at present unable to state with certainty. At that early day this species occurred in vast numbers to the north and northeast of us in Minnesota, Wisconsin and Michigan. Their line of migratory flight over this portion of northern Iowa appeared to be an exceptional one.

The few individuals which remained with us to breed were always wild and shy, and for the most part inhabited only the more open timber tracts, where were seen tall dead and scattering trees. They would always alight on the topmost branches of these ancient monarchs of the forest, and keep a sharp lookout for approaching danger, and fortunate indeed was the sportsman who was able to get within range of them.

For reasons which I am unable to fully explain, scarcely an individual of this species has, so far as I am aware, been observed in northern Iowa during the last fourteen or fifteen years.

In the fall of 1876 the writer and his brother Merton, together with an old schoolmate by the name of Will Rumsey, spent some time in hunting on and around Lake Albert Lea, Minn. In the heavy timber at the foot, or southern end of the lake, which was indeed a beautiful one, we had rare sport in hunting wild pigeons.

Two of us would station ourselves behind trees in the heaviest portion of the timber, most frequented by these birds, while the others would beat the woods and "drive the birds around" in our direction, where from our covers we would shoot them as they flew swiftly past overhead. In this way the flocks were kept going until we had sufficient for use in our camp. The fall of 1876 is the last date of which we have any definite knowledge where this bird has been known to occur in numbers in the southern portion of Minnesota.

Some forty years ago the wild pigeon was often seen in southern and southeastern Iowa in immense flocks. In fact, then there were points in this State where these birds nested—"pigeon roosts," as they were generally called. These birds existed in veritable myriads, migrat-

ing in vast flocks, which sometimes reached across from the eastern to the western horizon.

For many years it has been generally understood that this species was practically extinct—exterminated by men at their roosts or nesting places, or decoyed by them into nets during their migration from one portion of the country to the other. The defenseless young birds were also destroyed by various means in untold thousands.

Whether this assertion is true or not, the apparent destruction of a species of such vast numbers over so wide an area in our country, and at so recent a period, is indeed one of these startling facts in natural history, and is paralleled only by the destruction of the buffalo and the prairie chicken.

Since writing the above we observed in Charles City, Ia., last summer a large wild pigeon in company with a couple of mourning doves, and at frequent intervals for a couple of weeks it was seen, and excited considerable interest.

CLEMENT S. WEBSTER.

Reason and Instinct.

Editor Forest and Stream:

Permit me to commend Mr. Wade's excellent letter in issue of March 11. A little slack-twisted science is all very well at times, between such friends as your correspondent and your readers; but then it ought not to be carried too far. For FOREST AND STREAM has a reputation to sustain and we must all look to it. A certain character in Carroll's delightful "Hunting of the Snark" had laid down for himself a sort of "modus vivendi," a good, easy, practical, natural, average, working rule, which I have often wished could be made the law of this whole broad land. It was simply this: "What I say three times is true!" Now, most any old rule will do if it is only understood and lived up to, and I take pleasure in bringing this forward, and suggesting a trial of it. We can, for instance, let it be said once, or even twice, that animals possess reason as well as instinct, and nobody is to say a word. But when it comes to be said the third time, may FOREST AND STREAM never lack a loyal reader who, like Mr. Wade, shall rise up and remonstrate.

And this leads me on. There is another of these slack-twisted ideas about animal instincts, which is forever making a nuisance of itself, even in good society; and it is high time it were well stamped on. It is called up by Mr. Wade's letter, in which he refers to it indirectly, though without endorsing it. It is the hoary old idea that animals teach their young what to do and what not to do. It depresses me to think how many excellent people and lots of ladies among them, are going to have to answer in the next world for writing, for instance, that they have seen parent birds teaching their young ones how to fly. They have, indeed, seen the young birds, impelled by instinct, at exactly the right period of their development, endeavor to fly, and endeavor with exactly the correct stroke and feathering which suits their wings and muscular power. And they have seen the parents hopping around, doubtless much interested, but not at all acting as if teaching a class in calisthenics, which lessons in flying would very much resemble if flying were not taught by instinct.

Similarly, at an earlier age, instinct taught the young to open their mouths, to cry for food, and to eat. And, similarly, many months after the young and the parents have parted and forgotten each other—but again exactly at the right period of their development—instinct will teach each bird to mate with the opposite sex, and will teach them to build the nest, and all that follows. It is surely not necessary to argue a question so simple, when once the all sufficiency of instinct is appreciated. But, if it were, the well-known phenomena of incubated chickens and of young birds and animals raised by mothers of other species, would furnish abundant argument. One further suggestion in the same connection.

In corroboration of the theory that wounded or frightened animals do not transmit their experiences or fears to their progeny, Mr. Wade cites as a strong example, the alligator, which rarely ever sees its own young. Strictly the question to which he refers, in citing the example, was whether the experience of ancestors is transmitted by inheritance to their progeny. I am reminded of a rare old story. A carpenter put to work upon a flat-boat tied up to a tree upon the river bank, wished to sharpen his adze. He told his son to take a bucket and go to the well and get a bucket of water for the grindstone. "Yes, father," said the boy, "I'll dip one here." And suiting the action to the word, he dipped one from the river as he spoke. "My son," said the father, "that is a good idea."

On the question of the inheritance of experiences, the best of all examples is the most obvious. For endless generations every human ancestor has known that fire will burn. But every human infant still has to acquire the knowledge for himself. Only after he has become a burnt child will he dread the fire.

JACK HILGIG.

Bird Notes and Other Strains.

PROVO, Utah, April 8.—On the evening of March 8 a small boy brought me a bird that I had never seen before in this region. His plea was to the point:

"Prof. W., I was down a-huntin' ducks an' there cum a reg'lar cloud of these 'ere birds, an' settled in the bull-rushes, an' I thought ye might want one to stuff, so I brung her up."

Other duck shooters told the same story of the unprecedented migration—a "cloud" of birds at night and all gone northward with the rising sun. The bird in question proved to be the evening grosbeak (*Coccothraustes vespertinus*, Cooper).

I noticed another strange migration on April 4. Five days previous I had been duck hunting, and had not noticed a single killdeer. On the afternoon of April 4 a tremendous flock of *Aegialitis vocifera* came from the South and dropped down by squads and platoons in every marsh for twenty miles along Utah Lake. The birds immediately proceeded to pair, and nesting is now well under way. The killdeer had for an advance guard a few jacksnipe that are now well scattered through the lowland country.

County Game Warden Myron Newell has been making it "hot" for violators of the new game law. Some two years ago the Telluride Power and Transmission Com-

pany built a dam across Provo River, the greatest fishway in Utah, and last year tons of trout failed to get over the fall, and were either captured, exhausted or dynamited in the pools just below the dam. This year both county and State authorities have taken the matter in hand, and as a result, provisions will be immediately made for the trout to get up the river to their natural spawning grounds. As Commissioner Newell and County Attorney Evans were on a trip to the power dam last week, they noticed where a large irrigating ditch had been diverted from its course. They soon came across two young men, one an old offender in this line of work, who were getting trout and mountain herring out of the drained pools. The boys threw their fish back into the water, but all too late. They are now serving ten days apiece in the county jail. Four others have also been convicted this week. Two of the outfit claimed that the trout had been made a present to them, but as they refused to tell the name of their munificent friend, they had to "pungle" \$20 into the county treasury—and the good work goes on.

SHOSHONE.

Snake and Trout.

Editor Forest and Stream:

The discussion running through recent numbers of FOREST AND STREAM on the subject of reason, instinct, heredity, etc., in the animal creation reminds me. Sometime in the 70s I fished for trout in streams (brooks) in York county, Pennsylvania, near what was known as the Jack Toean, and the locality will be recognized by your subscribers in York, Lancaster and Dauphin counties of Pennsylvania. At that time I could kill a good creel full, say 10 to 12 lbs., of trout averaging from 8 to 14 oz., and took none less than 6 in. in length.

Upon one occasion fishing up stream and coming to a bend in the stream, I was attracted by a noise that could not be made by the riffle of the water, because the water on the brook ran placidly and quietly over the gravel bottom. I stopped and listened for a few seconds before turning the bend in the stream. When I did turn the bend, I was very much surprised, as well as interested, in the fact that I was not the only one fishing for trout in the brooks. A water snake was also fishing. It had a trout, say 3 to 4 in. long, caught nearly in the middle, and was trying to get it out of the water, preparatory to swallowing. I watched the operation of the snake with great interest. It would carry the trout up to the margin of the stream and so soon as the trout touched the gravel it would "flop" back into deeper water. This was kept on for a few minutes, and I walked to within a few feet of the snake without its having taken any notice of my presence. When the snake found it could not get the trout out "head on" it turned, and took it out tail first, that is, it backed out and drew the trout out on to the margin of the stream. I was so close to the parties in interest that I put my foot on the snake, liberated the trout and sent it away rejoicing. Now was this reason, instinct, or what in the snake that taught it to carry the trout out of the water tail first when it found it could not do so head first? Will our good friend, Mr. Mather, please say if this snake, which I suppose is one of the descendants of the "old-time" fellow, inherited its cunning or only got it by the fall.

E. S. Y.

The Van Courtlandt Park Buffalo.

About two weeks ago the complete skins with feet and skulls of eight buffalo were received by Wm. W. Hart & Co., the Taxidermists, of East 12th St. These represented the last of the herd of thirty buffalo that were loaned by Austin Corbin to Van Courtlandt Park.

It will be remembered that the animals were given improper pasturage in the park and soon became diseased, one after another dying. When seven had died Mr. Corbin decided to remove the survivors back to his preserve in New Hampshire. He was obliged to leave one cow, which could not be captured. The others were taken to Newport, N. H. They were all sick and had to be kept isolated from the rest of the herd. They never recovered, and either died or had to be shot. The eight recently sent to Hart & Co. finishes the chapter of a sad and expensive experience.

These skins are cured and put in specimen shape and sold to museums for mounting. Wm. W. Hart & Co. represent the Austin Corbin Preserve at Newport, N. H., in the sale of their surplus live game such as deer and elk. Mr. Corbin still possesses probably the largest and finest herd of buffalo in existence, comprising about 100 head.

White Tigers.

A WHITE tiger is not often heard of, and in these days of skepticism the existence of such would be denied by many or accounts of its discovery would, at least, be received with extreme caution. That there have been well-authenticated cases of complete or partial albinism in tigers, however, admits of no doubt: there is Major D. Robinson's specimen (11 ft. 9 1/2 in.) shot at Poona, and the skin of one was exhibited, if we remember rightly, some nine or ten years ago in London, to go no further back for records. Now we have another instance in the tiger recently shot in the Dibrugarh District, Assam, by Mr. Greenish, of Nahorkutia. We have inspected the skin, and are inclined to think that in this latest instance we have probably the most perfect specimen of the white tiger ever obtained. The hair is perfectly white, the black stripes being in the skin, and only visible when the hair is wet, like the body markings on a fox terrier. The skin measures about 9 ft. 6 in. from tip to tip, and evidently belonged to a fine young tiger in good condition.—The Asian.

Locked Antlers.

MR. HARRY McCURT reports in the Chippewa Falls, Wis., Herald, the possession in that town of a pair of locked deer horns. They were found on the Manitowish in December, 1897. The animals had been dead for some time, and the ravens had destroyed the hide on the heads so that they could not be used for mounting at the time nor until the '98 season, when hides were obtained from freshly-killed deer. The two heads are interlocked with one of the horns on each.

Game Bag and Gun.

Winning Alaska Trophies.—II.

(Concluded from page 288.)

I now decided to get two good white men and one strong Indian, and go up the Sheep River country after bear, moose, and caribou. This was a hard proposition even to think of, as the name of Sheep River struck terror in the hearts of every one who knew of that treacherous stream. I talked the matter over with my esteemed friend, Dr. J. H. Gunning, vice-president of the Alaska Gold Syndicate Co., and one who loves to see every one make a grand success of what they undertake. He picked out two of his best men, tendered me the use of the strongest boat on the Alaskan shore, and told me where I might get an Indian who was noted for his skill with a boat and also as a daring hunter. I had quite a hard task to prevail on the Indian to accompany me, as he did not like the country I proposed going into. Yet sufficient "filthy lucre" and the promise of a beautiful rifle had the desired effect, and when I got all of my other preparations made, the Indian was ready.

The two white men who were to accompany me were men of powerful build and thoroughly acquainted with boating and all kinds of hardships. They were native-born Russian Finlanders, who could endure cold and hunger to the last degree. While getting ready we were constantly reminded of the great dangers ahead of us and were told of the number of people who had tried to get up this river; but all had failed in the attempt. Just a few weeks before a party of twelve powerful men, all experts in boating, had endeavored to ascend this tortuous stream, but they had got up only a short distance when their boats were turned over and their grub, tools and guns were scattered along the bottom of the stream. The water in this river comes from three large glaciers, and consequently is very cold and of an amber color, and it averages from 3 to 40 ft. deep. I provided our boat with a quantity of strong, light rope, and before starting saw that every article was securely lashed to the bottom and sides. Our food was of the plainest kind, principally beans, flour and coffee. The bedding was also of the lightest kind. Our wearing apparel was such that we were ready at a moment's notice to plunge into the icy waters and save our boat, as well as our own lives.

I will not attempt here to describe the different adventures and incidents which occurred going up this river, but suffice to say we worked our way up through the treacherous quicksands, snags, and sharp projecting rocks, which were ever ready to gore our little craft to pieces, and then the roaring rapids plunging down over the rugged boulders was enough to make the stoutest heart shudder. The Indian and one of my men seemed to weaken at this point, and it was only through a strong threat of using my little rifle that I compelled them to continue. I remained in the boat myself and kept her bow straight against the torrent, while the men on either side pulled on the long rope which I cast out to them. After crossing these rapids I had no more trouble with any of the men, as they seemed to have implicit confidence in what I told them and readily obeyed.

On the fifth day we reached the glaciers which are the source of the river; and what a sight here met the eye. I have seen the Horse Shoe Falls on the St. Johns, in Canada, the Niagara, and numerous other cataracts, but this, to my mind, was far more wonderful than any of them. The great high mountains on either side, like two giant arms, hold in their embrace that frozen body of crystal water, while the walls of the glacier itself were like great crystal planes, studded with immense stalactites. In places I walked for hundreds of yards on solid floors of ice; then suddenly came perpendicular walls; and in other places sharp pinnacles, like the spires of a thousand churches. The raging waters came leaping down from ledge to ledge, and formed into pools of boiling foam; then suddenly a large floe of ice would come crashing down, and the foaming waters in those icy basins would leap hundreds of feet in the air. I sat for hours watching these scenes, and thought of the immensity of nature; I had never realized it in all of its majestic grandeur before. I climbed from ledge to ledge, higher and higher along the mountain side, until I got to one of the highest points, and from here took observations of the surrounding country. To the north nothing could be seen but icy peaks raising up their shiny heads as far as the eye could reach. To the east and west were large bodies of water and rough, broken ground. To the south I saw a tract of apparently level ground, which looked like a great natural park, I should judge about thirty miles wide and forty miles long. There was a large lake on the west side, and a small one on the east. I returned to camp and determined to visit this natural park and see what it was like. On my way down the mountain I saw a small object about 700 or 800 yds distant, and as I got closer I saw it was a bird of some kind. I walked within 100 yds of it and placed a bullet in my rifle. At the first shot I cut a feather at the

tip of the wing. To my astonishment the bird rose and flew toward me. I now saw that it was a very peculiar kind of bird, and for fear that it might get away I slipped in another small shell, and this time the ball went through its breast. I picked it up, but could not find where the ball had struck it, the feathers were so thick; and it seemed to have two coats of feathers, besides a very heavy covering of down. I finally found where the ball struck, and while it made quite a hole, which is not at all discernible from the outside. The bird is a little larger than a pigeon; web-footed, with short legs, pointed beak, head and breast of a creamy golden tinge, wings a dark slate color, and extremely long and pointed, two black tail feathers about 18 in. long. What is it? When I got down to camp the boys had a good fire and plenty of dry logs for the night, and Nascelice (the Indian) had run up on the mountain side and got us a nice sheep; so there was no danger of starving while we had plenty of mutton in camp. The next day was Sunday, and I made it a rule, no matter where I was or what the circumstances, that there should not be a semblance of work done on that day. This may seem strange for a hunter, and a great many may scorn the idea, but it is my rule, both in business and pleasure, and I have never yet lost anything by it.

Monday morning we all awoke bright and early, rested and refreshed, and ready for the toils of the week. I noticed a large body of very peculiar-looking earth projecting out in the river. We worked our way down to it. I told one of the men to take the frying-pan along, as I had an idea that it was quartz. We took a painful of

out for some fresh meat, since our larder was very low in that respect. The Indian went in one direction, while I went in another. I saw several signs of bear and moose, but as I had never hunted any of those animals before, I hardly knew what I should do if one made his appearance, and since the stories I had heard of them were anything but pleasant, I hardly knew whether I wanted to tackle one by myself or not. These reflections were soon brought to a state of reality, for right before me stood a large moose, not 200 yds distant. He scented me the same instant I saw him, and as he started off on a swinging trot, I took a flying shot at him, and the ball struck a little below the ear. If a cannon ball had hit him he could not have dropped more quickly. I did not have a hunting knife with me and had to return to camp and get the men to skin him. When I got there the Indian had returned and looked quite crestfallen, as there had been no signs of game where he had been, and the other men looked anything but pleasant, for to be without meat with us meant a great deal, as that was all we had now to live on. Of course they did not think that I had seen anything, as they supposed if I had I would have come in all excited and wild with joy. Instead, I walked in as cool and sober as if I had not seen a thing. I sat there for some time and heard them making remarks about fresh meat, etc., and how they would like to have some. Finally I told them to get their knives and come along, and I would show them all the meat they could eat for a week. Every face brightened up at once, and with light steps they followed to where the monster lay. The Indian looked him all over, expecting to find a dozen or more shots in him. When he found the one little trickle of blood he looked completely beat. He had just told me that morning that my gun "good for ducks and sheep, but no good for bear and moose." We soon got the skin off and the choicest part of the meat ready to return to camp. How we did enjoy baked heart and tenderloin that night, while the great skin, thrown fleshy side down over some spruce feathers, made a bed fit for kings to rest on.

At 4 o'clock next morning we were on our way to look up grizzly, as the signs were quite plentiful around where I had killed the moose. The sun was just tinting the hilltops when we discovered two large objects on the side of a hill. On close inspection we could see that they were bear, and genuine grizzlies at that. Gentlemen, this was game, and we were "up against it." The ground was clear and open, and not a tree of any description within miles; and to tackle those two hungry-looking monsters on their own stamping ground was rather a delicate undertaking. However, it had to be done. Our Russian friend kept well in the rear, as he was not at all anxious to meet the enemy. The Indian acted as though he had not lost any grizzlies just at present, and I confess that I have been in more pleasant positions in my life. The closer we approached to them the quicker our hearts bumped against our breasts. The bears were browsing on huckleberries, and every few moments would rise on their hind feet and sniff the air. We kept out of their sight and worked our way up to about 500 yds. Here the Indian began to unrobe and divested himself of every garment that would hinder locomotion. His shoes and socks were taken off and his trousers rolled above

his knees. I looked well to my rifle, as in it was my sole dependence, and on my coolness and accuracy depended my life. The Russian and the Indian got quite nervous. It was plain that neither of them could be depended on. We were now within 200 yds and had a full view of the bears. The Indian made signs to me to shoot the large one and to aim at the shoulder. I did as instructed, and he and the Russian were to take the smaller one. I dropped on one knee and aimed behind the foreleg. At the signal we all fired. The bear I shot at raised up with a terrible roar and grabbed at his side with a paw and then dropped on his haunches. I supposed he was done for and began shooting at the other one as he was starting to run, but in a second both of them were up and started off as though they had never been touched. They must have run two miles before they fell. Had they seen us before we shot, our lives might have paid for our daring; but we took them with such surprise that they did not think of anything except getting away.

Our next bear was alone, feeding on berries, as the others had been. I told my men I wanted to tackle him by myself, and that I was going to shoot him in the head. The Indian objected to this very seriously, and in his own language told us he had shot one in the head seven times, but had not killed him. I thought of the moose I had just killed, and as he had dropped so suddenly with one shot in the head, I believed a bear could be killed in a similar manner if hit in the proper place. I got the wind in my favor and worked my way through the short brush until I gained the hill where the bear was feeding. As I raised my head above the hill he saw me. I saw he was anxious for blood, and with a roar that was terrible he came towards me. I kept perfectly cool until he got within 100 yds. I raised the little rifle to shoulder and took careful aim at the broad head. The ball went straight to the mark, and as it crashed through his brain he fell with a heavy thud and I could hear his

ALASKAN CARIBOU HEAD SECURED BY MR. HARRY E. LEE.

The horns have 57 points.

the mouldering formation and cleaned it out until we could see square flakes of yellow metal. I crushed some of them under my teeth, and as they were soft and pliable I knew at once that it was the real thing. I located this body of ground, and also seven other places of a similar formation, and I expect to open them up myself; and if they prove good, all right, and if not no one else will have anything to lose; but I am not afraid to risk a few thousand on it. I had no idea of finding gold when I went to Alaska. I went up strictly to get some specimens of large game, and was in no way prepared when I discovered those ledges. But as fortune has favored me in that respect, I do not propose to throw away the opportunity.

We now decided to go down and see what this level country was that I had seen from the mountain, and after two days' hard work we got into the park. In some places the soil was very rich and there was a heavy growth of red-top grass 3 and 4 ft high, with spreading shade trees scattered around. A little further on we came to a high rolling country. The high ridges were covered with short grass and moss, while the valleys were about knee deep in a coarse, heavy grass. Pure, perpetual springs of the best water ever tasted were bubbling up from the hillsides and winding their way down the valleys to the lake. I think I never saw a better pasture for cattle, horses, or sheep. I found here the wild strawberries, the salmon-berry, black and red currants in profusion, and the finest red raspberries I ever tasted, while the hillsides were literally covered with huckleberries. The air was very pure and quite warm. The trees were principally spruce, quaking-aspen and birch.

We made camp near a beautiful little stream, and while two of the men were getting things fixed for the night the Indian and myself shouldered our rifles and started

[* Probably a skua, one of the piratical gulls.]

jaws snap in his dying struggle. The men ran to where I was and wanted to go up to him at once; but I made them sit down and eat berries for at least ten minutes, while I kept a close eye on the bear, for my past experience with big game has taught me never to go too close until I was sure the last breath was gone. The Indian jumped in the air several times and said, "Good gun; good gun;" and wanted to make a trade for the arm right there; but it was not for sale at any price. I now left them to skin the beast, while I kept on over the hill in search of caribou.

I could not even see a sign and returned to where I had left them. They had been more fortunate, however, and pointed out a large herd on a hill about two miles distant. The Russian took charge of the bear skin, while the Indian and I started after the caribou. On our way over the hill we saw four large bears feeding on a little knoll about a mile to the right. It was a temptation hard to overcome, and I hesitated for some time whether to continue after the caribou or to try conclusions with the four bears. The Indian seemed to read my mind, and very wisely suggested that if we shot at the bears the caribou would run away and we would not see more, while bears were plenty and we could get them any time. I think he had two reasons for making this suggestion. The first was that he did not like the idea of meeting four bears at one time, and the other was that he was quite tired. We had no time for parley and continued toward the gentler game. The great horned beauties were on the open barren, and it was no easy matter to get in range of them; but by crawling on hands and knees for a quarter of a mile, we got within 300 yds. I told the Indian not to shoot at any of them, as I wanted to pick out the ones I wished myself. The largest one to be seen was lying down, and as I rose up to get aim on him he jumped to his feet and started. I pulled down on him and missed. The second shot was better, and he fell at the crack of the gun. We walked up to where he lay, supposing that the others had all gone, but to our surprise nine or ten came down to him and looked in wonder at us. I saw that one of them seemed to be monarch of the herd, and that the one I had killed was only a fawn compared to him, so I drew down on him and the ball entered the neck and lodged in the back of the head. (The men found the little bullet mashed flat while skinning him.) This was the handsomest animal I ever saw on four feet. The remainder of the herd ran off about 100 yds from where the leader had fallen, and turned again to see what we were or what we were doing. I noticed a very peculiar one with two rows of white spots along the sides, and thought I would like to have him. At the report of the gun he jumped in the air and ran about 50 yds., then fell. Several more came around the hill and joined those we had been shooting at. The band now numbered about eighteen. I could have killed more, but had all I needed. It was now nearly sundown, and we were too tired to skin the animals, and decided to leave them where they lay until next morning. It was a great risk, however, as the bears were quite numerous and there were many prowling wolves.

At 3 o'clock the next morning we were up and started back for the skins and some of the meat. We were not one moment too soon, for several bears had scented the dead animals and were going directly to them. We intercepted two of the bears, and after a very interesting experience, which I have not time at present to relate, we added the skins of two large grizzlies to our collection. Another one was also brought to bay before night, and when we reached camp and had broiled some caribou steak, we lay down, and did not need rocking to put us to sleep.

The next day was Sunday, and we were all glad of it, as there was no work to be done on that day, and we all enjoyed a good rest. In the afternoon we walked up on a little hill above camp to eat berries; the ground was literally black with them. In gazing around on the valleys below and admiring the beautiful scenery, I discovered a large dark object among the spruce trees. I saw that it was an immense bull moose, his great wide antlers spreading out on either side. I called the attention of the men to it, and one wanted to go at once to the camp and bring my rifle, but I told them no, I would not shoot on Sunday, if I never got a moose. Yet this was the only animal I needed to make my collection complete. The Indian told me that by morning the moose would be gone away. This did not change me a particle, though, and the subject was dismissed for the time. Presently another large moose stepped out into the open. He, too, had a wonderful spread of horns. Now the men were nearly wild for me to secure one of the two; but I was still firm in my resolve, and after watching their peculiar antics for some time we returned to camp for the night.

At daylight next morning I awoke and gave orders to the men. Two of them were to get breakfast ready, while one of them was to accompany me. I went straight to where the game was last seen, and with eyes and ears

ready for the slightest sign or noise we crept stealthily along. I expected the animals to be lying down, and as the grass and underbrush was very thick and nearly 4 ft. high, it was a hard matter to see any animal when lying down. I was mistaken, however, for I soon came to a warm lair where one of the moose had just left. The footprints in the dewey grass were quite plain, and we were soon on his trail. We almost held our breath, for the slightest sound would betray our presence and the game would be gone. The tracks in the grass led over a little hill, and as we stood scanning the valley in front a crashing noise was heard to the right and the moose started on a rapid trot, with his great antlers high in the air. It was a beautiful sight, and one I shall never forget. He ran straight from me, and the only fatal spot exposed was the back of the head. I sent a bullet whistling after him, and it went between his horns and struck a tree in front of him. This seemed to surprise him, and he immediately turned to the left and gave me a broadside shot. I took careful aim for his shoulder, and as the little gun spoke the great animal sank to his knees, and then on his side, where his proud, tossing head was soon at rest. On our way back to camp I could have killed two others, one of which had a much finer head than the one I had just secured, but nothing could induce

MR. HARRY E. LEE AND HIS ALASKAN MOOSE HEAD.

me to kill them. If they have not been killed this winter for meat they will make a nice prize for some lucky sportsman next fall. I would like to suggest that the American sportsmen should by all means try to secure this tract of land from the Government as a game preserve, and I hope someone will take the matter in hand before another year, for the game is wantonly killed by market hunters every winter, and if this is not soon put a stop to it will be entirely exterminated.

When we returned to camp the Indian was very much impressed that I had found the moose where we had seen them the day before, and hardly believed that we could have got one so quickly until he went down to help get the skin and head. By securing this moose I now had accomplished every purpose that I had come to Alaska for, and in fact I had secured far more and much finer specimens than I had ever hoped for, and without an hour's sickness a scratch or an accident. I thought it truly wonderful. Now came the task of getting the heads and skins to the boat, which was about nine miles over a very rough country. Each one took his load, and we expected to reach camp that night; but our loads were too heavy, and the underbrush so dense that we did not get much more than half way and had to lie down in the swamp for the night. We had no shelter, and the cold rain which fell during the night was anything but pleasant. When we reached camp the river was rising very rapidly, and we had hard work wading out to where our boat was tied. We took it in on high ground, and the men returned to the hills for the other skins and heads, which we could not begin to bring at the first load. I remained at the camp and salted the skins and got them ready for taking down to the coast. During the afternoon I noticed the river getting higher, and higher, until all of the lower banks were covered, but

fortunately our tent was on a bluff about 40 ft. above the stream. Dark clouds in the northwest indicated a storm for the night and in a few hours came such a hurricane as I had never witnessed. I had brought stout ropes from the boat and had fastened the tent down as best I could, but the fierce winds threatened to blow it into the river, which was now a roaring torrent. I have put in some bad nights in camp, but never experienced another one like this. Toward morning the wind calmed somewhat, but the rain and sleet came down faster and faster. I was worried about my men, knowing what dangerous places they had to cross, and was quite anxious for their return. I was also uneasy about the rough-looking logs that were tearing down the river, as they frequently formed a backwater, and woe to the craft that comes against them. Sharp snags are often projecting which tears a hole in the strongest boat, and the rapidity of the stream will sometimes force a boat over or draw it under and in either case not only are the boat and its contents lost, but the lives of all connected with it.

At about 4 o'clock in the afternoon I heard the men cutting their way through the fallen timber. The poor fellows were nearly exhausted. I had cooked everything left in our camp for them, and it did me good to see them devour it. I also had cut some spruce logs and had a good fire to dry out their drenched clothes. We retired early for the night, for none of us had had any sleep the night before.

The sun was well up when we awoke. The storm had almost abated, but the river was tearing down everything in its path. The banks were caving in on all sides and large trees were being swept along as if they were chips. Soon our boat was ready, and a number of the skins and heads which I had worked so hard for were piled in. The large horns were projecting over the sides, and the tent and camping outfit, with the four large men, brought the gun-wales well down to the water. It was a risky load on such dangerous waters. Everything was lashed securely, as we fully expected an upset before we got half way down, and each man was ready to swim for his life. The bends of the river were sometimes sharp curves, and it required all the strength and skill that we possessed to keep off the rocks, or prevent being drawn under the embankment. A number of times our escape seemed miraculous; but fortune favored us, and swift as an arrow we sped along. Soon our eyes were gladdened with the sight of the broad meadows, but they were now almost covered with water and looked like a great lake. The mast of our sail boat was the next glad object that met our view, and it only required a few moments to be alongside of it. One of our party had a watch, and looked at the time when we started and when we reached the mouth of the river; and what had taken us five days to go up, we came back in three hours and twenty minutes.

The little islands and dry spots along the banks of the river were literally covered with ducks of every variety, while thousands of geese and swan were hovering in the air. I secured with my rifle quite a number of the latter, and also several of the eider duck. I found the little miniature bullets just the thing for this class of shooting. I was also fortunate in securing some grand specimens of the tufted puffin and a variety of other birds, which are only found on the coasts of Alaska. I

value my collection of feathered game almost as much as the fine specimens of large animals which I secured, and in fact there are some of them that I think more of.

When we arrived at the coast we were met by a large crowd of brawny but good-hearted prospectors, and when they saw the great variety of animals and birds they were nearly wild with joy, and when we told them of the ascent to the head of the Sheep River without accident or mishap they were perfectly astonished.

We then showed them the ore specimens which were taken from the quartz ledges and told them of the beautiful country which surrounded this new gold find. Not only their looks brightened, but their minds changed, and several who had arranged to return to the States decided to remain in Alaska and make a new effort to secure a fortune in the fastnesses of those unknown hills which nature has made rough and almost inaccessible in order to guard her richest treasures. The eastbound steamer was at anchor in the bay, but I could only secure a limited space for my trophies and could only take about half of them. I then decided to take passage on that staunch little schooner, the Nellie G. Thurston, which was also at anchor and would sail direct for Seattle in a few days. I found on this schooner just the space I needed, and the novelty of a schooner ride on the outside course was quite to my taste. The officers and crew were the jolliest lot of fellows I ever met, and the courtesies of Hon. Thos. C. Dunn (owner of the boat, who was also a passenger) will never be forgotten. In thirteen days we arrived safely at Seattle, and while I was delighted to get back to civilization again, I shall always look back with pleasure to the grand old mountains, the rapid, rolling rivers, the great moving glaciers, and the animals and birds as I saw them in their native element.

CHICAGO, ILL.

HARRY E. LEE.

CHICAGO AND THE WEST.

Sportsmen Win in Illinois.

CHICAGO, Ill., April 15.—The sportsmen of Illinois and of the West are this week to be congratulated on winning at least a part of the foughten field at Springfield, where, as set forth in last week's *FOREST AND STREAM*, the passage of the dangerous Senate Bill No. 43, and its counterpart, House Bill 434, was so strong a probability as to excite the liveliest apprehensions. In the result, while Illinois is by no means to be congratulated on having a model or even a desirable game law in this new measure, which was this week passed, it may at least be said that not for a while, at least, will the city of Chicago be a legally wide open game market the year round. Western game will still have to come in here under cover, smuggled, stolen, hidden, and not openly and defiantly as in the city of Boston. The dealers of this city will have to go on another session or so before they can secure the wish which they have openly expressed for years—of being placed on an equal footing with the open markets of the East. Let us hope that, before they ever do succeed in their effort to have this measure enacted public sentiment will so far have grown in intelligence that the people will block all such effort and set on our statute books a law which shall still further make difficult the way of the transgressor.

I do not wish to be understood as saying that the measure above referred to was intentionally made a dealers' bill, and I do not say that the lobby of South Water street had anything to do with this bill, to the knowledge of the backers of the bill, yet it was obviously clear, as shown in last week's *FOREST AND STREAM*, that the dealers would have had reason to hug themselves had not a few of the more interested sportsmen gotten together and corrected the innocent-looking little clause of Section 1, which was so near and yet so far from being identical with the old statute, and which, if passed as it stood at this time last week, would have left this a wide-open town. The chief credit for this action, I imagine, belongs to F. S. Baird, of the law committee of the Illinois State Sportsmen's Association, who was the first to detect the true inwardness of Senate Bill 43, and the foremost in the fight to correct it. Mr. Baird wrote many letters and sent many telegrams to representatives at Springfield, and was the only man to get to Springfield and engage in personal supervision in the final stages of this bill. Mr. R. B. Organ was of great aid also in letters he sent to the capital city. Others aided as they could, and the result is shown in an amended Section 1, which tallies in part and for the most part with the recommendations made by the committee of sportsmen whose action was last week reported. Not the least to be mentioned in this connection is Warden Loveday himself, who, in accordance with his promise to the committee on last Saturday, was the first to arrive at Springfield (on last Monday), and set to work with the committees of the House and Senate to get the insertion of the omitted names of certain birds and animals. He had the thing along to second reading by the time Mr. Baird arrived. Then there was a delay in the printing of the amendments, which looked threatening for a time. Mr. Baird copied from the House journal the amendments which had been passed, went to the printing office and ran the thing down there, and by Wednesday afternoon was able to return with the assurance that the work was done as had been agreed, and that Section 1, the much mooted, was shorn of its danger. Mr. Baird kept faith strictly in this work, and asked for nothing more than what had been agreed at the meeting at Warden Loveday's office. Mr. Graham, attorney for the Chicago School Board, was down there with the intent to kill the whole measure, and of fighting Warden Loveday on the supposition that the justices of the peace had held back funds due the school board under the old law. He was told that the fight would have to be made without the sportsmen, as the latter were pledged to confine their work to Section 1. As the new law comes out Mr. Graham will hardly be pleased, for under it the school board will get no part of the fines at all. So far as this is concerned, I can see no reason to call this objectionable, but rather better than the old law. School boards have nothing to do with game protection, and it would appear clear that the funds raised by confiscations ought to be used for paying in the work of protection and not applied to alien uses.

The Real Amendment.

The real amendments that were passed to the bill subsequent to last Saturday are as below:

Amend printed bill by inserting after the word "any" in line 3 of section 1 the following: "Wild buck, doe or fawn, or wild turkey, between the 15th day of January and the 1st day of September of each and every year, or any pinnated or ruffed grouse, prairie chicken, pheasant or partridge between October 1 and August 31 of the succeeding year, or any."

Amend section 1 of printed bill by adding after the word "State" in line 29 the following: "Provided, that the animals, fowls and birds mentioned in section 10 of this act shall not be killed for a period of five years from and after the taking effect of this act."

Amend section 4 of printed bill by striking out all of line 6 after the word "each" and inserting therein the word "offense."

Amend section 19 of printed bill by striking out the words "propagation and" where they occur in lines 4, 9, 22, 25 and 29, and by striking out the same words in line 5 of section 23 and line 13 of section 28.

Amend section 10, line 4, by striking out the word "wild turkey."

Study of this main amendment to Section 1 will show that it is not identical with that agreed upon with the warden last Saturday, though it covers the open market question perfectly. The changes made are perhaps those due to the hurly-burly and general mixed-up condition of legislative committee work. Thus, it will be observed that the date for shooting ruffed grouse is not made the same as that on quail, as was agreed at the joint meeting last Saturday. Instead of making the ruffed grouse season Nov. 1 to Dec. 20, as governs on quail, it is now set to be the same as that on prairie chickens, which can be killed only in the month of September. The absurdity of this from a sportsman's standpoint is obvious.

There was a rumor out to-day, which I cannot at this writing verify, that as finally engrossed Section 1 omits to specify wild turkey in any way, this bird having by some error been dropped as were earlier the others over which the fight was made. Mr. Baird thinks this rumor

is without foundation, and that the bill is substantially all right now, and is amended only as shown above. If, however, the name of the wild turkey is dropped out by some chance, then the effect will be that the wild turkey is protected in this State for five years, but all wild turkeys from outside this State can be sold the year round. If it does appear in the amended Section 1, as I think most likely, then this bird can be killed in this State during the month of September. This is conceding nothing. The wild turkeys of Illinois cut no figure, but those of Texas and the Indian nations do amount to very much more from the standpoint of the hunter, the naturalist and all those interested in the preservation of these birds in America.

Sportsmen who like to shoot jacksnipe in the spring will note that under this new law they will have to put up their guns at April 25. The mourning dove will have a new right to mourn, for it is made a game bird now, with an open season of Sept. 1 to Dec. 1.

A Possible Virtue.

There is one little thing in this law which may not be yet brought to the notice of the framers of the bill, and which may prove to be one feature where the sportsmen got something which they were not expecting, and where the game dealers got something they were not looking for. Please note carefully Section 10, which reads:

"Sec. 10 That it shall be unlawful for any person or persons in the State of Illinois, for and during the period of five years from and after the passing of this act, to injure, take, kill, expose or offer for sale, or have in possession except for breeding purposes, any wild buck, doe or fawn, wild turkey, ring-neck, Mongolian pheasant, any green Japanese pheasant, English pheasant, any copper pheasant, or Scholmeringon, any Trogapan pheasant, silver pheasant or golden pheasant, any Cacusis, any chucker partridge, and sand-grouse, any black India partridge."

There is a chance for construction in the above section, and it seems to me that the prohibition for "any person or persons in the State of Illinois," to "have in possession except for breeding purposes," or to "offer for sale," any "wild buck, doe or fawn," may fairly and clearly be construed to mean that no one can sell venison in Illinois at any season of the year whatever. This would be something of a back-handed blow at the "Street," which would be one of the best jokes known in the turbid record of Illinois game legislation. It is no difference what the framer of the law intended to say or what the legislators thought they were doing. There is what they did, and on this the courts, it seems to me, have a chance to pass. I saw this thing at the meeting at Mr. Loveday's office last Saturday, and at that time showed it to Mr. Baird, and we agreed not to say anything about it, but to let it take its course and turn out for what it is worth. Not to take too much credit for this questionable benefit I would say that a young daily newspaper reporter, whose name I do not know, pointed this item out to me as we sat near together during the meeting. Whether there is any good fight in this or not, it only goes to show what may be the capabilities of the English language when in course of use at the city of Springfield. Should this comment come to the knowledge of Governor Tanner before he signs the bill it will perhaps be in his power to close this market to venison the year round for five years, a thing which many persons on South Water street would think a horrid act for him to do; or he can fail to sign the law at all, in which case we will still have our old game law, which in many points is safer and better than this one, in which I can see no real progress whatever, either in local protection or in the problem of limiting the trade in Western game. Without doubt this part of Section 10 was intended to apply to Illinois venison only, yet it does apply to all venison, for no restricting words are used, and it is not stated that the buck, doe or fawn is or is not to be an Illinois buck, doe or fawn. Here is an instance of a section wider than it was intended to be. Section 1 is an instance of a section which was very much narrower than it was intended to be, in one sense, in that it left out part of the things it was intended to cover. All of which goes to prove that monkeying with the game laws is a dangerous thing all around, and which proves also that we shall never really know what we have got in this new law until after it is printed and signed by the Governor, and more than that, tested section by section in the courts. It is a very grave question if we can consider the ground won in the Supreme Court of this State as ground not to be fought over again. We do not know what we have got until we have learned it all over again by experience, which may be bitter. But this is what we have, or think we have, at this writing, and it is plain to be seen that a very important and substantial advantage was gained by the sportsmen's committee in the work whose story has occupied space for a couple of weeks in these columns. Mr. Loveday can hardly recognize his own bill in the form which it now has. The first draft of the bill was a very different affair from this. He says that in that first draft the names of the birds omitted later were included, and he does not know when or how the nearly fatal omissions occurred. No copy of this first draft can be obtained to-day, so far as I know, and I never saw any such draft. But of course all this is immaterial to-day. An old Irish lawyer, an acquaintance of mine, used to say: "Ah, me boy, ye can git up yer case the best way in the worrld, an' ye can have the purtiest brief that ivver wuz, and have anny number av cases pat to yer fingers' ind—but wait till the swearin' begins! Ye don't know where ye are till the swearin' begins, an' after it's over, bedad, sometimes thin ye don't know."

Wyoming Breaks Out Also.

The license idea is gaining ground in the West right along, as I have often had occasion to remark, and it is pretty hard to tell just where it may stop. The last thing is from Wyoming. When you have to pay a \$40 non-resident license, and then on top of that have to hire a guide, no matter how good a mountain man and hunter you are yourself, that looks a good deal like hunting under restrictions, which take away the charm and make the hunt not a hunt but a personally conducted frost. This is outstepping the tab and ticket methods of dear old Maine, where they have numbers on the deer's horns, showing which are next to be shot and where they are to be shipped. I presume most of us folk from this part of the world would like to have a guide if we went to a strange part of the Rockies, and surely guides are good company in most cases, whether it be for business or not;

but wouldn't it be a little more pleasant if the hiring of the guide were left a matter to be regulated by preference and not by law? I shouldn't mind the license part of it—if I had the price—but I confess I don't like the notion of being told that I must have a guide whether I like the color of his hair and eyes or not; that all my rising up and sitting down must be watched by the never-sleeping eye of Wyoming as per the aforesaid guide, who is to have his hand continually on my collar and his beak continually in my financial heart. Still, big game hunting is a thing chiefly for the rich nowadays, and the game has been disappearing so fast that I do not blame the residents of Wyoming for taking radical measures. If this new act, stringent as it is, shall keep out the butchers, and if it shall let in only a few good hunters, and if these few shall be so closely watched by intelligent and virtuous guides that they dare not lapse from rectitude, then this Wyoming law will protect the game as well as comfort the guides. There are several ifs to this.

I get part of my advice on this Wyoming law from Mr. Wm. Wells, of Uinta County, Wyo., a contributor to the *FOREST AND STREAM*, whose writing always has something to it, and who is very well known to most of the big game hunters of the East as a thoroughly reliable man for consultation about a big game trip. Mr. Wells writes me as below:

"Gros Ventre Lodge, Wells P. O., Uinta Co., Wyo., April 5.—Dear Mr. Hough: I have neglected writing to you for some time. We are having a winter up here to be remembered. Snow over 4ft. on the level, and very little thaw as yet. Two of the boys in from the Big Gros Ventre, where the main herds of elk are, report the elk doing well and no dead ones, and enough grass showing up on the south slopes and ridges to furnish plenty of feed. The elk and deer here on the head of Green River are all O. K., but I am worried about the elk and antelope on the desert. Still they may be all right, as reports from the Big Pineys say not much snow down there. I suppose you have seen the new Wyoming game law. It is a radical one, \$40 license on non-residents, compels all guides to be registered, and who must be bona fide citizens of Wyoming, thus blocking out all the Montana and Idaho guides. No non-resident can hunt unless he has with him a registered guide. Amount of game to be killed by one person yearly limited to two elk, two deer three antelope, or sheep and one goat. This amount of game may be taken out of the State by the person killing it. Open season on big game, September, October and November."

I had cherished as one of my dreams a little trip out to Mr. Wells' Gros Ventre Lodge some day before very long, as I know he is in a splendid game country; but if the license keeps on rising and the price of poetry rules low, as it has for the past few years, I don't see how I am going to make it connect all around. I have always wanted to get into the Wind River country. Yet when I reflect that this is the way the Wyoming men get back at the Eastern butchers who go out there and kill a hundred elk on one trip, as reported in recent letters from Mr. Daniels, of this city, then I am free to say that I do not blame them a bit on earth, and I would be still more rabid if I were a Wyoming man.

How about Michigan.

In the slang of the day, it is up to Governor Pingree now in Michigan. He has said that he would veto the Leidlein bill permitting spring shooting in Michigan, and it is now his privilege to do so. The following letter was yesterday addressed to Governor Pingree by a gentleman of that State, who has always been very energetic in his efforts at practical game protection, and I hope it may be of weight sufficient in connection with Governor Pingree's good judgment to stop the backward step in good old Michigan. I need not, under the circumstances, mention the name of the writer, whose communication is as below:

"Hon. H. S. Pingree, Lansing, Mich.—Dear Sir: I am gratified to learn on reading last night's paper that you have taken a stand toward vetoing Senator Leidlein's bill permitting spring shooting, and I cannot urge too strongly in behalf of the sportsmen of Saginaw and in behalf of the true protectionists of game that you maintain this position. To permit, at this time, spring shooting would be a step backward in game protection. For years, the energetic sportsmen and game protectionists have labored to have laws enacted preventing the shooting of these breeding birds in the springtime, when they were paired and mated, and when the destruction of one meant the destruction of an entire brood. At last, by conference, the Legislatures of Illinois and Wisconsin agreed to abolish spring shooting, with the understanding that Michigan did likewise, and the promise was well kept two years ago. The claim has been made that if spring shooting was allowed in one State, the selfish greed of the neighboring States demanded the same privilege of slaughter. Now, I say, the two neighboring States have a law that prevents spring shooting, and Michigan cannot afford to have her honorable reputation tarnished by going back on this agreement, or even without the agreement, by taking this barbarous step backward. In the State of Ohio they are even more rigid than we are here, and not only do they prohibit spring shooting, but in many localities the shooting of ducks is limited to three days per week during the open season in the fall. Every one who is interested in the subject has agreed that too much cannot be done to protect game birds and fishes and song birds, for with the rapid diminishing of our forests their natural covers and their natural places of breeding and feeding have become so scarce that the songsters and the game birds naturally decrease. With the aid of modern firearms and especially the pump gun in the hands of those who have no sentiment for the songsters and care no more for the game birds than the dollar they will bring, and which fill the pot for them no more acceptably than a chunk of pork does, the work of slaughtering goes on."

"I do not want to burden you with many long letters, but I am very warm on this subject, for I do not want them to disappear like the buffalo and wild pigeon have. Show this letter to my friend Chase H. Osborn, ex-game warden; he may want to use some portions of it, and I know he is a practical game protectionist and can readily distinguish between the pot hunter and the unselfish citizen."

The Neighbors are Good.

I surely do have good neighbors. For instance, look at this, which comes from my friend, Maj. T. G. Dabney ("Coahoma"), of Clarksdale, Miss.:

"I picked up an old volume, or part of one, which I read with much interest, and think it may be of interest to you. I will mail it to you, and if, after examining it, you place any value upon its possession you may regard it as your property."

"The book is an itinerary in diary form of an expedition commanded by Lieut. Zebulen M. Pike, U. S. A., as officially reported by himself, from St. Louis to the sources of the Mississippi River, in 1805-1806."

"Also a second expedition to the sources of the Arkansas, Red River and Rio del Norte."

Now, that "Coahoma" should have stopped building levees and catching snakes for domestic purposes is not altogether so surprising, but that he should so nicely hit the very dearest wishes of a fellow man, who is many hundreds of miles distant from him is the singular part of it. It happens to be one of my manias to get hold of all the old books on early Western life that I can find.

Witness the great good fortune by which Mr. Horace Kephart, of St. Louis, made me a gift of that very dear old book, Mr. Howe's "The Great West," which dates back to 1855. Yet this old treasure of "Coahoma's" is still older. The Pike narratives, of course, date 1805 and 1806, and this worn old copy seems to have been printed not much later than that date. It is soiled, and stained, and torn, and bruised, but its good leather backs holds many a good hour's reading. Sturdy, devout, expansionist Zebulon Pike, what a good time he did have in the days when Louisiana ran all the way to the British line on the North, and nobody knew how far West! Perhaps some day I may find something curious in this old book for Chicago and the West.

And this does not end the chapter of good neighbors who send in things which I need and things which I love. I don't know why they do this, but they do. Thus, I have another letter which touches me, bearing as it does upon the belongings of a good sportsman who has closed his chapter of sport and put aside his gun and rod forever. I don't know that I ought to print such a letter, but these things all seem to me to belong to the family. It is from Mr. Wm. Cuppage, of Newkirk, Okla., and reads:

"I used to be very fond of fishing, but have not done any since '70. I have some flies which belonged to my brother, Col. C., who used some of them in India, Norway and Great Britain. He died in '72, and I have had them ever since. It is not likely I shall use them soon, and if you could use them I would mail them to you. They will be spoiled if I keep them much longer, and I would like some one have them that would appreciate them."

I hardly need say that I wrote Mr. Cuppage that I should always keep safe these things which his brother prized so much during his life. No doubt their former owner knew FOREST AND STREAM, and derived pleasure from it, and these possessions which come back to the FOREST AND STREAM have a certain fitness as well as a pathos of their own, and should be sacred.

Personal.

Capt. O. C. Guessaz writes from Havana, Cuba, that he is dead in love with Cuba, and is going to locate there when this cruel war is over. I don't altogether like to hear this, as it will rob San Antonio of one of its main delights for me. Captain Guessaz tells me that Cuba is by no means without sport, for he has found six beves of quail in a half hour's tramp. He says also that the streams are numerous and clear and full of fish, and all in all he thinks he has found the promised land. As to the yellow fever, he scoffs at it and says there are men in Havana who never heard of it, who have been living there for years. Guessaz is indestructible himself, and I imagine will never discover there is any such thing as sickness so long as there are such things as quail. I am glad to be able to add that he comes back to San Antonio for the summer, and may possibly come around by Chicago. This last is a part of the programme which he had better not omit.

Minnesota.

Having been partially off the earth for some time I have not at hand the new Minnesota game law, which I take it is now passed. Last week the Minnesota Senate passed an amendment abolishing spring shooting; and asked the House to concur in this act. A section was passed compelling all non-resident big game hunters to pay a \$25 license, residents to pay a 25 cents license fee. Brook trout were forbidden to be sold till 1902. Spear-fishing with artificial light was prohibited. I take it we may depend on these features going through all right, and may congratulate Minnesota as being the one State to come close to living up to the interstate wardens' convention, whose bill has been often referred to in this paper. There is progress in Minnesota, though in Illinois we can write a whole book on Looking Backward.

Opening Day.

To-day is opening day of trout in Wisconsin, and as we have had a week of beautiful warm weather, it is more than likely that on a few of the earlier streams, such as the White River, and other streams near Princeton, to say nothing of waters lower down in the State, there have been some trout taken. The best of the sport on trout in that State, however, will come a little later, and 30 days later will be far better for the fly. Bait fishing, and that for dull fish and in uncleared waters, is the history of most first weeks in this section.

Snipe.

The snipe are in. Frank Bissel a week ago reported a good number of snipe at Water Valley, Ind., where he was shooting ducks. Yesterday a bag of twenty-one snipe was made on the Skokie marsh, north of Chicago. The past five days have been exactly right, and I highly recommend anyone caring for snipe shooting to have himself ready for this coming week. The best known Kankakee points should be productive.

Singing Mouse No. 13.

Mr. Harry S. Loftie, of Syracuse, N. Y., writes me about a singing mouse which he has captured, and I give this as Singing Mouse No. 13 in the FOREST AND STREAM series. He says:

"I have in my possession a singing mouse, or, in fact, about as near as you can come to it. It is not any different in appearance from the ordinary mouse, but his voice is where the mystery is. Before I caught him we were trying hard to discover where the noise came from, as at times it resembled a canary bird exactly. A great many notes sounded exactly like one, only not very loud. It could be heard at a distance of 100ft very plain. But since I have had him in a cage he does not sing any in the daytime, but some nights he will sing and chirp for hours at a time. No one has ever heard anything like it. I wish you would kindly give me a brief history of the singing mouse, and I will be much obliged to you for your kindness."

I cannot give Mr. Loftie very much of a history of the animal known as the singing mouse, except to say that it is well accepted by scientists, though no one seems to have discovered what it is that causes it to sing or enables it to sing. I have heard it suggested that the singing note is only uttered by mice that are diseased, but this I take to be a merely fanciful and unsupported assertion. I discovered a singing mouse—or rather two of them—before

I had ever read or heard of any such thing being known. It was at first rather hard to believe one's ears—or rather his eyes and ears together—for it does not seem natural to hear a mouse sing. Yet once in a while a mouse does sing, and very sweetly and thrillingly, too, as Mr. Loftie has by himself also discovered. I beseech him to take care of the little creature, and hope it may live long and prosper. I never owned a singing mouse myself, as both those I heard were not captive. I imagine there are few persons who can claim such live stock. The few specimens of singing mice of which I have heard in captivity did not live very long. I hope Mr. Loftie may have better luck with his.

E. HOUGH.

1200 BOYCE BUILDING, Chicago.

"Concerning an Epithet."

"How absolute he is! we must
Speak by the card, or equivocation will
Undo us." —Hamlet, Act V., Scene I.

Editor Forest and Stream:

Your Philadelphia contributor, Mr. Childress, seems anxious to continue a controversy that has already taken up far too much of valuable space in the columns of your paper, but as he insists upon holding me strictly to the letter of my remarks and asks certain questions relative to them, in order to place myself right before your readers, I will, with your permission, answer them.

The gentleman charges me with having in a prior article made an argument, thanks! I attempted none; life is too short for that sort of thing; I merely made a few statements of individual opinion, I would much rather run a foot-race any day than get into an argument and am no sprinter at that. But to the questions. Ques. "Would Mr. S."—meaning me—"if clothed with full authority, kill a man for taking more than his share of game in a day?" Ans. Not on your life; probably wouldn't say a word about it to him either, if he happened to be large and appeared to be vigorous. Our friend must not imagine that when a reader of FOREST AND STREAM tells him that his trigger finger itched with righteous indignation, or something like that, that he is "intent on murder bent," the language is figurative only. The great family of readers of that paper are too well bred to even mistake a man for game and kill him that way, they always have in mind the maxim "when you shoot be sure you know what you are shooting at." But this is digression; let us get back to our sheep. Ques. "Would he"—meaning me again—"for the same offense send a man to the penitentiary for life?" Ans. No; hardly for life; about 30 days for first offense, with liberal increase for subsequent offenses; sentence to be suspended upon promise to reform. There; that covers I believe the questions propounded by Mr. C., let me ask him a couple. Mr. C. speaks of ducks as being preserved game and tells us that a certain shooters' club had certain property rights in him, the duck. When, I ask, did the duck cease to be a migratory bird and become so permanent a resident of any place as would warrant any shooters' club claiming any property right in him, except when dead and reduced to possession? If it is not a half-way sort of robbery to take more than one's share of migratory game, what is it? The immoderate killing of even preserved game of any kind is usually an indication of brutal instincts (see some of the criticism on the inordinate slaughter of preserved game by our friends on the other side of the pond, in back numbers of FOREST AND STREAM). Another opinion of mine; backed by FOREST AND STREAM this time.

Our Quaker City friend does not believe that the pages of the papers devoted to field sports are "besmeared with the bloody records of immoderate slaughter of game." It is very evident that the gentleman only reads FOREST AND STREAM—quite commendable—which paper, as stated by me in the article to which he takes exception, very rarely offends in the killing line, but let him scan the columns of some of the so-called sportsman's magazines and tell us what he finds there. True; a large percentage of what he will find there is exaggeration, but not all of it; I only wish it was all exaggeration.

In his last communication he says, "the unwritten law of common honesty." "There is no such law." I guess Mr. C. is right. I wrote, or at least, intended to write it, "common decency;" the man who set it up made it "common honesty," he should not be condemned, my chirography is very unlike copper plate. There is, however, such a law as "the great unwritten law of common decency," we have had it here for an age and it ought to have reached Philadelphia by this time. Unwritten laws are not always found in the statute books. Hope Mr. C. will not take this last remark in too literal a sense and call me down.

All of our friend's arguments relative to property rights in game has been discussed, ad nauseam, on the pages of nearly every one of the sportsman's papers and magazines, for the past 20 years; discussed in the same manner and in almost the identical language used by him; it is, therefore, not new, neither has it the slightest bearing on the question of immoderate game killing. Because a man happens to own a small share in a piece of property it is no warrant for his taking the whole of it by any means. The game is the property of the people and he who takes more than a fair share of it does that which I believe at least 80 per cent. of our sportsmen concede to be wrong, intensely wrong, and he is a mighty dull man who in this day of enlightenment does not know that unlimited slaughter of game is wrong. To my mind the only question before the house is how to right the wrong. FOREST AND STREAM suggests one way, others have suggested another, the doctors disagree; who shall decide? All the raps I have received in this controversy came about from my having offered my individual opinion of the "immoderate killer," an item in FOREST AND STREAM pertaining thereto, and I now ask that if my position in the matter is not entirely clear, to say that I have the same liking for the wilful, persistent, game-hog that I have for a fellow who would strangle an infant, or poison a well.

As an offset to the adverse criticism on my position, noted by Mr. Childress, I wish to add that during the past 10 days I have received at least a dozen letters of commendation and endorsement, three of which were from gentlemen connected with the Museum of Natural

History and the New York Zoological Park and had I permission would send them to you for publication if you were so disposed. For myself, however, I promise that you will hear no more from me on this subject, even if called a cosine, or even that awful name "game fanatic," the antithesis I presume of "game-hog." M. SCHENCK.
New York, April 15.

Litchfield Park.

I received some time ago a letter from you asking about "Litchfield Park" for your usual report on game parks. You have in former numbers pretty well described the park. My elk are breeding and doing well. I have lost quite a number from various causes, but the remainder are looking splendidly.

I have a herd now of nearly 20 moose, all of which came from outside of the United States, some from Canada, some from Manitoba. They are doing well and will probably breed next year.

A bunch of fallow deer were put in over a year ago. I should judge that nearly half of them are dead, as we only see that percentage around. These animals require a little feeding in the winter.

Have not been able to obtain beaver as yet.

Built ten miles of first-class carriage drives last year.

EDWARD H. LITCHFIELD.

Vermont Deer in the Sugar Bush.

EAST DORSET, Vt., April 10.—The deep snow and crust on the mountain have driven a great many of the deer down into the valley during the past two or three weeks and they are seen nearly every day within a few rods of this village. Another thing I noticed a day or two ago is that they are drinking sap from buckets in the woods and it may be that in a measure which is keeping them in the valley. I saw one licking syrup off from an old milk can which had been used to carry syrup down from the woods a few days ago, so I conclude they are fond of sweets.

More partridges (ruffed grouse) are wintering in the woods about here this winter than I have seen in five or six years, so I think, if we have good weather during the hatching and breeding season, we may reasonably expect a good many birds another fall. C. W. BARTLETT.

Pheasant Stocking.

APROPOS of the *Brief's* pheasant breeding instructions, Mr. W. B. Mershon writes from East Saginaw, Mich.: "There is a good deal of interest taken by the sportsmen around here in this pheasant business. It is going to have a good effect in this way; it is going to educate the people to game protection and to prize our native birds more highly."

"We never had more quail in Saginaw county than last year. How they wintered I cannot say. It was one continual storm during March, and earlier in the winter we had five days when the thermometer ranged from 10 to 23 below, and even at noontime was not above zero. Fortunately then there was no snow on the ground."

How to Cook a Snipe.

L. D. C. asks: "What is the best way of dressing a snipe? Also of cooking them?"

Pick it (but don't draw it), and broil. Or wrap in bacon, skewer, and roast in a pot. This if one of the smaller snipe. The larger ones, pick, draw, split, add bacon and broil. Some add onion, and there's a woman down on Cape Cod who does her snipe with garlick; no matter how many birds her guests bring in, when she fixes them up they prove all too few for a Cape Cod gunning appetite. Some folks leave the trail in all snipe and woodcock.

Weights of Foxes.

Editor Forest and Stream:

My own limited experience corroborates Mr. Stark's testimony concerning weight of foxes. It so happened that the smallest and the largest foxes I ever killed were shot when I had no knife with me, and I was obliged to carry them home to skin. I improved the chance to weigh them, and the small one weighed 7lbs., the large one 12lbs. The Canada lynx weighed 17lbs.

AWAHSSOOSE.

Ontario Deer Killing in Water.

LAST week the Ontario Legislature legalized the killing of deer in water on the ground that it was inadvisable to prohibit it as long as hounding should be allowed. The great increase in the slaughter of deer, which is inevitable, may eventually result in the prohibiting of hounding. If so, the retrogressive action of the Legislature will be a good thing in the long run.—Canadian Champion, Milton, Ont.

Every Number will be Complete.

Editor Forest and Stream:

In re *Woodcraft*, you have served up a "menu" that ought to be appreciated. The stories by Mather, Robinson and Nessmuk ought to be enough to make 'em bite. I hope you make each number complete.

[Yes, every number of *Woodcraft* will be complete. There will be no "continued in our next." But certain papers in one number may be supplemented by some others in a later issue. Thus, Philip Gilbert Hamerton's chapter on "Dogs" will have as a complement in some future number Grant Allen's "The Dog's Universe." A list of the contents of the April number is given in our advertising pages.]

Mollie's Easter Hat.

I've got to kill a jaybird—a robin an' all that,
For we're goin' to economize on Mollie's Easter hat.
She's goin' to trim it up herself—them wuz her very words—
An' now, I've took the contract fer to bring her in the birds!

Now, thar's a woman sensible—don't put on any frills!
An' never tries to break a man with millinery bills!
What does she want with feathers in the shiny shops in town,
When I kin load my rifle up an' bring the feathers down!

—F. L. S. in Atlanta Constitution.

Sea and River Fishing.

The Hook and I.

EVERY fisherman has heard his well-meaning but non-fishing friends exclaim: "Oh, I haven't the patience to fish!" as though that was all that went to make up a fisherman. Usually you smile or murmur vaguely that everything comes to him who waits, but now and then someone will come over the well-worn phrase on whom you can pour out your phials of wrath in telling him that he also lacks skill, energy, brains, and the gift. Patience, with them means a rod, a body of water, and hours of time, and frequent repetitions of the dose. Patience, indeed! Why, some of the most successful fishers I have ever been with have made the air quite blue around them with the fervency of their remarks when flies were missed, leaders breaking, rods a-smashing! I have seen a fouled reel cause an ardent fisherman to show what patience was in his make-up.

I am afraid we are misunderstood and the noble art of angling not appreciated. One time an elderly minister of great scholarly attainments was preaching the baccalaureate sermon at the commencement of a young ladies' seminary. His subject led him to speak of the art, and he called it "the peaceful and unexciting pursuit of angling." What think you of that? You who have had the black bass jumping, "crazy for the fly."

The fisherman knows hopes, fears, longings and triumphs that come not to ordinary mortals, and they are as dear and as slow to be relinquished as the dreams of an opium eater. But how different in the effect on body and mind—the difference of life and death. Fishing never kept a man down. Look for proof at the number of noted men who have been fond of fishing, and when a great man fishes at all he fishes to perfection.

Boys are fishermen ex officio, but they do not take it seriously. When they grow up it is only a small percentage that go to fishing in earnest. Of all my boy friends I believe that I am the only one who cares to fish, and I often think of the very first fish I ever caught and wonder if there was any foreshadowing of my fate in the circumstance.

There were five boys whose ages ranged from five to seven, and we very carefully set our fishing poles at the root of a big cottonwood tree and went away to play. When we returned we found that a big sucker had been caught and that he had roamed around among the different lines until they were wound into one. We landed the big fish, as long as any of our arms, nor stood upon the order of landing. A man came by and a season of breathless suspense ensued while he was tracing the sucker. When the lines were untangled the sucker was found to be on my line, and I ran home with it in my arms. I am the only one of that hopeful group who casts a line in the water to-day.

Maybe circumstance has most to do with making a man a fisher, even as the taste of mutton makes a sheep-killing dog out of a nonentity. But not all. There may have been many a man who from want of chance has lived and died without knowing his capabilities as a fisher, or what life held for him. "Some mute, inglorious Milton" whose lot forbade.

I think all fishermen are proud of their proficiency in the craft, and look down somewhat on those who do fish as well as they. They may not brag about it, after the manner of me, but in their inmost souls they respect not the frantic efforts of a superior in most things in his endeavor to whip out a line length of his rod. I have been with gray-haired men who had made a success of life and to whom I must have deferred in all things else, for whom I had a kind of a contempt, of which I was ashamed, when fishing with them, for the unskillful way in which they handled themselves in their futile endeavors to extract fish from the water. It probably never occurred to such a man that there was any special reason he should be expected to fish well.

I once fished with a gentleman who had never realized that there was any particular sleight in the art of angling. We were just established in a camp in the woods at the forks of an ideal trout stream. The north fork came down with that clear amber color which water gets by flowing through spruce woods, and the south fork slightly discolored by the mud it drained from a bog. This mud is deposited in twelve or fifteen miles, and the whole stream becomes again as clear as crystal. There was a gentleman in the party, a wholesale merchant, who was paired with me for the south fork. His rod and accoutrements looked suspiciously new, but it was not until he respectfully asked me to put a worm on the hook that I knew he was new to the business. We started up the south fork, a stream about 20 ft. broad, and I let him go ahead—the most pronounced act of self-denial that the trout-fisher knows. He did not care to lead the way, and telling him the proper distance to keep behind me I had the glory of casting in the stream the first line that had been cast maybe in months.

About the time we separated C. stepped on a smooth stone and fell down on his back in the ice-cold water. He tried to make a few remarks on the mishap and the contractions of his throat were awful. I advised him to set his teeth together and not try to explain how it happened for fifteen minutes or so, and his remarks would be more connected. This is the only way to hide all signs of the effect a sudden ducking has on a man.

Having saved my manners and secured the place ahead, we gradually worked our way up the stream, casting a fly in the likely places and taking a trout too frequently, for my number would soon be reached, there being several other fishermen out.

At a bend in the stream where some big boulders marked a geological change in the face of the country, when standing on a large rock, I had a rise from a big trout and I tried for some minutes to get him to change his mind about rejecting the fly, but to no purpose. C. overtook me, and clambered over the boulders near me. Just then his feet slipped and he sat down very violently on a big stone and a crash followed. Now most of regulated families and camps have a small supply of some stimulant on hand in case of accident, but it is an unwritten law in our camp that no one is to carry a bottle with him after the manner of that small supply in a

pocket flask vulgarly called a "tickler," and also that it is to be used in moderation. Anyone so far forgetting himself as to attempt to celebrate the first founding of the forest, or for other seemingly good reasons, has the pleasure as well as the privilege of contributing the sum of \$5 and upwards, which is applied to the reduction of the sum total of the expense fund.

C. being on his first trip was excusable for not knowing of this rule. His tickler was an elaborate leather-bound flask, the property of the captain of the gang, to whom it had been presented by someone he thought a lot of. He prized it very highly. Therefore, when C. put it in his hip pocket and sat down very hard it gave way, and great was the catastrophe. The flask was ruined, to say nothing of spr. fru.

Continuing up the stream, saving the adults and casting back the infants into the water to grow bigger, we worked our way up the stream. The overhanging boughs made casting difficult, and C.'s remarks when his line became entangled in a tree for the twentieth time were very edifying.

About a mile or so up I found that I had upwards of thirty-five trout in the basket, all that it was given me to catch. The uninitiated might argue that trout being plenty, they could be caught and put back, as they were so plentiful. I am not that kind of a fisherman. There has to be a chance of acquiring to make pleasure for me in the complex sport of fishing. I dreamed of the delights of catching a tarpon until someone told me the fish was no better than carrion when caught. Since then I have not hankered after such sport.

C. and I sat down on a flat rock in the middle of the stream and he looked at the fish. He had not been able to secure one, little or big. We sat there talking and becoming acquainted. He gave me the first idea of his powers as raconteur, for as such he is unsurpassed. It was his graphic description later of my enthusiastic remarks in landing a big fish that leads me to retaliate in a slight degree. There we sat, I with my rod in my hand, with the line and leader gathered in an orderly manner. C. sat with the water washing around his feet, with his back down stream. His rod was on his shoulder and the line trailing down stream. The bait was a fat fishing worm, which the strength of the current kept on top of the water. C. was telling a rollicking Irish story when a good-sized trout took the bait and gave the rod a wrench. C. jumped up and very coolly led it in and remarked: "That was easy!"

Since then, when, after toiling with the rod and line for hours, and there seems to be nothing in the waters under the earth, a fish takes the lure in the twinkling of an eye and is taken in turn, I lose sight of all the labor of the hours which brought me nothing and think how easy it is to catch fish.

MARLINTON, W. Va.

ANDREW PRICE.

New England Angling.

BOSTON, April 15.—Mr. H. F. Hathaway is a Somerville trout fisherman of considerable reputation; that is, a reputation of always getting some. Saturday, April 1, he was early on a brook in Concord that he has the acquaintance of, and brought back to Boston seven fine trout. The next Saturday evening his friend Jackson, also a fisherman, met him at whist and inquired if he had secured any trout that day. He explained that he had taken several; one of 10 in. in length and two of 12 in. Fishing down on the Cape has generally been disappointing, the sportsmen returning without any or with three or four. But Mr. Luther Little, an enthusiast concerning Cape fishing, with Dr. — (he stipulates that his name must not be mentioned, since it injures his practice for his patients to know that he goes a fishing), and Dr. Richardson have fished one or two Saturdays at a pond they own in Centerville. The first Saturday brought them 36 good trout. The next Saturday Mr. Little got seven trout, one weighing 1½ lbs. Grover Cleveland and A. C. Benedict, of New York, have come around for the spring fishing on the yacht Oneida. At Buzzard's Bay they were joined by A. H. Wood, of Boston. At first they fished Nine Mile Pond, near Centerville, which they own, and later went down to the Cape to some waters near Sandwich. The amount of their catches is not generally known, though reported to have been good.

Mr. L. Dana Chapman, secretary and treasurer of the Megantic Club, made his annual report to the directors last Tuesday. The condition of the club financially is excellent. Payment and discharge of the mortgage on the club's property has been made. Payment of all notes payable and outstanding bills, with accrued interest to date, has been made. Bonds which would regularly have been paid in August next have been taken up. Every dollar of outstanding indebtedness incurred for supplies purchased for the coming summer, has been paid, and a comfortable balance stands to the credit of the club. Six gentlemen have just been proposed for membership. The directors have voted to purchase several new boats and canoes. At the opening of the season the members will find everything in first-class shape. The season is unusually late, the woods still being full of snow and the lakes ice-bound. The report in the papers about the slaughter of deer on the club's reserve is entirely unfounded. That such slaughter has been carried on is doubtless true, but it has been done many miles north of or east of the Megantic. Mr. Chapman is well satisfied that the deer have been let alone on the lands of the club, since the close season begun.

April 17.—There is little that is new about the ice that still locks most of the New England fishing waters. The Penobscot has just opened up to Bangor; two or three weeks late. No salmon are yet reported to have been taken by anglers at the Pool, though they are tried for every day. The Kennebec opened up to Waterville late last week; fully three weeks behind last year. Sebago Lake is not yet open, and is now 11 days behind last year. The fishermen here, of the Sebago Club, are entirely discouraged about visiting their camp on the 10th; reports Saturday stating that the ice is still solid. Mr. H. Staples Potter has just returned from a fishing and outing trip of several weeks in Florida waters. He made his headquarters at Punta Gorda, sailing in a yacht into different fishing waters. He reports that the tarpon have been very late about coming in this year; though he succeeded in getting two; one weighing 18 lbs. These gave

him all the sport he could desire. Other fishing was fine, in many varieties. Mr. Dean, well known for his tarpon record, was there, but also found the tarpon late. Some of the fishermen here are planning for brooks in New Hampshire on the 19th, which is Patriots' Day in this state, a legal holiday. Saturday tackle was being looked over and put in order. Several sportsmen, with rods and reels in hand, left for the Cape on the morning trains. L. T. Smith mentions taking 20 good trout in private waters on the Cape one day last week. These owners of private waters do not like to mention their successes; it gives away too much to the local poachers. Lake Webb, Weld, Me., Fish and Game Association, held its annual meeting Saturday evening, April 8, and elected the following board of directors: E. W. Pratt, R. E. Scamman, J. A. Witham, A. M. Child, H. A. Coburn, H. M. Barrett, C. G. Dummer, F. S. Schofield and R. G. Dummer. The directors were to have a business meeting Saturday evening, April 15.

SPECIAL.

In the Pound-Net.

BY FRED MATHER.

THE trout season on Long Island has been dull so far. It opened on March 29, and will open in the rest of the State of New York on the 16th. The weather has been raw, rain fog and east wind, conditions favorable for bringing on rheumatism, but not calculated to awake the appetite of a trout. A few trout were taken on Long Island by those who will fish on the opening day if they do not wet a line again all summer. They remind one of the "first-nighters" at a New York theatre. There are probably two thousand persons in New York City who never visit a theatre except on the first night of the presentation of a new play, and they are disconsolate when two new plays are presented on the same night. Their faces are familiar at the box offices, and they know each other by sight; they have one trait in common and that is all. There are such anglers, in New York City, at least, and it is their boast that they have not missed an opening day in a certain number of years, and they can tell you how the weather was on the opening day a dozen years ago, who fished and what the catch was.

This is simply a fad, like the first-night theatre fad, the collection of postage stamps or knot-holes. It is not a legitimate subject for ridicule, because some of us do not care for that sort of thing. Some twenty years ago more or less, the law for long Island trout opened on March 1, and I have known men to go there and fish in the teeth of a howling gale, when their lines were coated with ice, and they were clad in ulsters. If a man considers this to be sport, who shall say him nay? Men have pursued the musk-ox and the barren ground caribou into the Arctic circle, where they could barely find food for their dogs, on which their lives depended, and suffered hunger to the point of starvation, and called it sport. Some of them wrote books of their adventures, but a book would not compensate for the suffering; there was the dare-devil spirit of the Vikings behind it all, and perhaps this spirit, in a lesser degree, animates the trout fisher who disdains all discomforts.

Men not only look at things differently, but the same man will view them in different lights as he gets older, and therefore we should let every fellow seek his pleasure in his own way, within legal bounds. Forty years ago the question of physical discomfort; to me, was not a factor in any proposed sport; to-day it is the prime one. Then, to tote 50 lbs. of venison and a 10 lb. rifle for ten miles, with clothing wet through and frozen on the outside, was a mere incident that enhanced the sport; to-day the game would not be worth the ice, and both venison and rifle would be thrown away and never be regretted. Fifty years ago I stripped and swam through floating ice about 100 yds for a mallard, and was in the icy water nearly half an hour; but I got my duck and thought nothing of it then. To-day that bird would represent half a dollar; then it was invaluable, and I would risk life for it, although the risk was not thought of. To-day such an exposure, if I would make it, would end up with muffled drums and "three rounds blank."

As the melancholy Jacques says:

"And so from hour to hour we ripe and ripe,
And then from hour to hour we rot and rot;
And thereby hangs a tale."

Buying Fish to Take Home.

We are built on different lines. This is not stated as a new or a startling proposition, because men have become familiar with this fact in centuries long ago. They have also observed that the same rule which governs men may also be applied to wives. As one who has had much experience in angling, as well as in other departments of life, let me say to young anglers, tell all the fishing yarns you can invent at the club or to the sitters around the country grocery, but be dead square with your wife. If you have that false idea that it is disgraceful to come home without a fish after a day's angling, banish it and tell the truth. Many of us have fished with success varying from a grand catch to little or nothing. There is nothing to be ashamed of in coming home empty-handed; many hunters of big and small game do it.

We have all done it since the days of St. Peter, who said: "We have toiled all night and caught nothing."

This had just been written when in came my neighbor, Mr. P. C. Macevoy, with a story of a man who had been fishing and caught nothing, but was disposed to deceive his wife by buying some fish on his way home. It was not an unusual case, but his story moved me to put it in rhyme, and here it is; it seems best to call it

An Angler's Pipes.

The angler hastened toward the brook,
As the brown thrush piped its lay.
He sorted his flies of gaudy dyes,
And guessed what his creel would weigh.

His flies fell light on the waters bright,
While a robin piped a tune;
But none of his flies could coax a rise,
And the sun was marking noon.

So he dropt his reel in the empty creel,
And sadly piped his eye;

Then, as he thought where fish could be bought,
His whistle replaced the sigh.

"Oh, Molly," said he, "If you could but see";
(And Molly was piping him off),
"How the trout would rise at the poorest flies";
The rest was lost in a cough.

"Yes, dear," said she, "now give them to me";
(John started to fill his pipe).

"Why these aren't trout!" so Molly did shout,
"And, darling, they're rather ripe."

After reading these verses to Macevoy, he mumbled:
"Um—um—piped his eye; it's all right, but what do
you mean by that?"

"Mac, my boy, if you were familiar with that old
English punster, Tom Hood, who wrote,—

"He went and told the sexton
And the sexton tolled the bell."

"You would also remember his equally good pun of

"First the bo's'n eyed his pipe
And then he piped his eye."

"Which in nautical lingo signifies weeping." But Mac-
evoy could stand no more of this and had gone before
the sentence was finished. He knows a good thing when
he sees it, but he did not have his glasses with him.

Puns.

Quoting from Tom Hood, the great English punster,
brings up that statement, made by somebody, that "a
pun is the lowest form of wit," and the reply of some
other somebody, "Therefore it is the foundation of all
wit." Our American punster, John G. Saxe, proved this
to the satisfaction of some of us, but space forbids quo-
tations. Here are two things which may not be puns,
but if not they may be put under the head of tautology.
The first has no relation to fish, but the second one has,
and so they are given.

Once some fellow wrote on the correct repetition of
words, and chose the word "that," saying: "I say that
that 'that' that that man used was superfluous." This
was pasted in my scrap-book and under it I wrote: "He
has five words in his string, but I can go him three bet-
ter in this line: 'Of all the smelts that I ever smelt, I
never smelt a smelt that smelt as that smelt smelt.'" Not
the same word in consecutive repetition, but 'twill pass
in a crowd. As the systematic name of the smelt is
Osmerus, which, if Prof. Jordan's Greek is correct, means
odorless, then I can imagine some learned ichthyic duf-
fer paraphrasing this thus: "Of all the osmerus that ever
I osmered," etc.

To me a bit of nonsense, either to read or write it, is
a safety-valve—it takes a man outside his self and breaks
up the bad habit of continuous thought. Someone
wrote:

"With curious art the brain, too finely wrought,
Preys on itself, and is destroyed by thought."

This is from the scrap-book before mentioned, where
wit and wisdom jostle each other. There may be minds
which do not need relaxation, but the little one which I
lug around, can stand any given quantity of it. The
mad-houses are filled with people who never relaxed the
bowstring of thought. "No, no, that way madness lies."

The Antiquity of Fly-Fishing.

It is a singular fact that the modern Egyptians are
ignorant of fly-fishing; at least Wilkinson tells us so in
his "Egypt"; yet paintings show that it was practiced
among the Egyptian gentry as far back as the days of
the Ptolomies. The ruined cities of Thebes and Beni
Hassan abound in pictures of fishing, some with the
fly and others with the spear. Among the remains of an-
cient Nimroud, which is the modern name of the Assy-
rian city of Calah, on the east side of the Tigris, a few
miles above the mouth of the upper Zab, there is a paint-
ing of an angler with his rod in hand, fish by his side,
and near his feet is a creel said to be of willow and ex-
actly the same as those we sling on our shoulders to
carry our fish in to-day.

Verily, there is little that is new under the sun, unless
it may be the X-rays and wireless telegraphy, and there
is no telling but what some Egyptologist may dig these
things from under the pyramids.

We know from the paintings that the Egyptians fa-
vored the trident spear, throwing it from the bank of
canal or river, or in a boat of papyrus, but it is not gen-
erally known that they used the artificial fly.

Just how long the Japanese have been fly-fishers is a
question. I have some wonderfully delicate flies from
Japan, the tiniest midgets, that danced in a cloud before
your face on a spring day, tied on the most minute of
hooks with a snell of horse-hair.

Midges.

The above paragraph brings up the question of these
dancing midges. I don't know what they are; no man
knows. Of course they are catalogued by some bugolo-
gist and given a double-jointed name twenty times longer
than they are, but when you have that all tucked away
under your hat you are no wiser.

The snow is hardly off before there are bunches of
these things; they gather in bunches of a bushel or so,
and play tag in a nuptial sort of way, and in a few days
they are no more. With them it's a short life and a merry
one; eggs are laid in or about the spring water, and so
the round goes on.

The particular midges here referred to are not the
biting "no-see-ums," black flies or other pests. They
play in the sun for a few days in early spring, procreate
and die. The curious thing about them is that they will
accompany a man, keeping about his head and dancing
in front of his face and yet have no bloodthirsty designs
on him. The larva of one of these gnats, for no doubt
there are others, may be found on the crest of a dam in
the swiftest of water; a small worm with a hard head,
and if detached will spin a thread and work back by it.
Later it makes a pupa case on the dam. Any trout
cultivist can find it in summer, and years ago a man
given to sensation, a sort of "yellow" fishcultivist, made
the startling announcement that there was a "web worm,"
which spun a web to catch trout. It merely spins a
single thread, which enables it to get back to a place of

safety, for no fish can get it where the waters are pouring
over a dam, and as long as it can maintain its position
there it is safe.

Curiosities in the Tackle Shops.

Every dealer in fishing tackle is compelled to keep a
lot of freak things, and they are queerer than the wood,
bone and iron hooks of the Eskimos. Last summer I
fished for striped bass with the late Jeremiah Sullivan, on
the north shore of Long Island Sound, from New
Rochelle some ten miles east. We had a boatman and
the best of sand and blood worms; fished all day and
never caught a fish. Yet it was a grand day. Jerry had
grown up in the tackle business from the store of the
original Conroy, in Fulton street, and had fished with
Genio C. Scott, of the elder lot of anglers, and was a
frequent companion of Mr. G. P. Morisini, one of the
best of striped bass anglers about New York to-day. Few
were the New York City anglers who did not know
honest "Jerry" Sullivan, who died a few weeks ago, hav-
ing been eighteen years with Conroy.

As the boatman rowed along over ground where many
good bass had been taken a few days before, and were
taken a few days afterward, I said: "Jerry, I've plugged
along with such tackle as I have been accustomed to use
for different fishes, but often wonder at things which I
see in the showcases. Those artificial mice, rubber frogs,
dobsons, and, most of all, rubber angleworms. Do they
really catch fish?"

"O, yes, suckers," and he reeled in to clear his hook of
weeds. Then he added: "Pardon me; I thought I had
a strike, and will modify my statement by saying that
there is a demand for these things; other firms keep
them, and we must. It is possible that the rubber mice
and frogs may be more or less effective, because they are
put in motion; but no fish would touch a rubber worm or
a dobson, because they don't smell right."

"Then you think a fish is prompted to take a bait
more by smell than sight?"

Jerry replaced some blood worms which the weeds had
torn off, and then replied: "Not a surface lure, like a
fly or a spoon, where the motion attracts the fish, but
when a man is still-fishing with bait it would be a fool
fish which would take a bit of rubber for a worm. Boys
are attracted by these things; old boys, too, who know
no better, and I sell them unless they should ask if they
are good, when I tell them the truth."

"Then you do not offer advice."

"Never; I might get a rebuke if I did. If a person
asks for an article, it is fair to suppose that he knows
what he wants; but if he thinks that I may know more
of the use of some fancy article than he does, and asks
for an opinion on it, he gets it. The tackle stores keep
lots of fancy things, got up like Peter Pindar's razors, to
sell. Things that an angler of experience would only
look at as curiosities, just as he would regard strange
coins which represent no value to him."

I was gradually leading Jerry to two things, about
which I had curiosity. While the average angler has
his own notions of things and gets the ideas of the few
friends that he fishes with, his field of observation is
small compared to that of a man who sells fishing tackle
and talks with a hundred or more men each day, experi-
enced anglers with differing views concerning some de-
tails of their tackle; old fishing cranks who want some-
thing different from anything on the market; young fish-
ing cranks who once fished with some guide in the wil-
derness and who know more about fishing tackle than the
veteran angler or dealer, and the honest man, who
knows about what he wants, but realizes that he has not
had much experience and asks advice of the merchant.

Automatic Reels.

With all this in mind the talk had been led to the
point where I asked: "What is your opinion of auto-
matic reels? There are several on the market, and I
only refer to the principle on which they work, and not
to any maker. Do they sell well?"

"Confound these blood worms; that one bit me; they're
getting scarce, and we will have to use more sand worms.
O, yes; you asked a question. Well, the salt-water
anglers won't use them; a few are sold to trout fisher-
men about New York, but they are more popular inland.
You saw the trout reel I used last spring; that tells what
kind of a reel I prefer. What is your opinion?"

This was a natural, if unexpected, question, and was
answered thus: "Like you, I find these reels more popu-
lar in central New York than elsewhere; some anglers
swear by them—good anglers, too—but, Jerry, there are
things about them that prohibit their use on my rod.
They are constructed on the principle of the Hartshorn
window-shade roller—the more line you reel off the
stronger the spring acts, and the more you reel in the
weaker the spring. This is all right on a window-shade,
where a few feet is the limit of its work, but 60ft of line
is another thing. Then, my boy, it is silent. About
half the enjoyment of trout or bass fishing is the song of
the reel, simulating the exultant chirr of the kingfisher
after a dive of more or less success; a reel without a click
has no charm for me."

Jerry was evidently annoyed; he had invited me to his
favorite grounds for striped bass and the day was blank.
Perspiration was on his forehead, but I laughed at our
non-success and told him that next year, when he should
be my guest on the same day and grounds, there might
be no fish taken, but there was a hope that the outing
would be as agreeable as that of to-day.

He said: "Your first objection is a sound one; the
spring weakens as it reels in and there is no such thing
as the 'escapement' of a watch to regulate this; and if
one should be invented, there would still be your second
objection, which is entirely sentimental. Izaak Walton
never knew a click reel; he enjoyed fishing, as we read.
Why do you demand a click on your trout and bass reel
and not on the multiplier that you are to-day using for
striped bass?"

The question was superfluous, for no man knew bet-
ter than "Jerry" Sullivan that a "click" is not only a
check on a fast running line, but also indicates the
speed at which the line is running. He also knew that
the "song of the reel" is the sweetest of all songs to the
angler. But he was answered on these lines, and when
he turned and put a question which unexpectedly put me
on the defensive, I replied: "You will not deny, Jerry,

that we fish for sport. As boys we found our greatest
sport in using hand-lines and pulling in fish hand-under-
hand. Then came the use of rods and reels and the wind-
ing in of fighting fish. To me, the enjoyment of trout
fishing is the reeling in, on a click reel, of a fighting trout,
and as for a spring on my rod taking in this trout, why,
I'd as soon signal to a steam engine on the bank to
pull it in. I want to feel every bit of tremulo on both
hands; the exquisite throbbing of the rod and its elec-
tric effect on the crank of the reel, as well as hearing its
song."

Poor Jerry! He had laid out to give me a grand day's
fishing and had failed so far as fish were concerned. All
sportsmen have had such experiences if they have lived
long. They know of good grounds for fish or game,
where they often have fine sport, but it's ten to one that
the day is blank when they write a friend to fish or shoot
with them.

About Rods.

"Jerry," said I, "there are rods that I would not have
found among my effects when I leave earthly waters to
try those of the Styx; and if we are to use the ghosts of
our departed rods on those misty shores, it is sure that
none of the rat-traps will be seen in our hands by the
shades of angling friends gone before."

Jerry looked up and remarked: "In the natural course
of things you should be there to greet me, but nothing
is more uncertain. If you refer to split bamboo rods in
the department stores at 99 cents, a sum that would not
cover the cost of the ferules on a good rod, it is safe to
say that we will not be ashamed to have all the anglers
from Izaak Walton down to a Jamaica Bay flounder
fisherman inspect our rods."

The "natural course of things" did not work out in this
case, and Jerry died last month of acute pneumonia. He
had a wealth of anecdote of the older New York anglers,
whom he knew as a boy, and many of whom he fished
with. Once I asked the late Genio C. Scott, author of
"Fishing in American Waters," now out of print, about
the proper style of hook for taking lake trout, and he
replied: "There is a hook made for those fish which is
long in the bend but short in the point; but you had
better go and consult Jerry Sullivan."

Auf Wiedersehen.

An old song says: "Say au revoir, but not good-
bye," and an older ballad tells in the most doleful of
metres:

"Farewell, farewell, is a lonesome sound
And is oftimes heard with a sigh;
But give to me that good old word
That comes from the heart, 'good-bye.'"

The time has come for me to say something of this
kind, but there is nothing in the French "au revoir" or
the English "good-bye," which is a corruption of "God
be with you," which appeals to me like the German "un-
til we meet again."

There had been a sort of a dream that I should go to
take charge of a great trout preserve in Wisconsin. The
dream spread out over two years, as dreams always
spread, and then somehow it narrowed down to a date.
The date was somewhere in the coming June—and things
were getting brisk, with some April lectures and a new
fishcultural book to see through the press; but, when a
telegram came with orders to start on April 15, there was
no margin. Therefore, all correspondents are hereby
notified that my personal address for one year—the con-
tract is for one year only—will be Brule, Douglas county,
Wis.

This place is in a wilderness where bears, deer, wild-
cats, sharp-tailed grouse and other beasts may polish my
bones, but I will go and face the sharp tails of the
grouse, and between dropping a line to the trout may
drop a few lines to FOREST AND STREAM. So—auf
wiedersehen. FRED MATHER.

Old Shad Times in Connecticut.

ALLUSION is frequently made at this season, when Shad
begin to run in the Connecticut River, to the time when
shad were so abundant there as to sell for a penny
apiece. In the New York Herald of April 9 the writer
was quoted in regard to some historical reminiscences and
data which he published some years ago. The same were
obtained, I may say, by laborious investigation of public
documents during a summer sojourn at Old Hadley, in
the Connecticut River Valley, and are in all respects
authentic and official. One of the most voluminous of
these references is Sylvester Judge's sketch of Old Had-
ley, which is available at the local libraries at Hadley and
Northampton. I am surprised, therefore, to read in the
FOREST AND STREAM of April 13 that "no authentic data
exist," and to note the intimation that these old state-
ments regarding the glut of salmon, shad and canvas-
back ducks, are so nearly obsolete as to come within the
realm of myths. CHARLES HALLOCK.

[The gluts of salmon and shad and ducks are not
mythical; but did the fish or the fowl figure in apprentices'
indentures as articles of food from which for certain stipu-
lated days they were to have relief?]

Jeremiah Sullivan.

THE late Jeremiah Sullivan, for many years associated
with Mr. T. J. Conroy in the fishing tackle business in
New York, had been with Mr. Conroy for eighteen years,
during which time he made many friends among the
anglers of New York who had dealings with him, and all
will be grieved to learn of his death. Mr. Sullivan was
thirty-eight years old, and up to the time of his illness
was in perfect health, and frequently found time to leave
his business for a few days' fishing with some of the local
salt-water fishermen, among whom he was particularly
well known and respected.

"Children Together."

Forest and Stream Pub. Co.:

Dear Sir—Find enclosed 25 cents for one copy of "Game Laws in
Brief and Woodcraft Magazine," to be sent to the following ad-
dress. We can't get along without FOREST AND STREAM. We
were children together, and I am only four years the older; but
my brother took it, and our mother read aloud the stories after
we were in bed. How well I remember one evening she came
across the word "cuss," and the little lecture we got; but she kept
reading just the same. J. T. D.

Fishes of Hudson Bay and Strait.

BY CHARLES HALLOCK

IN 1884 Mr. Charles R. Tuttle was historian of the Canadian Government expedition sent to Hudson Bay and Strait to determine the period of open navigation, as bearing upon the question of the proposed Hudson Bay route. In his published record he devotes considerable space to the economic fishes of those waters, and after stating that cod swarm in Ungara Bay and all along the north Labrador coast in quantities so vast that a schooner may be loaded in a few days in any of the inlets, he remarks that, if any person wishes to see *Salmo salar* in perfection, "he should go to the rivers and brooks and torrents and leaping, dashing, foaming streams which everywhere empty their turbulent waters into Hudson Strait. * * * There dwell the salmon in their virgin beauty." They abound in such numbers that a ship can be loaded with them in a few days; and even at the date named, which was fifteen years ago, the Hudson Bay Company maintained a fishery at Ungara Bay and shipped a refrigerator steamship load every year to the old country. This information will astonish those who imagine the shores of that Arctic channel to be only a tenantless terra incognita.

Sea trout are even more plentiful than the salmon, and nearly as large up there, being a little longer, but no quite so stout, according to Tuttle. By some ichthyologists they are designated as spotted salmon, or Hearne's salmon, and Dr. Robt. Bell, chief of the Dominion Survey, speaks of them as Hearne's salmon in a private letter to the writer under date of March 26, 1890. He says: "They do not go over 10 lbs. weight, but are the perfection of all salmon for flavor." This weight would be marvellous to fishermen on the Bay Chaleur and River St. Lawrence tributaries, where the average is perhaps 4 lbs. In many places the Hudson's Bay Company carry on extensive sea trout fisheries by means of simple traps, which they set in the shallow streams when the tide rises some 10 or 12 ft. At ebb tide thousands are found secured in these nets. They are salted in casks or barrels and shipped to England. The Eskimos spear them in spring and early summer, and consider them a great luxury.

Salmo salar are abundant in the Koksak and Georges rivers, and in all affluents of Ungara Bay, and thence down along the whole Labrador coast. But to the westward of Ungara it is replaced by the Hearne's salmon, which occurs all around the Hudson Bay proper and along the south side of Hudson Strait to Bay of Hope's Advance, but not in James Bay, which is a southward projection of Hudson Bay.

Still another species, the Arctic salmon, begins at a point on the mainland of the continent about Wager Inlet. The same is found in the Coppermine, Baele's River and Great Fish River. They are netted around Melville Peninsula and westward, and it is said also on the shores of Baffin Land, which is an archipelago of islands.

On the Pacific Coast this Arctic salmon is in its turn replaced by the five recognized species of *oncorhynchus*, which occur from Kotzebue Sound southward.

A species of salmon allied to the whitefish is the *inconnu* of the Mackenzie River, but a sorry fish it is for eating, or for any other purpose whatever.

Dr. Bell says that nothing worth mentioning has ever been published regarding the fishes of Hudson Bay, though a considerable porpoise and walrus fishery is carried on around Marble Island, at the mouth of the bay, and the oil product is rendered at Fort Churchill, at its head, where there are also three refineries.

A Late Season.

QUEBEC, April 14.—The angler in Canada requires a good stock of patience this spring—if one can call it spring with 8 ft. of snow piled by the roadsides and 2 ft. on the level. Not even the oldest inhabitant can remember to have seen so much snow upon the ground here in the middle of April as there is at the present time. Last year at this season the dust was flying upon even the country roads in the vicinity of Quebec. So it was at Roberval, upon the shores of Lake St. John. Now the ice is thick upon the lake, and the snow in the surrounding country is as deep as it is in the environs of Quebec. This will furnish some idea of how late the fishing season is likely to open this year in this part of Canada. Last year was an exceptionally early season, and yet on either the 1st or 2d of May both General Henry, U. S. Consul here, and the writer, whipped Lake Beauport diligently without obtaining a rise, and fished some of the Bernard Club lakes in Maskinonge county a week later with not much better success so far as the fly-fishing was concerned. Of course, the snow and ice will disappear very quickly when the really warm weather sets in, but good fishing must now be very late, for all the lakes and streams will be exceptionally high, and heavy floods are anticipated in most parts of Canada. The abundance of snow-water running down, for sometime after the thaw, is practically over, will naturally deter the trout from surface feeding until still later in the season, when the water in the streams and lakes reaches its normal mid-May temperature. I have several inquiries from friends in the United States respecting spring fishing, but it is naturally impossible at present, with the ground covered with snow, and ice still on all the lakes, to offer any definite advice. I am certainly under the impression, for reasons already given, that there will not be much May fishing with the fly, this season in the Lake St. John country, certainly not before the last week of the month. But as the season progresses and the thaw advances, I will endeavor to keep the readers of FOREST AND STREAM thoroughly posted, for nobody in Canada would like to see American anglers in search of sport, coming here at the wrong time for it. At present it looks as if the best of Canadian spring angling will be had this year in the month of June. Ouananiche fishing in the Grand Discharge will scarcely be at its best until the latter half of the month, for the late thaw and abundance of snow still in the woods will raise Lake St. John in May to much more than its ordinary spring level, and the fishing is never good in the Grand Discharge until the water in the lake has fallen to a lower level. But it is likely that for three

weeks or a month prior to the opening of the season in the Discharge, ouananiche will be taken freely in Lake St. John, almost as early, in fact, as fontinalis furnishes sport for fly-fishermen in the various streams and lakes between Quebec and Lake St. John.

E. T. D. CHAMBERS.

Hints and Points.

SALEM, Mass., April 4.—We readers of FOREST AND STREAM have from time to time come into possession of valuable information which ought to be imparted to all the brotherhood of sportsmen. In particular we know of certain valuable remedies for sickness and wounds, snake bites, etc. For instance, a friend of mine was bitten by a rattlesnake, and having learned that alum taken internally was a sure cure, he procured some a few moments after having been bitten by the snake, and although he became unconscious for a time, yet he shortly recovered. I had an opportunity to test a peculiar remedy for scalds and burns. While camping in the woods of Maine and suffering from a severe scalded hand and having nothing better to apply, I used some black-fly ointment, which gave almost instant relief. Since that time it has been used in very many cases, and found to be, without any doubt, the surest and most reliable remedy for burns ever tried. I enclose a recipe for this which has just been discovered in an old diary.

Remedy for Black Flies.

One-half ounce oil of tar; 1½ drs. oil of clove; ½ oz. oil of pennyroyal; 1½ oz. spirits of camphor; 2 drs. of ammonia water; 1 oz. castor oil; olive oil enough to make the whole quantity 8 oz.

I trust that some interest may be awakened on these lines among the readers of FOREST AND STREAM, and that others may be prompted to give other hints and wrinkles and receipts.

N. C. LOCKE.

New Jersey Coast Fishing.

ASBURY PARK, N. J., April 14.—But little success has attended the efforts of anglers in this section so far as salt water fishing is concerned. A few ling have been taken from the piers and some flounders from the tidal streams. Perch are beginning to make their presence known in the head-waters of the Manasquan and are ever welcome to the enthusiastic. First-class sport can be had with fly rod when they are taking the hook freely. The sucker seems to be more than usually abundant in several streams and is now taking the hook in his usual clumsy manner. Nevertheless he is ever welcome to a large contingent, as his memory is linked with reviews of pleasant wanderings through meadow and glen.

But little has been done along the trout streams, as the very backward weather has kept the sport in abeyance, and those who have ventured have met with but meagre success. Dr. H. S. Kimmonth has been out twice, and while meeting with some success each time, reports the streams in bad condition and the fish unusually small in size. Parties living in the immediate vicinity of the waters say that great quantities of trout perished during the past winter, owing presumably to the severity of the weather and the very shallow streams.

Dog Sense.

STILLWATER, N. Y., March 28.—Editor Forest and Stream: Fred Mather is all right. I glory in his spunk. When he maintains that animals have reasoning power, I think he knows where he stands, as his several illustrations in your issue of Feb. 25 plainly show.

It puzzles me that one can give a dog no more credit for his thoughtfulness than if he were a piece of machinery.

For instance, take three pups all from the same litter and admit that all are endowed with the same degree of instinct. One year later there will be one of them that you will prize higher than the rest. Why? Simply because he is the smarter of the three. Did instinct develop in him more than in the other two?

I have an Irish setter that I frequently keep chained under a shed near the house. One day a neighbor left two eggs lying in a wheelbarrow within reach of the dog. Upon the man's return the dog, expecting to be patted, perhaps, put his feet on the barrow, overturning it and breaking the eggs, after which he proceeded to lap them up.

A few days after that, when he was unchained, I saw him coming from that neighbor's hencoop, with an egg in his mouth. When he saw me he crouched low in the grass and carefully let the egg roll to the ground. He had never been punished for anything of the kind, yet how did he know that he was doing wrong; and why was he so careful not to break the egg? If that had been a bone or a ball his teeth prints would have been left in it.

I think that he remembered how those eggs broke on falling from the barrow, and he thought his punishment would be mitigated if he gave up the stolen property unbroken.

I will think until it is disproven that instinct is the mother of knowledge; and knowledge the mother of wisdom and reason.

Curiosity is instinctive; hence, it pilots us to knowledge.

With full knowledge of two different routes to a city you wish to reach, one rough and hilly, the other smooth and easy to travel, which would you take? Why, with wisdom born of knowledge you would choose the easier route.

Then, after entering the city, you think you need a shave. You look around as you meander along; and finally you observe a striped pole on the sidewalk ahead. You will think, "There is a barber shop. I can get a shave there." Now, how do you know you can, as you have not tried yet? You simply reason that you can, because you have the knowledge that barbers do have such signs, and there must be a shop represented by that one.

I liken instinct to a root, and curiosity to a plant growing from it, and knowledge, wisdom and reason are products of that plant. Can you see it that way?

I believe that any form of animal life that can be taught to mind must reason ere they obey. If they do not, then tell me, someone, why do they obey?

Why does a dog crouch before his master when he has disobeyed? Simply because he reasons that punishment is liable to follow disobedience. He also has a knowledge of his master's tender feelings, as well as the wisdom to touch those tender feelings if he can by his ardent display of penitence.

I said Fred was "all right" but—I mean—pretty near all right. When, as I read his fox hunting narrative, I came to where his dog came up to him "wet with perspiration" I paused. He can get a big price for his perspiring dog.

CHAS. H. SMOELL.

Editor Forest and Stream:

The other day with a friend I took the dogs and went out into the woods. We took our way to one or two likely places, and at the first one, an old apple tree, got a point on an old partridge which was eking out a scanty subsistence on the seeds of the dried-up fruit. She didn't stay long, for the crunching snow was too sure a warning. But after both barrels [imaginary] we marked her down—ours, if it had been dear old October. Next, we visited a sure place for woodcock and found two. Just imagine old aristocrat on his uppers, and no coal in the cellar. The first one was a good-looking old gentleman; and Lee found and pointed him three times before he left. It was amusing to see the dogs look up the bare spots—wonderful how they certainly reason it all out.

Here is a little dog story about a dog of mine—but that makes no difference—I always admit of others. Lee has used a certain chair for his bed ever since we have had him. The chair was covered with a lounge cover. A day or two ago we sent the chair away for recovering. At night Lee could not find his chair. He inquired of the cat and the baby where it had gone, and coaxed us to help him find it. He searched the house; but all he could find was the cover, which hung on a line in the back kitchen. So, while we were getting ready for bed, in he walked, dragging the cover. He put it down over near where his chair should have been, and then lay down on it and went to sleep. Reason? Instinct? or just dumb luck?

E. D.

Brunswick Fur Club.

A SPECIAL meeting of the Brunswick Fur Club was held at Mechanics' Hall, Boston, on April 4. President O. F. Joslin presided, and twenty-two members were present. The following gentlemen were elected to active membership: B. N. Hamlin, Horace F. Fuller, L. W. Campbell, B. P. Williamson, C. J. Prouty, Geo. W. Jacques, C. F. Harris, Wm. H. Simonds, J. T. Flannelly. The report of the committee on the revision of the constitution and running rules was accepted. It was voted to hold the field trials at Barre, Mass., during the week of Oct. 16. A vote of thanks was extended to President Joslin for his generous present of \$50 to the club. Adjourned. BRADFORD S. TURPIN, Sec'y.

Yachting.

Yacht Designing.—XXVIII.

BY W. P. STEPHENS.

(Continued from page 275, April 8.)

THE proper manipulation of the drafting instruments is but a small matter compared with the larger problems of naval architecture which are involved in yacht designing; but it is nevertheless indispensable. The requisite degree of skill can only be acquired by study and practice, if possible under a competent instructor. No written directions can fully take the place of personal instruction, but at the same time the latter is beyond the reach of many. The general series of operations are: plotting, penciling in, inking, tracing, and in some cases tinting or shading. Every line of a drawing is dependent on one or more points, these being first located and the line drawn to or through them. These points are minute dots, made with a pencil having a sharp conical point. In Fig. 63 the scale is shown held by the finger of the left hand, while the two points marking the extremities of the proposed line are made with a conically pointed pencil. The other pencil shown on the paper under the left hand has a chisel point, broad and flat on both sides—something like a duck's bill. It is impossible to make a fine dot with such a point, but for drawing a long line it is much superior to the round point. Two pencils may be used, one with each style of point, or one-pencil may be sharpened on both ends. The double-ended pencils with movable leads are convenient, one end being used for plotting and the other for drawing lines. In Fig. 64 the two hands are shown, one holding the tri-

angle and the other with the pencil held lightly between the thumb and first and second fingers, drawing the required line. The ruler is held firmly by the left hand; if it be a T square, the head is held tight against the left edge of the drawing board. The line is invariably drawn along the edge furthest from the body, and this edge is placed not directly on but a short distance below the point or points which mark the position of the line. A space of 1-32 to 1-16 in., called *daylight* is left between the point and the edge. The ruler in position, the line is drawn by a quick steady motion from left to right. Where the T square is used all horizontal lines are drawn with it, the vertical and inclined lines being put in by means of the various triangles. For marine drafting, in which many long parallel lines are necessary, the T square may be replaced by the long straight-edge held in place by a couple of flat bricks or lead. It is absolutely essential that, however held, the ruler should not move while the line, or series of lines if they are parallel, is being drawn. In laying out the design in pencil the fewest possible number of lines should be drawn, and each should stop at its proper limit, not continuing indefinitely to be erased later.

While a certain amount of erasure and change is unavoidable the exact length and position of each line should be carefully determined before any attempt is made to draw it, even in pencil; the design as a whole should be carefully considered so as to avoid the necessity for changes of the general plan, and the paper should be kept as clean as possible. The best and quickest work in drafting is done by careful planning of the design in advance; drawing each line in its proper order and exact position and shape, and leaving the least possible amount of change and cleaning up to be done at the end. In Fig. 65 is shown the position of the left hand in holding the triangle against another triangle, T square or straight-edge, as it is constantly used in drawing a series of parallel lines, as in sectioning. The guide or fixed triangle is held by the thumb and little finger firmly on the paper, the ruling triangle is held by the first, second and third fingers, and is slid along the requisite distance by a slight movement of these fingers. It is a great aid to the draftsman to be able to perform this rapidly and certainly, holding the guide ruler immovable at all times and alternately moving the other the correct distance and then holding it while the line is being drawn. A good deal of practice will be

Fig. 63.

required before this can be done. In drawing with either pencil or pen, the instrument should be held, not by the extreme point, but as high up from the point as possible, so as to avoid cramping the fingers and to give a free sweep to them. In drawing short lines with the triangle or set curve as a guide, the pen or pencil is held nearer to the point, the third and little fingers resting on the ruler and helping to steady it, as partly shown in Fig. 65. In drawing along a batten this is impossible, as the fingers must be raised well clear of the weights. In drawing any long line, by the straight-edge or batten, the pen is held high up, as in Fig. 66, and the drawing is all done from the shoulder rather than the wrist, with a long steady sweep of the whole arm. In this work, such as the inking in of a sheer line or level line 4 ft. long, the body should be poised easily and naturally on both feet, the weight being thrown on the left foot as the pen starts at the left end of the batten, and being transferred to both feet and then thrown on the right foot as the end of the line is reached. It is no easy matter to ink in a line 4 ft. long, especially on tracing cloth, and leave a hard even width of black.

Sharp tools are essential to good work; the pencils should have a long taper to the wood with about half an inch of lead projecting; this point being brought to the desired shape, conical or flat, by rubbing on a fine file or sandpaper. These should be kept out of the way, at a distance from paper and instruments, as there will always be an abundance of very fine black dust about them.

The drafting pens should be brought to a round point, similar to a duck's bill, the edges of each blade being just sharp enough to avoid cutting thin paper. Sometimes the points are worn down so short that it is necessary to have them ground by an instrument maker, but if only the edges are dull, as often happens with continual use, they are sharpened by setting the two points quite close together by means of the adjusting screw and then *tickling* them up with a small piece of oilstone. The pen should be held firmly in one hand, in a good light, and carefully rubbed by the stone, held in the other hand, until it is seen that the points are of equal length, practically semicircular in outline, and each with a keen edge. The pen may then be lightly dressed on the edges and outside of the blades on a piece of very fine emery paper held on some flat surface, after which the blades are opened until about parallel at the points and the inner sides dressed up on the emery paper wrapped around a flat piece of wood of the correct thickness to fit between the points. After this the points are closed and whetted back and forth over the emery paper in such a manner that, the pen being held constantly vertical in one direction, the end of the handle described a semicircle and at the same time the whole of the semicircular end of each blade is brought in contact with the paper.

After this is done the pen is thoroughly cleansed of all oil and dirt, some ink is freshly mixed and the pen filled, using a clean steel writing pen for transferring the

ink from the saucer to the pen. The points are set close together and a line of medium width is drawn; this should be evenly continuous from end to end, drying with a black gloss if both pen and ink are right. It may be necessary to rub more ink, to get a deeper degree of blackness, or to touch up the points of the pen to secure a more even distribution.

When a good line can be drawn at one stroke, or possibly by a second over the first, the pen should be set very fine and a thin line drawn, a harder test than the first. After this has been successfully accomplished, the screw is loosened and the blades separated to make as wide a line as can be drawn, upward of one-eighth of an

Fig. 64.

inch. When the pen will draw this cleanly and evenly, it may be accepted as in good working condition. In the case of the pen points of compasses and bow pens, the sharpening is a more difficult matter, as the point must be held at one particular angle and cannot be held in slightly different positions, as when the plain pen is held in the hand. The most difficult of all pens to sharpen are those of the smallest bows of the old pattern, Fig. 45; the new bows, Fig. 47, can be handled much more readily and held at the best working angle to the paper.

After a more or less intimate acquaintance with most of the implements of the shipwright, from the *spud-wrench*, *old-man* and *ratchet-drill* of the shipyard to the *planimeter* and *integrator* of the drafting room, the writer has no hesitation in saying that the *drafting pen* stands alone among all tools as the most perfect embodiment of the innate cussedness of inanimate things. It will not work when dull or dirty, and it may not work even when new, sharp and clean, and properly nourished with good ink. There may be some draftsmen who can say why this is so, but to most it is an unfathomable mystery. A pen that is gentle and willing one day may be sulky and obstinate on the next under apparently the same conditions except that the work is more urgent. The only effective remedy for this state of affairs is the possession of a goodly stock of pens, which may be of various sizes and patterns and thus exactly suited for all varieties of work; while some at least of this collection will at any given time be in a working humor.

With the pencil the draftsman may if he chooses draw a line close to, in fact almost under the lower edge of the ruler, but with the pen it is advisable to keep a safe distance away from the edge (almost a sixteenth of an inch) or the ink may suddenly leave the pen and run over, down and under the ruler, a bad blot following. At the same time it is quite possible for the practiced hand to draw an ink line, especially a fine one, almost touching the ruler, and it is sometimes desirable to do this.

The pen should if possible be held exactly perpendicular to the paper, both in the direction of the line and transversely; but it will often be found that the point will work better if held at a slight angle, the end of the handle inclining slightly forward, to the right, or in toward the body. Whatever this angle may be at the start, it should be maintained for the entire distance, or the line will not be parallel with the edge of the ruler, but wavy and crooked. If the edge of the ruler is very thin, about 1-16 in. as in the ordinary set curves, there is very little trouble from this cause, but on the other hand there is a much greater chance of blotting through the edge of the pen touching the ruler and the latter drawing out all the ink. With a thick ruler, of 1/8 in., as in some

Fig. 65.

straight-edges and T squares, or even of 1/4 in. as in the larger battens, there is much less danger of this blotting, but any slight change in the angle of the pen is sure to make a crooked line. At the same time the writer at least prefers to draw with a thick rather than a thin edge.

In some cases, as in drawing the very slight curves of a boom or mast in a sail plan, a thick ruler may be used to advantage, the point of the pen being close to the edge at the start, with the upper end inclined outward, from the body. As the pen moves ahead, the handle is slightly inclined in, the point curving away from the straight edge until the swell of the spar is reached, when it is gradually thrown out until at the end of the line the point almost touches the ruler. In this way many lines that are not straight, but still of too slight a curvature for either the set curves or the spline, may be readily drawn.

In the every-day practice of the draftsman there are three points on which opinions differ as to the best pos-

sible methods. In the first place, in the general construction of the drawing, the pencilling may be carried on quite rapidly, the lines being all drawn in full, not *dotted* or *broken*, and no special care being taken to stop each at its correct ending but leaving more or less pencil work to be subsequently erased. In this case it will be necessary in the inking to determine the proper nature of each line, *solid*, *dotted* or *broken*, as well as its limits, as it is drawn, and to use the pen accordingly. In the alternative plan each line is put in with the pencil in its final shape and position, so that there is nothing to do in the inking but to copy exactly the pencil lines with the pen. This method perhaps takes more time in the end than the former, but there is no doubt that it is the correct one, and the beginner will do well to accustom himself to it. One important advantage is that after the pencil drawing is once completed by the designer, it may be turned over to a comparatively inexperienced hand, so far as planning and designing go, who will merely copy it mechanically with the pen.

In some cases where this method is followed the drawing is made with a HHHH pencil instead of HHHHHH pencil and is not inked in at all, but a tracing in ink is taken from it; both for a permanent and legible record and for blue printing. In case of subsequent alterations in the design, as is often the case in machinery, parts of the original drawing are erased, new ones pencilled in, and a fresh tracing made.

Another point is in regard to erasing and cleaning, it is the practice of some draftsmen to make no erasures of errors or blots during the pencilling and only to clean up the drawing before inking; while others use every effort to keep the drawing correct and clean all the time. This latter method may involve some serious erasures, which will mar the surface of the paper and interfere with the inking; but it is decidedly the better. For one thing, if a man stops at once as soon as he has made a blot or an error and takes the time to correct it, he is likely to be much more careful than if he leaves everything to some indefinite time in the future when he will clean up and correct everything before inking. We should advise the learner to stop as soon as a mistake has been made, either in pencil or ink, and to remove all traces of it as fully as possible before going on with the work.

The third point concerns the inking in. It is the practice of many to complete the drawing entirely in pencil before a line is drawn in ink; while others complete the main part of the work only, and ink it in afterward, adding various details in pencil. There may be occasional conditions which justify this method, but as a rule the

Fig. 66.

drawing should be completed to the last line in pencil before any pen work is begun.

In default of practice in a good office, or instruction under a competent teacher, the learner will have to rely on his own ingenuity in planning the most expeditious methods of plotting and pencilling; his main construction lines, the foundation of his drawing must be correctly placed on the paper and must be absolutely accurate in their relations to one another; they must also be arranged so that distances may be quickly plotted on and measurements taken from them. Some of the auxiliary lines will not appear in the completed drawing, and these may be drawn only in part, enough perhaps to give an intersection or a tangent. All similar distances should be set off and all circles of the same diameter drawn at one setting and handling of the dividers or compasses. There are many small points of this kind which it is difficult to particularize, but which at the same time do much to lessen the time and labor of drafting.

[TO BE CONTINUED.]

The Canada Cup.

As in the case of the 90-footers, the greatest possible secrecy is being maintained as to the dozen yachts building for the challenge and defense of the Canada cup, but some little news is leaking out. Concerning the Duggan boat, the Montreal Gazette says:

The utmost secrecy pervades Harry Hodson's yards, and will continue for some weeks yet. The cause of all the mystery is the building of the 35-footer for the defense of the Canada cup. The vessel under construction is owned by the J. Wilson Morse syndicate of the Royal Canadian Y. C., and is being built from designs by Mr. G. Herrick Duggan. The particulars are being kept secret. The frame, which is of oak and elm, is in position, and is kept carefully under lock and key in a sheet iron building at the end of Hodson's wharf. The employees have strict orders to keep all curious people at bay.

The first strake of planking has been placed upon the frame, but the work is now at a standstill awaiting the shipment of British Columbia cedar for the remainder of her planking. As far as can be learned the craft will be of extreme lightness and will embody several radical changes in the accepted model for 33-footers. In spite of the delay in the arrival of planking material, the boat will be ready for landing on May 1. The contract calls for the delivery of the little vessel complete at the middle of May.

The public will not be allowed the slightest glimpse of the Toronto candidate for the defense of Canada's cup until she slides into the water.

The following is from the Toronto Globe:

There will be a Canada cup defender from the Halifax design after all, and it won't be built in Hamilton, either, though that hope was entertained but a short time ago. The Halifax designer is Mr. H. C. McLeod, general manager of the Bank of Nova Scotia, who has been very suc-

cessful with his productions, both on the ocean and the inland lakes. He was formerly the agent of the bank in Chicago and was chosen as one of the committee of management of the first Canada cup race. The project of building from the design of Mr. McLeod was taken up by Commodore Jarvis on his recent return to the city. With the co-operation of Vice-Commodore J. H. Plummer, the necessary funds are so far assured that the order to begin work on the new boat has been given to Capt. Andrews of Oakville, from whose shop Canada was put into the water two years ago.

It is said that this latest decision to add to the number of trial yachts has developed another possible boat, making three Toronto defenders in addition to the three under way in Hamilton.

The following is from the New York Tribune:

A. G. Cuthbert came to New York yesterday to arrange to introduce the alco-vapor launch in Chicago waters. The 35-footer Veva, which is being designed for Vice-Commodore Peare, of the Chicago Y. C., and which is intended to back the international challenge for the Canada cup, will be an improved Sylvia. Sylvia has taken fourteen first and five seconds out of twenty-one races, and in the contests in which she took second place she was beaten by her sister yacht, also designed by Cuthbert, called Mirage. It is a singular fact that although Sylvia was built and raced in 1893, two years before Defender appeared, she is the exact counterpart of that Herreshoff flyer, except that she is slightly deeper in proportion. On being worked out on a scale the principal measurements, other than draft, are the same within an inch.

Columbia.

LATE last week it was announced officially that Mr. C. Oliver Iselin had given to Sec'y Oddie of the New York Y. C. the name Columbia for the cup defender now building for Com. Morgan. This news sets at rest the numerous rumors as to the other names that have been for some time current. Sufficient work has been done on the topsides of the yacht to confirm the report that they, like the bottom, will be of Tobin bronze. The work on all parts is progressing steadily, and the yacht will be launched early in June. The brass foundry at Warren has been leased by the Herreshoffs for the making of the numerous small castings, and work has been begun on a foundry as a permanent addition to the Bristol plant.

The Boston Globe has collected a lot of information concerning the sail plan, and though it may not all prove correct, it is sufficiently probable to be interesting at the present time.

Unless all signs fail and all present indications are wholly at fault, there is a big surprise in store for those who have confidently predicted an increase of 15 per cent. of sail in the new cup defender over the old, and who have figured the gain by a rough addition of five or six feet all around in the spars of the new boat over those of the champion of '95.

Although the Globe cannot say so to a certainty, yet the information now in its possession as to the spars of the new boat leads to the conclusion that the increase in sail area will not be over 5 per cent. At the same time the information points to a far more effective sail plan in this increase of 5 per cent. than in the 15 per cent. increase given in connection with any so-called "approximate" designs.

The sources of this information cannot be given, for the steel gaff and boom are being made in the Herreshoff shops under lock and key, and watchmen to guard; while the wooden mast, bowsprit, topmast and spinnaker pole, which are ready for shipment in the shop of the Boston Spar Co., at East Boston, are hardly more available for observation. Nevertheless, the Globe believes its information to be accurate, even if it upsets some preconceived ideas of what was being done.

According to this information, the spar dimensions are as follows, the figures in each case being the limit shown by the spars before their final finish: Mast 107ft., boom 101ft., gaff 65ft., topmast 62ft., bowsprit 38ft., and spinnaker pole 74ft. A 20ft. masthead and a housing of 9ft. below the deck would make the mast 78ft. from deck to hounds, or 6ft. more than in Defender. The main boom is 5ft. shorter, the topmast 5ft. longer, and the bowsprit 4ft. shorter than Defender's, while the spinnaker pole is about the same length.

With the known position of the mast in the new boat as between frames 28 and 29, the sail plan for the purposes of measurement for time allowance can be very closely calculated. It figures to about 600 square ft. more than that of Defender, or about 5 per cent., but at the same time it shows an increase of actual sail of about 500 sq. ft. in the mainsail, leaving only 100ft. to go into the head sails, or a very great increase in the area of the principal driving sail in proportion to the increase on which an allowance tax is paid.

This sail plan is shorter on the base line and longer on the perpendicular than that of Defender, and therefore carries more sail aloft where it will do the most good in light airs, and where it is more effective and more easily kept in place than as if it were lower down. The figures and the proposition itself are somewhat surprising at first, since the easiest way to increase a sail plan would be to add on something all around, but a little consideration of the matter and of the conclusions to be drawn from certain known data will show the plan to be a logical and practical one, even if Measurer Hyslop's tape shall finally show it to be wrong.

Many figures were made on Defender's sail plan while she was building and after she was under way, but Measurer Hyslop's figures, just before the cup race, were the first official or authoritative ones obtained, and they showed that presumably positive information was by no means correct. Defender was not officially measured until the last possible moment, and the same will undoubtedly be true in the case of the new boat.

In considering the sail plan of the new boat the placing of the spars as well as their length is of the utmost importance. The position of the mast is known, and this is a good starting point for obtaining the base line for the purposes of measurement. The fore side of the mast is

at frame 28, or practically 47ft. 6in. from the stemhead. Housing the 38ft. bowsprit about 10ft., as in Defender, gives it a length of 28ft. outboard. Deducting from this length about a foot and a half for finishing at the other end, and for the attachment of the headstays, gives a measurement of about 74ft. from the side of mast to forward point of measurement midway between the jibstay and foretopmast stay.

Under the measurement rule of the New York Y. C., any excess of length in the spinnaker pole over the distance just given is added to the base line. Hence all spinnaker poles are made just under this length to avoid being taxed, while at the same time they are as close as possible to the distance so as to get the largest possible sail. In Defender the distance from foreside of mast to forward point of measurement was 73.55ft., and the spinnaker pole was 73.36ft. long. In the sail plan now under consideration the distance is about 74ft., and the length of the pole not many inches under the same figure. Taken together the figures should closely fix the length of base of the forward triangle. This base is not officially measured except to determine any tax on the spinnaker pole, but in the present case it is valuable in helping to determine the entire base line.

The official base line is from the forward point of measurement to end of main boom, to which is added any excess of length of gaff over 80 per cent. of the topmast, measured from the hounds to lower side of sheave of top-sail halyard block. Taking the boom at 100ft. and allowing 3ft. for mast and gooseneck fittings, a liberal allowance, a base line of 178ft. is obtained. Allowing 1ft. on the topmast for fitting and the drop of the topsail halyard block gives a measurement length of 61ft., and with a 65ft. gaff an excess of 16ft. of gaff over 80 per cent. of the topmast to be added to the base line, which brings the latter to 194ft.

The perpendicular next claims attention. This is measured from upper side of mainboom to lower side of sheave of topsail halyard block. With a measurement of 78ft. deck to hounds, an allowance of about 3ft. must be made for the distance of the upper side of the boom from the deck. This gives 75ft. up to the hounds. Add to this the length of the topmast, 61ft., and a perpendicular of 136ft. is obtained. Defender's perpendicular for measurement was 128.48ft. The sail plan of the new boat is therefore nearly 16ft. higher in the air. To obtain the sail area, multiply the base by the perpendicular and divide by 2. The result is 13,242 sq. ft., or 640 sq. ft. more than Defender at her official measurement of 12,602 sq. ft.

This, it must be remembered, is the sail area for measurement, and not the actual sail area. The rule was devised to get as closely as possible the area of the working sails, including the topsail, together with something for a jib topsail. The actual area of the working sails is less than this figure, but in the plan under consideration the mainsail figures roughly in the neighborhood of 500 sq. ft. more than in Defender, wherein lies one of the merits of the plan.

Variations of a few inches all around in these figures, either more or less, would give a different result, but the area as given is not far out from what it is believed the new boat will carry. If there are additions they will show on boom and gaff rather than in perpendicular or forward portion of the base line.

Now for the reasons for such a sail plan. In the first place Defender carried a strong lee helm, which all additions to her after sail by lengthening her boom and gaff failed to entirely correct. Her head sails were also materially cut down to help in this direction. These things were kept very quiet in '95, but have since become known, and it was fully as much to correct the fault of a lee helm as because she could carry more sail, that the mainsail of Defender was increased. The addition of two feet in height when the new mast was made was probably as effective for speed as the addition of 5ft. to boom and gaff. The necessary cutting down of the head sails was always a source of worry.

In the new boat Herreshoff has set the mast between 4 and 5ft. further aft than in Defender, and at the same time has retained practically the same length of base line to the triangle of the head sails. This would make the 101ft. boom come about as far aft as the 106ft. boom of Defender, and would practically mean the adoption of the length of base line originally given Defender, while at the same time giving the proper balance to the new boat by setting the whole sail plan as much farther aft as was found necessary to correct the carrying of a lee helm in '95.

Or, to put it a bit differently, it may fairly be reasoned that Herreshoff adopted in '95 a rig which was as long on the base line as would be properly effective and could be comfortably handled. He made additions aft to correct the balance of his boat rather than because he thought them the best way to get increased speed. This year he starts with about the same base line as originally decided upon, but balances his boat properly in the light of experience and then carries the additional sail he needs for speed away up in the air where it is taxed the least and will do the most good.

Certainly the new rig, judging by experience in smaller craft, will be more effective by being comparatively narrow and lofty rather than spread out on the base line. The new boat has plenty of added power to carry it and it is known that her designer wishes her to heel well out when sailing, so as to gain all the advantage of her long overhangs, and has given her a "tumble home" to her topsides in the expectation that she will sail in just that way.

Another point in favor of the new plan is that the excess of gaff to be added to the base line is only 16ft., when in Defender it was 19ft. The only question in the writer's mind as to the plan is as to whether it gives sufficient aftersail to balance the boat. He frankly confesses he is not enough of a naval architect to answer the question definitely, and can only say that it seems likely to do so. In view of the apparent placing of the center of lateral resistance, but little further aft than in Defender.

In any event he has outlined a consistent and possible, as well as probable, sail plan, and confidently expects that any changes that subsequent information or Measurer Hyslop's tape may show, will be in the direction only of more aftersail.

In the meantime the new boat's wooden spars—her

mast and duplicate topmasts, bowsprits, spinnaker poles and sets of club topsail poles—are still in East Boston, and will remain there until the completion of a set of spars for W. O. Gay's new 70-footer, for which set an order has recently been received by the spar company. All the spars will then be shipped together to Bristol by barge or schooner. The large spars will be put overboard at East Boston and be towed to Fiske's Wharf in the city proper, where they will be hoisted out by the big shears, and placed on the deck of the craft that is to carry them around the Cape. The smaller spars will go to Fiske's Wharf by team.

The big mast for the new defender lies in plain view in the spar company's shop, but Mr. Bailey does not encourage close inspection by visitors. The other spars are so piled up as to defy inspection were opportunity afforded. Mr. Bailey is naturally affable and disposed to give information about the work in which he takes a pride, but in this case the mantle of Herreshoff secrecy has included him in its voluminous folds. He may possibly find it oppressive, but he does not say so, since the Herreshoffs are good customers. Under these circumstances he can hardly be blamed for being close-mouthed.

But the spars will get out from his hands some time, and there will then be a chance for the verification of what are now believed to be their correct dimensions.

The Seawanhaka Cup.

THE race committee of the Seawanhaka-Corinthian Y. C. has issued a notice of the change of date for both trial and cup races, in consequence of other important yachting events. The trial races at Oyster Bay will be sailed on July 3, 5 and 6; while the cup races at Dorval Lake, St. Louis, will be sailed on July 26 and the succeeding week days. Up to the present time two 20-footers are promised for the challenging side, a new and an old boat. The new boat, already mentioned in these columns, was designed by B. B. Crowninshield, of Boston, for a syndicate of the Bridgeport Y. C., including Messrs. T. H. Macdonald, W. Herbert Jennings of Southport, Archibald McNeil, T. L. Watson, De Vere H. Warner, James H. McElroy and Edgar D. Chittenden.

She will be built by Lawley & Co. and will be 32ft. over all, 17ft. 6in. line and 8ft. beam; the planking being covered with canvas.

The other boat, also a Boston craft, is described as follows in the Globe; her photo was given in the FOREST AND STREAM of Sept. 3, 1898:

Boston will not only be represented in the trial races by a Boston designed and built boat, but also by one that is owned as well as designed and built here. The champion 18-footer Duchess, challenger last year for the Quinncy cup, will have her sail plain reduced to conform to the limits of the 20ft. Seawanhaka class, and will be entered for the races at Oyster Bay. She will be sailed by Arthur H. Parker, one of her present owners, and with him will be his brother Frank and C. D. Mower, designer and builder of the boat.

Duchess at present measures close to 18ft. water line, with 600lbs. for weight of crew on board, but will easily come under 17ft. 6in. waterline with the 450lbs. required under the Seawanhaka rule. This will allow her the limit of 500ft. of sail. It will be quite a reduction from her present 670ft., but she will carry less live weight and should be better in a breeze. Neither her owner nor her designer expect to win out against the new Crowninshield boat for the Bridgeport syndicate, but they are looking for sport, and expect to get it.

The new boat is a little narrower than Duchess, and is also more on the "scow" model, and should have the advantage of Duchess in ordinary racing weather. It is hoped to "try out" the new boat with Duchess in some of the races here before taking her to Long Island Sound. Duchess will probably lose her chances of winning the Y. R. A. championship again, because of the change in her rig, but she has had "heap plenty" honor in that direction already.

It is also reported that a second new defender, in addition to that ordered by Com. Ross, will be built at Dorval.

If You Want the Whitest and Best

Maryland Sportsmen's Exposition.

Revolver Contests.

The conditions governing the revolver contests, April 18 and 19, Baltimore, Md., are as follows:

"Military" revolver contest, any revolver issued by U. S. Government to State troops, having fixed regulation sights. Ammunition—Service cartridge of caliber used. Thirty shots, in six-shot scores; cleaning allowed between scores. Contestants are permitted 30 minutes to complete the entire score. Range—Twenty measured yards. Four-inch bull counts 5; 6in. ring counts 4; 8in. ring counts 3; balance of card counts 2. Contestants—Any member of any military organization in the service of the State of Maryland. Where unknown to the manager, credentials will be required. Entrance fee—\$2, including cartridges and entrance to the grounds. Position—Arm extended, free from any support. Prizes—First, gold medal and amateur championship of Maryland, with military revolver; second, silver medal; third, bronze medal. Ties—Shooting is class shooting, the three highest scores to win, and all ties must be shot off in six-shot scores until decided. Shooting will begin at 3 P. M., April 18, and entries may be made at any time thereafter up to 9 P. M., after which the entry list will be closed. Shooting will stop promptly at 10 P. M., and unfinished scores or ties will be shot off the following day, at a time to be designated by the manager. Contestants are required to shoot as soon after making their entry as possible, so there shall be no unnecessary delay. The gallery will be open in the morning for practice to all bona-fide entries.

Conditions of "Any" revolver contest: Any revolver and any ammunition. Range—Twenty measured yards. Target—Standard American target, reduced for 20yds. Bull counts 5; first ring, 4; second ring, 3; balance of card, 2. Position—Arm extended, free from any support. Number of shots—Thirty, in six-shot scores; cleaning allowed between scores. Entrance fee—\$2. Ammunition extra. Division of money—One-fourth of entrance fees to go to management; the other three-fourths to be divided into 40, 30, 20 and 10 per cent. Class shooting, ties to be shot off in six-shot scores until decided. Contestants—Anybody can enter this contest by paying entrance fee. The manager is sole ref-

erec and his decision is to be final. Ammunition is not furnished in this contest, and contestants who have not provided their own ammunition can buy it at the store, and also hire a revolver if necessary. Shooting will begin at 3 P. M., April 19, and continue until 10 P. M. Contestants may enter at any time, but will be expected to shoot as soon as possible after they have entered. No entries taken after 3 P. M. Re-entries will not be permitted.

Rifle About San Francisco.

SAN FRANCISCO, Cal., April 10.—The California Schützen Club held its annual spring festival at Schützen Park on the 2d inst. There was a very large attendance of riflemen, several clubs from the interior counties being represented.

The honorary or merchandise target was most patronized. The conditions were: 3 shots, 200yds, 25 ring target, tickets \$1 each. Highest scores were: Strecker, 72; Foktor, 72; Kuhnle, 72; Schmid, 71; Pape, 71; Mason, 71; Otschig, 71; Gruhler, 71; Walden, 70.

Cash target, 4 shots, tickets each \$1. F. P. Schuster, 95 rings, \$30; Dr. L. O. Rogers, 94, \$25; J. Utschig, 94, \$20; A. Strecker, 93, \$15; C. J. Walden, 93, \$12.50; O. Bremer, 93, \$10; A. H. Pape, 92; D. W. McLaughlin, 91; D. B. Faktor, 91; E. Semid, 91.

Scores at Shell Mound Range yesterday: First champion class, John Utschig, 446; second champion class, R. Stettin, 421; first class, H. Stelling, 414; second class, August Jungblut, 395; third class, J. Beutler, 364; first best shot, J. Beutler, 25; last best shot, August Jungblut, 25.

For Bushnell medal—D. B. Faktor, 227; Dr. L. O. Rodgers, 214; F. P. Schuster, 214.

Competition for cash prizes—F. Rust, 72; D. B. Faktor, 71—71—70; John Utschig, 70; F. P. Schuster, 69; David Salfeld, 68.

At the monthly medal shoot of Company C, First Infantry, National Guard of California, the following were the best scores out of a possible 50: Chris Meyer, 46; Charles Waltham, 45; H. Kennedy, 42; L. W. Grant, 39; T. McGilvery, 39; F. V. Northrup, 35.

The Columbia Pistol and Rifle Club held its monthly target practice, with the following results: Class medals, experts—A. H. Pape, 45; Dr. Rodgers, 51; F. E. Mason, 71. Sharpshooters—J. E. Gorman, 75; G. M. Barley, 78; O. A. Bremer, 97; M. J. White, 148. Marksmen—E. N. Moore, 96; G. Mannel, 102; Mrs. White, 120; C. F. Waltham, 121; Mrs. Waltham, 132; A. W. Tomkins, 185; J. F. Twist, 197.

Trap-Shooting.

If you want your shoot to be announced here send to notice like the following:

Fixtures.

First and third Fridays of each month.—Watson's Park, Burnside Ill.; Semi-monthly contest for Montgomery Ward & Co.'s diamond badges.

April 17-22.—Baltimore, Md.—Prospect Park Shooting Association's tournament; \$500 added. Stanley Baker, Sec'y.

April 19.—South Hingham, Mass.—Annual tournament of the Hingham Gun Club.

April 22.—Wissinoming, Pa.—Philadelphia Trap-Shooters' League tournament. J. K. Starr, Sec'y.

April 25-27.—Kansas City, Mo.—Ninth annual tournament of the Missouri State Amateur Shooting Association, under auspices of Washington Park Gun Club; \$400 added money; target and live birds. Walter F. Bruns, Sec'y.

April 25-26.—Gretna, Neb.—Target and live-bird tournament; \$200 added; open to all. H. M. Hardin and C. B. Randlett, Managers.

April 25-28.—Baltimore, Md.—Tournament of Baltimore Shooting Association; targets and live birds; Money added. H. P. Collins, Sec'y.

April 25-27.—Osceola, Ia.—Osceola Gun Club's tournament.

April 26-28.—Temple, Tex.—Texas State Sportsmen's Association's tournament.

May 2-5.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-third annual tournament, under the auspices of the Capital City Gun Club; six amateur and four open events each day; targets and live birds. R. M. Welch, Sec'y.

May 6.—White Plains, N. Y.—Live-bird handicap. E. G. Horton, Manager.

May 9-13.—Peoria, Ill.—Illinois State Sportsmen's Association's tournament. C. F. Simmons, Sec'y.

May 16-19.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. F. W. Bacon, Sec'y.

May 16-20.—St. Louis, Mo.—Tournament of the Missouri State Fish and Game Protective Association. H. B. Collins, Sec'y.

May 17-18.—Oil City, Pa.—Interstate Association's tournament, under auspices of Oil City Gun Club. F. S. Bates, Sec'y.

May 23-25.—Algona, Ia.—Tournament of the Iowa State Association for the Protection of Fish and Game. John G. Smith, Pres.

May 24-25.—Greenwood, S. C.—Annual live-bird tournament of the Greenwood Gun Club; 25-bird Southern Handicap. R. G. McCants, Sec'y.

May 26-27.—Tyrone, Pa.—Target tournament of the Tyrone Gun Club. D. D. Stine, Sec'y.

May 30.—Canajoharie, N. Y.—All-day target shoot at Canajoharie, N. Y. Charles Weeks, Sec'y.

May 30-June 2.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. Frank W. Bacon, Sec'y.

June 5-10.—Buffalo, N. Y.—New York State shoot, under the auspices of the Buffalo Audubon Gun Club; \$1,000 guaranteed; over \$2,000 in merchandise, and \$1,000 added money in open events. Chas. Bamberg, Sec'y, 51 Edna Place.

June 6-9.—Sioux City, Pa.—Fifth annual amateur tournament of the Soo Gun Club. E. R. Chapman, Sec'y.

June 21-23.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under the auspices of the Sherman Rod and Gun Club. J. C. Porterfield, Sec'y, O. T. S. L.

June 14-15.—Bellows Falls, Vt.—Interstate Association's tournament, under auspices of Bellows Falls Gun Club. C. H. Gibson, Sec'y.

June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.

June 20-22.—Wheeling, W. Va.—Third annual tournament of the West Virginia State Sportsmen's Association, under the auspices of the Wheeling Gun Club, Wheeling, W. Va. John B. Garden, Sec'y.

June 27-29.—Altoona, Pa.—Target tournament of the Altoona Rod and Gun Club, Wopsononock Heights. G. G. Zeth, Sec'y.

July 1-2.—Milwaukee, Wis.—Grand tournament of Milwaukee Gun Club, in Carnival Week. S. M. Du Val, Sec'y.

July 19-20.—Providence, R. I.—Interstate Association's tournament, under auspices of the Providence Gun Club. R. C. Root, Sec'y.

July 18-20.—Little Rock, Ark.—Arkansas State tournament.

Aug. 9-10.—Portland, Me.—Interstate Association's tournament, under auspices of the Portland Gun Club. S. B. Adams, Sec'y.

Sept. 6-7.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The Glenville Gun Club Co., of Glenville, Ohio, has decided to hold a tournament on May 30th annually. The secretary, Mr. Robert W. Sterling, informs us that the club possesses a beautiful shooting park and club house, with ample provision for the comfort of all who attend. The programme provides for ten introductory practice shoots at 10 targets, followed by 10 events, of which three are at 10 targets, 50 cents entrance, four moneys; two at 15, \$1 entrance; one at 20, \$3 entrance; three events at doubles, 5-pair, 15 pair and 20 pair, respectively, \$1, \$2 and \$3 entrance; and one event at 5 live birds, \$5 entrance, money divided 60 and 40 per cent., birds extra. Shooting commences at 9 o'clock.

The programme of the Missouri Amateur Association's ninth annual tournament is now ready for distribution and can be obtained of the secretary, Mr. Walter F. Bruns, Kansas City, Mo. It is an artistic production in every detail. Three days' shooting is provided, each day having events at both live birds and targets. On the first day, April 25, there are two live-bird events—one at seven birds, \$5, \$10 added; one at 15 live birds, \$10, entrance, \$15 added. There are also 10 blue rock events, nine at 15 targets and one at 10 pairs, each having a uniform entrance fee of \$1.50, excepting No. 10, which is \$1; each has \$10 added money. Two live-bird events are provided for April 26. The first is at seven live birds, \$5 entrance, \$10 added; the second is at 15 live birds, \$10 entrance, \$25 added, and is the State amateur championship event. The present holder of the medal receives fifty per cent. of net entrance, and the remainder of the purses with added money will be divided in the usual manner. Ties for this trophy must be shot out. There are eight target events on this day, of which No. 5, at 50 targets, \$5 entrance, \$20 added, is the State team championship; teams of two men. The present holders of the Hunter Arms Company Cup will receive fifty per cent. of net entrance. The other fifty per cent., with added money, will go with the usual division; four moneys, Rose system.

On the third day there will be one event at live birds for the Schmelzer Trophy—20 live birds, \$10 entrance, \$100 added. Concerning this the management proclaims that "In order that all shooters may have an opportunity of competing for the beautiful Schmelzer Trophy the management has decided to accept entries from parties who do not wish to participate in the money, at \$5, which will pay for the birds only. Those paying \$10 entrance fee will compete for both trophy and divisions of money. These conditions are made for the sole purpose of catering to those who for any reason are opposed to entering a sweepstake money shoot. The trophy will become the permanent property of the contestant making the highest score in this contest. All ties for the trophy to be shot off at 10 birds." There are 10 target events provided for the third day, the entrance to which is \$1.50 each, excepting two, one at 20 targets, one at 5 pairs or 10 singles, the entrances of which are \$2 each. Each event has \$10 added. Shooting commences at 9:30. Interstate rules will govern the division of moneys in both live-bird, and target events will be governed by the Rose system, four moneys, the points being 5, 4, 3, 2, excepting that in case of fifty entries or more in the target events there will be five moneys. Professionals may shoot for price of targets. Grounds will be open for practice April 24. The annual meeting of the association will be held at the Midland Hotel on the evening of April 25.

From a representative of the St. Louis Shooting Association we have received the following:

Now that the Grand American Handicap has been decided, and in favor of a Western sportsman, the eyes of the shooting world are turned to St. Louis, where the twenty-second annual shoot of the Missouri State Game and Fish Protective Association will be held at Dupont Park May 15 to May 20, under the auspices of the newly organized St. Louis Shooting Association. With the exception of the tournament at Elkwood Park the shoot at St. Louis will be the biggest thing of its kind that will be held this year. More added money will be hung up at the Mound City tournament than has ever been offered at any similar shoot in the West. Besides this there will be medals and trophies galore. The St. Louis Republic has offered a cup, valued at \$500, for the champion wingshot of the world. What undoubtedly will be pleasant news to every honest shooter in the country is the fact that either the equitable or Rose systems of divisions of moneys will be used in St. Louis. The systems are bound to do away with that old habit of "dropping for place" which has marred some of the best shoots in previous years. A new club house is being erected at Dupont Park which will afford accommodations for 200 sportsmen. New traps are being placed, under the supervision of Superintendent Corray, and everything will be in lovely shape when the inaugural day of the shoot rolls around. The St. Louis shooting Association is composed of hustling young business men, and they will leave nothing undone to make this snoot a grand success. The officers of the association have gotten up a programme that appeals particularly to the amateur shot, and they are anxious that the simon-pure sportsmen journey to St. Louis in large numbers to compete in the tournament. To the professional they say, "Come, and you will be treated royally."

The annual meeting of the Brockton Gun Club was held at their club house on April 9. The following is a list of officers: President, J. W. Murdock; secretary, A. A. Barrett; treasurer, R. E. Brayton; executive committee, C. F. Kneil, W. A. Allen. The club is in excellent position financially. One of the prizes for the season will be a valuable medal, to be shot for under the following conditions: 30 targets, 10 unknown, 10 expert and 5 pairs, highest per cent. to win after a stated number of shoots. Merchandise prizes at regular intervals.

Mr. John B. Rogers, Warwick, N. Y., writes us as follows: "The annual meeting of the Warwick Gun Club was held on the evening of April 15th. The following officers were elected for the ensuing year: President, Clinton W. Wisner; vice-president, Geo. A. Williams; secretary, John M. Servin; treasurer, James A. Ogden; captain, W. Scott Lines; trustees, F. Dunning, J. L. Welch, W. S. Lines; handicap committee, John B. Rogers, F. Dunning and W. S. Lines. President C. W. Wisner presented the club with a cup to be shot for during the coming season, the conditions to be made known later. The club is in good financial condition and the prospects are bright for the coming year."

The "Illustrated Treatise on the Art of Shooting," by Charles Lancaster, in its sixth and popular edition, contains nearly all the information of the library edition. The price of the latter is \$3; that of the popular edition, which is neatly bound in cloth, is \$1. It contains in concise form hints on the proper manner of pointing the gun in making every possible kind of shot, with illustrations to make the matter perfectly clear to the student. Besides this, there is a mass of information on gun making, care of the gun, chokes, powders, penetration, velocities, pattern, etc., all of practical value to the shooter.

We publish a group of portraits of officers of the Interstate Association, the gentlemen who have done the executive work in making the G. A. H. the great success it has been and is. We regret that we were unable to add the portraits of Mr. W. F. Parker, of Parker Brothers, director and member of the executive and tournament committees; Mr. C. Tatham, of Tatham Brothers, member of the club organization committee, and Mr. Paul North, of the Cleveland Target Company, and member of the club organization committee.

Mr. Ed. Johnson, of Atlantic City, N. J., and Mr. T. Morfey, of Lyndhurst, N. J., will shoot 100-bird match at the latter place on Thursday, April 27th, for \$250 a side. Mr. Johnson has achieved great fame in recent matches, while Mr. Morfey's fame as a match shooter is also great. The contest should be of the highest order if the men are in their usual good form.

There will be a shoot between teams to be made up on the grounds of the Bergen County Gun Club, Hackensack, N. J., April 22. Sweepstake events also will be held. Trains at 12 M., 1:10 and 2:20 P. M. from the foot of Cortlandt street. C. O. Gardner, secretary.

On April 10, the day before the Grand American Handicap was begun, three important events were shot, one at five birds, \$5 entrance; one at 10 birds, \$10 entrance, and one at seven birds, \$7 entrance.

BERNARD WATERS.

Nebraska State Sportsmen's Association.

Mr. Geo. Rogers president of the Nebraska State Sportsmen's Association, writes as follows anent the coming tournament of the Association: The twenty-third annual tournament of the Nebraska State Sportsmen's Association will take place at Lincoln, Neb., May 2, 3, 4 and 5, under the auspices of the Capital City Gun Club. The management has \$650 raised and will add it to the different events. There will be each day six 15-target races, \$1.50 entry, \$15 added to each, and four 20-target races, \$2 entry, \$20 added. The 15-target events will be open to amateurs only, and the 20-target events will be open to the world, and all the cracker-jacks are invited. Two years ago the same club held the twenty-first annual tournament. I think the manufacturers' agents and professionals will admit that Nebraska has always treated them fairly, and we think that by making four open events each day the entries will be much larger and the purses greater than if we had made them all open sweeps. We anticipate nearly all the amateurs will want to try conclusions with the cracker-jacks. The Missouri amateur shoot precedes ours, and the Illinois State shoot at Peoria and the Missouri State shoot at St. Louis follow, and we feel sure of a good crowd making the circuit, which makes four weeks of continuous pleasure.

ON LONG ISLAND.

Oceanic Gun Club.

ROCKAWAY PARK, L. I., April 16.—The first day of this week the Oceanic Gun Club held its regular bi-monthly shoot at its grounds, Rockaway Park, L. I., and the race between the Oceanic and the Hudson Gun Club, of Jersey City, had to be postponed two weeks on account of inclement weather, and the lack of representatives of the visiting team.

New Utrecht Gun Club.

Woodlawn, L. I., April 15.—The weather conditions were favorable. The most interesting events were the three contests for the challenge plate. The first between Dudley and George, won by Dudley; the second between Dudley and Gaughen, won by Gaughen; the third between Dudley and Gaughen, won by Dudley. F. A. Thompson shot with the contestants in the second event for the challenge plate.

Several sweeps were also shot.

The Glenville Gun Club Co.

GLENVILLE, O., April 10.—The club, having held several tournaments at various times during the past two years of its existence, decided at a meeting of its board of directors last January, to hold May 30 as a permanent annual tournament, the first to be held this May 30 next.

The club is now well equipped with all facilities necessary to the pleasure of shooters, and their new large club house, with its beautiful shooting park and accommodations, will meet with the approval of all who may desire to attend.

Our members extend to one and all a cordial invitation to be with us on May 30 next.

The following scores were made at the last club shoot: Club event, 25 blue rocks. Hopkins, 21; May, 22; W. TeLinde, 12; F. Brown, 18; G. TeLinde, 19; Sterling, 21; Brockaway, 20; Fellows, 12.

ARNOLD SEAGRAVE, Sec'y.

Montpelier Gun Club.

MONTPELIER, Vt., April 10.—*Editor Forest and Stream:* At our annual meeting officers for the ensuing year were elected, as follows: President, Jos. G. Brown; Vice-President, F. A. Standish; Secretary and Treasurer, Geo. B. Walton; Executive Committee, C. L. Smith and W. E. Stoddard.

Our grounds will be open and ready for business the latter part of this month, when we shall be pleased to welcome all shooting friends who may be in our city.

We would like to call the attention of the Vermont shooters to the badge, emblematic of the championship of Vermont, for six-man team, which we still hold, and which we place in the market again this year, same as last, and subject to challenge. We shall be pleased to hear from you, boys, in reference to this, and will endeavor to arrange dates, etc., which will be as near satisfactory as possible to all concerned.

By Geo. B. Walton, Sec'y.

Kingsbridge Gun Club.

KINGSBRIDGE, N. Y. City, April 8.—Following are scores made by members of the Kingsbridge Gun Club at their regular monthly shoot, held to-day:

L. Brandt.....	1101110111—8	20001—2
O R Brandt.....	2220102100—6	01222—4

M R Weightman.....	2002220002—5	22002—3

Nine o'clock was the time scheduled for the shooting to begin and promptly at this hour Manager Shaner would call the contestants to the score. His excellence is in doing just what the programme announces. The successful management is but an

other evidences that he is in a class by himself when it comes to running a shoot.

Jack Fanning is back from the Coast, but will not remain in the East very long. Going from here to Baltimore, thence he will make Kansas City, Lincoln, Peoria and St. Louis in the order named.

Joe George is back in the shooting fold. Pigeons are not Joe's forte, targets being just to his liking. As he threatens to take in the Missouri State shoot it is likely we will be able to give a better account of him.

Lieutenant Du Bray, Parker Bros.' representative, was pleased to find so many of his company's gun in the hands of the principals at this tournament. He managed to go the entire distance, but owing to some hard luck could not finish in the money, landing just one short. In the last two handicaps he has averaged just 209, killing 23 in 1898 and 22 this year, a most excellent showing.

Charley Willard, although not a principal, was present during several days of the tournament.

Lou. Harrison, of Minneapolis, Minn., owing to illness was prevented participating in the handicap.

Tom Marshall has now participated in three handicaps, during which time he was compelled to shoot at 108 birds, of which he scored 106. In face of such a record it is not very strange that he should be a two-time winner. In '98 he scored 23, missing his fifteenth and twentieth bird. As he was the winner on each of the other occasions it will be readily understood that he had to score them all.

W. R. Clark, Irby Bennett and Jim Hildreth, of the Winchester Company, were present on nearly every day of the shoot, though they took no part in the contest.

Col. Martin made his appearance at Elkwood Park on Saturday prior to the handicap, remaining there until the day after its close. During all of this time, we are informed, he shot at a trifle over 500 birds, and lost but eight of this number, which is an average of over .989.

Mr. E. S. Lentillon, of the Dupont Company, came over on the last day to shoot in the consolation handicap, but, though he entered this event, he did not get to shoot owing to the fact that it had to be declared off as it was impossible to finish it.

Owing to the unusual pressure on our columns it is necessary to curtail personal mention, much as we regret to do so. We are aware there are many others worthy of mention, which we must defer until another time.

The post entries of the G. A. H. were Messrs. Geo. Roll, C. H. Green, Jr.; O. C. Bogardus, J. B. Robertson, W. C. Rawson, E. Stutevant, B. W. Claridge, H. Travers, M. F. Lindsley, R. L. Packard and R. Kuss.

After the ties were shot off there was insufficient time to shoot off the Consolation Handicap, a 15-bird event, \$10 entrance, and the Aud Lang Syne Sweepstakes, 10 birds, \$7 entrance.

Mrs. Milt Lindsley ("Wanda") was one of the lady contestants in the Handicap. While not so successful as the two other ladies, she nevertheless made some very excellent kills and attracted quite as much attention. Most of her shooting was from the 26yd. mark, not 25, as her handicap was made.

Elliston was free to admit that the birds in his match with Capt. Money were entirely too fast for him, and a revelation in that respect.

From the amount of talk one hears here in the East concerning the Missouri State shoot, it is more than likely that there will be a big delegation go out to this tournament.

PAUL R. LITZKE.

THE GRAND AMERICAN HANDICAP.

The Grand American Handicap for 1899, in the matter of entries, broad scope and greater public interest, far surpassed its predecessor of 1898, although the latter was justly valued as a phenomenal record breaker, and possibly a final one. Up to the time of closing the entries there was the greatest divergence of opinion in respect to their probable number. Not a few new hats were won and lost on the 250 figure, considered as being near the boundary limit by those who were in a position to make estimates based on logical probabilities. On each side of this estimate were the extremists—those who firmly predicted that the number of last year would not be reached, owing to differences of opinion concerning high guns and class shooting, and those who were sanguine that the number would reach near 300, owing to better times

THOS. A. MARSHALL.

Winner of Handicap, 1899.

in the business world, the greater interest manifested in pigeon shooting everywhere, and the steady natural growth of America's greatest shooting event year by year. The total number of entries was 278; of these twelve failed to fill, and ten were post entries, so that the total number of actual competitors was 266, a difference of 69 greater than the number of starters last year, and 71 greater in the total number of entries.

Thus, from a comparatively humble start in 1893 with 21 shooters, the Interstate Association has so wisely planned and conducted the handicap year by year that it has steadily grown in breadth and success, culminating in the contest of last week with the record-breaking number of 266 contestants.

As to the intervening years, the handicap of 1894 had 54 entries; that of 1895 61 (this contest was held in Lorillard Park, near Paterson, N. J.); 1896, 109 entries, of which 104 competed; 1897, 146 entries, of which 135 competed; 1898, 207 entries and 197 competitors. The winners were as follows: In 1893, Mr. R. A. Welch, of Philadelphia; 1894, Mr. Thomas W. Morley, of Lyndhurst, N. J.; 1895, Mr. John G. Messner, of Pittsburg, Pa.; 1896, Mr. O. R. Dickey, of Boston, Mass.; 1897, Mr. Thomas A. Marshall, of Keithsburg, Ill.; 1898, Mr. E. D. Fulford, of Utica, N. Y. This year Mr. Marshall won again, of which more hereinafter.

The dates were April 11, 12 and 13, as originally fixed, but it required four days to finish, with several events cut out of the programme at that. The weather was such as to permit of continuous shooting, and on the whole was favorable to good competition, though the high wind which prevailed at times made a swift

MR. T. A. MARSHALL AT THE SCORE.

sifting out of many shooters, some of whom were not equal to the difficulties it imposed, while many on the other hand suffered from the hardest of luck in having birds, killed in the air, blown out of bounds.

Tuesday, April 11, First Day.

Two events were on the programme for this day, namely, the Elkwood Park Introductory, seven birds, \$5 entrance, birds extra, high guns, three moneys, ties to divide. Consequent to the large number of shooters present and the impossibility of finishing both events, this one was declared off.

The Nitro Powder Handicap.

The unusual large number of contestants precluded all possibility of disposing of both events scheduled for this day, therefore the management decided to shoot only the Nitro Powder Handicap, cancelling the Elkwood Park Introductory.

The Nitro Powder Handicap conditions were: Fifteen birds, \$10 entrance, handicap rise; high guns. According to the provision of the programme there could only be twenty moneys, though the entries ran up to 210. Of this number thirty killed straight and took all the money, which netted each \$70.30, as all the straight men favored a division of the purse. However, it would have been impossible to have shot it under other conditions, as the programme required the event to be disposed of this day. It was growing rapidly dark when the last round was shot.

No less than fifty-one of the principals scored 11. In not a few cases these losses were birds that ten dead out of bounds. Seventeen finished with a total of 13, and two with 12. One hundred and ten of the contestants withdrew, as it was obvious that nothing but straight scores could pay.

The following are the straight men who shared in a division of the money: Hallowell, Riley, Valentine, Dr. Kibby, Roll, Lane, Barto, Sperry, Sweeney, Marten, Johnson, Crosby, Dallas, Voris, Le Roy, Teipel, J. A. R. Elliott, Francis, Stubener, Grimm, Dicks, Bingham, Klein, Zewerg, Burgess, Popham, Wood, Elliston, Post, Milner.

The men who killed 14 are: Brewer, Brucker, Kirkover, Stockton, Parmelee, Vincent, Lafin, Worthen, Cockerill, Merrill, George, Budd, Money, Hickman, Gottlieb, Fulford, Van Alen, Malone, H. Dunnell, W. Dunnell, A. S. Miller, Green, Jr.; Hicks, Samuelson, Geikler, Jim Jones, Dr. Williamson, Mayhew, Kilbourn, Gambell, Hutching, Lyons, DuBray, Rockwell, Clay, Browall, Ivins, Mosher, Stockwell, Dunston, Stoddard, Woodruff, Perrine, Donley, Martin, Claridge, Capt. Bunk, Schemmel, Dr. Knowlton, Hunewell and Sampson.

The men who killed 13 are: Sumpter, Chase, Nauman, Harbaugh, Atkinson, Sporting Life No. 1, Deiter, Remsen, M. S. Rice, Plankington, Capt. Wooley, Tully, Moffett, Barker, Hoocy and Faurote.

Those who killed 12 are: B. Dunnell and G. H. Ford.

The list of those who did not finish follows: Denny, Fanning, Jackson, Kirshner, Callison, Gay, O'Brine, Heikes, Collins, Farmer, Norton, Welch, Burkhardt, Alkire, Loomis, W. Miller, Hyde, Studley, Young, Shaw, Capt. Money, Peterman, Anthony, Stone, McVey, Marshall, Harrison, Appleby, Banks, Carter, Clark, McKinn, Quimby, Shaner, James, Morley, H. Ford, Glover, Shuler, Waddell, Mosby, Dave Elliott, McKey, Landis, Merrier, Paterson, Wagner, Dr. Smith, Burrough, Heilman, Walker, U. M. C. Watson, Mark King, North, S. Hoffman, F. Stannard, Gilbert, Holden, Ballenstein, Palmer, Van Martin, England, Cashau, Packard, Rawhide, Sherman, Coleman, Trumbauer, Bryan, Buckwalter, Dr. Carver, E. S. Rice, Meidroth, W. M. Thompson, Lilly, Dering, Macarney, Fallis Fawcett, Brady, Werk Jack Parker, Arno, Nicholson, Sedam, Dupee, Schortemeier, Stoddard, Hildbrandt, Belloff, Lee, Hlassinger, Geoffrey, W. L. Smith, Murheid, Creighton, Speer, Hicks, Moore, Courtney, Cullom, Hegeman, Jr., Puck, Dickey, Zwerline, Appgar, The Count, Rattle, Weller and Bender.

The Grand American Handicap.

Two full days and part of a third were required to finish this great event, with its 266 contestants. There was no dawdling at the hour set to begin. Promptly at 9 o'clock each morning Manager Shaner started the competition, and it continued from that time on till near the end of the day, when the light began to fade.

The weather on Wednesday, in the forenoon, was dark and cloudy and raw, with a little sprinkle of rain betimes, yet not enough to interfere with the shooting. The wind blew stiffly from the south and southwest. At noon the weather cleared up and the conditions were not unfavorable for good scores.

On Thursday, a stiff high wind blew from the west and north of west all the forenoon, bringing disaster to many a shooter, for the birds started for the boundary with astonishing swiftness, and even when hit full and fair went out of bounds with the carrying force of the wind. No. 3 set of traps were considered the most difficult, for there the wind blew straight in the shooters' faces. Often after the first barrel was fired the residue of powder blew back into the shooter's eyes, obstructing a clear second shot. The birds, springing from the traps against the wind, would swirl up high in the air, and many times, though fairly hit with both barrels, would be carried yards back of the dead line, sliding smoothly out as if they were going down a steep inclined plane. These few hours of wind made a severe change in the situation. Bird after bird was lost, thereby putting many out of the race, ending many promising hopes when the morning began.

On Wednesday, when the day ended, the twelfth round was shot up to the two hundredth man. On Thursday the twelfth round was continued, and when the shooting for the day ended all was finished up to the twenty-fifth round, so that each man had but one bird to shoot at on the following day to determine the moneys if the ties were not shot off. Afterward, there was then only the final ties to shoot off for the cup.

Considering the large number of contestants, a remarkably small number made straight scores even early in the competition. Even in the early rounds shooters began to lose birds to such an extent that at the end of the twelfth round only forty-five men were straight; at the end of the fifteenth round thirty-one were straight; at the end of the twenty-first round nine men were straight; at the end of the twenty-fourth round seven were straight.

There was a large attendance of visitors each day, said to be

the greatest ever present at any previous shoot held at Elkwood Park. Many ladies were present to witness the sport. The gentler sex was also represented in the list of competitors, three ladies, Mrs. P. H. Murray, of Sullwater, Minn.; Mrs. M. F. Lindsley (Wanda), of Cincinnati, O., and Mrs. W. C. Shattuck, of Minneapolis, Minn., showing that skill at the traps is not the exclusive property of man.

In a great event of this kind there are a few who work while the many are having sport. There was a selected staff of specialists. Each man was chosen for his special fitness in the office which he filled. Mr. Elmer E. Shaner, the manager, conducted all the multitude of details with the skill and forethought which always mark his management. All the intricate machinery was completed before a shot was fired. Notwithstanding the wide difference in the duties of the force employed, the managerial system was so complete that no matter how fast the shooters finished their turns at the traps, the records were up to date, and all the parts worked together in a harmonious whole. Mr. Shaner was constantly alert, here and there and everywhere, guarding against delays and straightening out any little kinks in the free running of the great event. To keep 266 shooters following each other in succession around three sets of traps, and to keep all the collateral details in running order is no small task. A serious error anywhere could easily throw the whole shoot in confusion. Mr. Shaner's work was so complete that he won greater laurels as a manager, and proved beyond question that he could cope with a tournament, however great might be the number of entries or the interests involved.

The office of compiler of scores was filled by Mr. Edward Banks, who has had that part in charge in the three past handicaps, and each time handled it with signal success. The large number of entries and the rapid manner in which the shooters finished their turns at the score made a great amount of work for his office, but did not impair in the least the routine efficiency of it. He was assisted by Mr. John D. Regan, of New York, an expert in this line and thoroughly proficient from having filled the same office in the past in connection with this event and from having also acted as scorer, cashier, etc., in many shooting events about New York. The entry clerks in the scorer's department were Mr. J. K. Starr, of Philadelphia, and Mr. Paul R. Litzke, of Little Rock, Ark., both of large experience in every detail of conducting a tournament. Besides having charge of this department, Mr. Banks was the Association's press representative, and was expected to answer a volley of questions at once without interfering with his routine work. He shot in the handicap also. With so much care on his mind, it is a wonder that he made the excellent competition which he did.

The cashier's department was most ably conducted by Messrs. A. Meyerhoff, of New York, and Mr. L. Lautenslager, of Pittsburg.

Mr. W. H. Palmer, of New York, was watchman; Mr. H. F. H. Dressel, of New York, was gateman, and Mr. J. McGraw, of Long Branch, was messenger.

At No. 1 set of traps, Mr. Edward Taylor, of New York, was referee. He acted in the same capacity in this event last year and is a veteran in skill and experience and integrity. Mr. J. Vone Emmons, of Long Branch, N. J., was scorer at this set of traps.

At No. 2 set of traps, Mr. Harold Wallack, of Long Branch, N. J., was referee. He also has officiated in this event for years past, and he, too, is a man of skill and experience and integrity. Mr. A. A. Fink, of Reading, Pa., well known as a manager of shoots in his State, acted as scorer at this set of traps.

At No. 3 set of traps, Mr. Bernard Waters was referee. Mr. Howard Gray, of New York, was scorer.

The squad hustlers were Mr. W. J. McCrickart and F. DeVigne, a most exacting office, of infinite labor, for on them depended the warning of the indifferent, the hurrying up of those who lagged, and a general keeping up of the line of shooters, who began at No. 1 set of traps and finished at No. 3.

Each shooter bore on his back a large card, on which was marked the number which preceded his name in the list of shooters, and which designated the order in which he shot. On it also was marked the shooter's handicap. Thus, a card marked "No. 2, 28yds." denoted that the shooter shot after No. 1, and that his handicap was 28yds. Printed lists could be obtained on the grounds, and on these were the names of all the shooters, their addresses and their numbers in the order of shooting. The identity of any shooter thus could be easily determined by referring to his corresponding number in these lists.

Each shooter began at No. 1 set of traps, thence walked to No. 2, where he shot his next bird, thence to No. 3, where he shot his third bird, and then he retired till his turn came again, which between the first and second round was after an interval of about three hours, a most trying wait to those who were fretful or nervous, or both. As the rounds were shot off, and as the shooters were dropped out and the number consequently grew less, the wait between rounds grew less, though on the other hand the strain grew greater with many as the competition neared the finish. The long wait between rounds was the sole irksome feature of the shoot.

As to the manner of keeping the scores, each scorer was provided with a set of score sheets, which was a duplicate of those in the hands of the other scorers. Let us suppose now that the shoot has just begun. Then each scorer uses the first sheet, which has printed on it the names, numbers from 1 to 25, and handicaps of the first twenty-five shooters. When the shooter has shot at No. 1 set of traps, the scorer records his kill or miss, and Nos. 2 and 3 in turn do the same. When the shooters from No. 1 to No. 25 have shot, the messenger takes the three filled score sheets to the office of the compiler of scores. The sheets are marked 1, 2, 3, and when placed side by side in one two three order the three shots of each of the twenty-five men are seen at a glance. The entry clerk copies these sheets to the main sheets, which are tacked down over a large area of desk. In the meantime the scorers have taken up the sheets numbered from 26 to 50, inclusive, and when these are filled they are sent in as before, till the round is finished, when a new set of score sheets are taken in hand and the scorers proceed as before. When the shooting has advanced to a stage where men are dropped from it, a heavy blue pencil mark is drawn through the names of such as have missed enough to preclude their winning, and thus the scorer at the traps knows that he need not call up those whose names are thus cancelled.

The party from the West came in a special train of seven

OFFICERS OF THE INTERSTATE ASSOCIATION.

O. D. DELANO,
of LeRoy Shot and Lead Works.
Member of Club Organization Committee.

CAPT. A. W. MONEY,
Pres. Am. E. C. and Schultze Powder Co.
Member of Committee on Rules.

ELMER E. SHANER,
Manager.

ED. TAYLOR,
of Laffin & Rand Powder Co.
Member of Committee on Rules and
Referee at No. 1 set of traps, G. A. H., '99

IRBY BENNETT,
of W. R. A. Co.
Vice-Pres. of Interstate Association
and Chairman of Tourist's Core.

A. W. HIGGINS,
Sec. of Laflin & Rand Powder Co.
Director and Member of Executive and
Tournament Committees.

EDW. S. LENTILHON,
of E. I. Du Pont de Nemours & Co.
Director and Mem. of Tournai Com.

CAPT. J. A. H. DRESSEL,
of U. M. C. Co.
President Interstate Association and
ex-officio Member of all Committees.

JNO L. LEQUIN,

Sec'y Interstate Association and Member
of Tournament Committee.

cars, luxurious in their appointments. The train consisted of a B. & O. baggage car, the Pullman buffet and supply car Atlantic, with barber, buffet and attendants; the exposition dining car America, with four cooks, five waiters and one steward, this car having a seating capacity of forty, and was a part of the Pullman exhibit at the World's Fair; the compartment car Guiana; the standard Pullman Tartary; the section Pullman Persia, and the standard Pullman Vilame. Most of these shooters were distinguished by a neat-fitting corduroy coat and a felt hat, in style similar to that worn in the regular army, and decorated simply with an aluminum pigeon bearing the legend "Dupont." They were a fine body of men, and it is unnecessary to dwell here on the excellence of their shooting, for the records show it. The train was side-tracked near Branchport, within a short distance of Elkwood Park, and made most comfortable quarters for the shooters. To Mr. E. S. Rice is due largely the credit for accomplishing such a remarkable undertaking, and bringing it to such a successful conclusion.

The conditions of the Grand American Handicap were: Twenty-five live birds, \$25 entrance, birds extra; handicaps 25 to 33yds; \$1,500 guaranteed by the Interstate Association and all surplus added. High guns; not class shooting. A sterling silver trophy and \$600 to first high gun, \$500 to second high gun, and \$400 to third high gun. All money received in excess of the guarantee was divided in accordance with the number of entries received on the basis of three moneys to each ten entries up to 260, all moneys in excess of \$6,500 to be divided into 63 equal parts and added to the different amounts won by the 63 high guns. The full provision for the division of the moneys was published in FOREST AND STREAM of Feb. 25, this year.

The scores follow:

WORK AND PLAY.

THE letter printed elsewhere from Mr. S. R. Harris, is characteristic of very many of those which come to us, because it expresses the peculiarly pleasant relations existing between the FOREST AND STREAM and its readers and contributors. By a happy coincidence, on the very day that this letter was received from a member of the Bar of Ohio, our Tennessee contributor, who writes over the name of Lewis Hopkins, who also is a member of the Bar, and whom happy fortune had brought to New York, related how the FOREST AND STREAM, with its stories of the experience of others and its promptings to him to tell his own, was the chosen favorite diversion which came to him in the week of labor. These two expressions are, as has been said, characteristic of the paper's relations with its readers and of the peculiar office it fills of the busy man's companion.

Some who are outside of the craft and have not the clear knowledge which comes only with initiation into it, might scoff and sneer at the designation of a sportsman's paper as a special journal of "The Workers." Yet he must be downright ignorant and stupid who in this day confounds the typical sportsman or angler with the idler or the sluggard or the ne'er-do-well. The truth is that they most value the rod and gun, who find in the use of these implements diversion and recreation from the routine of toil. The most enthusiastic sportsman is quite likely to be one who finds but scant opportunity to indulge his favorite pursuit, who must needs plan and contrive far ahead for his vacation, and make the opportunity for it by plotting to steal time from crowded calendars; and who, when he writes of it for others to read in the FOREST AND STREAM finds in such recording a grateful realization anew of the actualities of the trip.

The typical sportsman is the professional man who is engaged in the round of his profession, the business man immersed in affairs, the farmer, the student, the public official, the mechanic—the man and the men who are doing the world's work to-day and doing it all the better because they have learned that play too has its proper place in the economy of efficient work.

We hold the theory, not here broached for the first time, but advanced before and confirmed and established by fuller observation, that those who make the most out of their outings in the field, on the waters, in the woods and in the mountains, who get the most from their day off, their week or their month, are they who have to plan most closely how they may break the chains which hold them to their daily rounds, and how by contriving they may achieve the opportunity for the vacation short or long.

This is what gives field sports their dignity and worth, and causes every reflecting and right-thinking person to be jealous for the preservation of the game and the fish and the forests and the streams, the bird covers and the haunts of trout and bass.

HUNTING KNIVES.

THE question of the form and material of the most useful hunting knife is a subject which, while it is one which presents difficulties to the novice, is not likely to occupy a large place in the thoughts of the man who has had experience. He who is buying his first hunting knife, however, imagines that a great deal depends on it, and that unless he provides himself with a knife of proper appearance, his equipment is by no means complete.

As has often been said, the hunting knives sometimes sold in the gun stores are an abomination for general purposes. This is natural enough, since they were never made for general purposes nor for the uses to which the American hunter puts the knife. They are a modification of the dagger of the Middle Ages, a fighting weapon, which was a part of the equipment of every knight, squire and man at arms, and they were used by the huntsman for a single purpose only, that was to give the game its *coup de grace* and to bleed it. In other words, this knife or dagger was a thrusting weapon. In those times and in those places the huntsman never wished to do more than to secure the game. The operations which we call butchering and skinning were left to the servants and the followers of the hunt. But in our land and in our time, the hunter must not only kill his game, but must also bleed it, disembowel it, remove the skin, cut up the carcass and carry it in whole or in part to his camp. For such work he needs a knife adapted to a variety of operations. It

must have a point for ripping, a broad, round edge for skinning, a light thin blade, short enough to be comfortably handled. Finally, it must be hard enough to retain an edge, yet tough enough not to break if it is sharply brought against a bone.

The varying opinions expressed in our columns, and the different shapes of blades there shown, offer a wide range of choice for the man who has had a delicate taste in hunting knives. No part of his outfit is more essential to the hunter's comfort, if he is in a good game country. We confess to having a strong liking for a knife which exactly suits us, but we acknowledge also that it is often the case that those who are most finical about their hunting knives are the ones who have the least use for them.

WALTON'S ANGLER.

ONE may become the possessor of Izaak Walton's "Compleat Angler" in return for the expenditure of the sum of ten cents, or of ten dollars, or of ten hundred dollars. What he gets in exchange for his money in each several transaction is Walton's Angler; and if one buys simply to read what Walton wrote he may find it as completely in the cheap copy as in the expensive. But even for the purpose of reading one likes to have an author in respectable and worthy dress. An extremely cheap book, that is to say, one which is cheaply made in material and workmanship in imitation of a more costly one, is an abomination which grows more and more abominable with time; just as on the other hand a fine edition is cherished the more dearly the longer one has the joy of its possession. The safe rule in buying books we intend to keep is to select substantial well-made volumes, honest materials used and artistic and dignified in the printing. And if the style of the volume in its material part shall comport with the character of the subject, the writer, or the time of its original publication, the outward dress being thus in harmony with the inner soul, so much more surely may the reader enter into the spirit of the author. Your Walton need not be an early edition—there are not many early editions left, and those that exist belong to the owners of long purses—but if it shall have something of the antique air answering to the quaintness of the book itself, an edition for instance like that of the Temple Classics, the reader may get much nearer to Tottenham Hill, than he will with some other copy, even though more stately and luxurious in dress.

Book buying is like angling. It means different things to different people, and has in it a multiplicity of gratifications answering to varied tastes and various desires. No hard and fast rules may be laid down for book buying, no more than for trout fishing. No particular motive may be prescribed as the only permissible or worthy impulse. Nor may we quarrel with another because the pleasure he finds in his books or in his fishing is not the pleasure we discover in our own. Most of us buy books as we catch fish, for the double purpose of food and entertainment. There are those who invest in books together with rugs and paintings and bric-a-brac for house furnishing, without ever knowing what is inside the covers; and as little does the conventional angler, the fisherman to be in fashion, ever get at the heart of angling.

There was sold at auction in this city last week a copy of Walton, which brought \$2,870. It was not one of the first editions, but that published by William Pickering, London, 1853. The Pickering edition, in two volumes, was an imperial octavo, published in parts, as a subscription work. It was a superb edition, elaborately illustrated with engravings on steel and copper, and voluminous in notes by the editor, Sir Harris Nicolas. Westwood, in his "Chronicle of the Compleat Angler," describes it as "one of the handsomest publications of modern times, an ornament to the angler's library, unique of its kind, and perhaps destined to remain so." The copy sold in New York last week had been extended by the insertion of extra illustrations from the original two volumes to seven; it was beautifully bound in green crushed Morocco, and each volume was encased in a chamois-lined case. It was the book in the collection, that of Mr. Henry F. Cox, which excited the most lively competition and brought the highest price.

The inserted plates numbered 1,762, and when it is considered how many other works in various branches of literature must have been rifled of their illustrations for the enrichment of this one, and how rare were many of the prints secured for the purpose, we may perhaps conclude that the seven volumes cost Mr. Cox in their

making more than he realized from them at the sale. The task of collecting the materials must have consumed years of patient searching and acquiring, with much haunting of print shops and delving in many fields of book making.

Walton is one of the works in all literature which lend themselves most graciously to the pursuit of the extra-illustrator. Not to begin to catalogue the various classes of illustrations which might be drawn upon for the purpose, there are the portraits of Walton and his friends and contemporaries, and of the numerous personages mentioned by him, with the good anglers of all times and all countries, from Genesis to FOREST AND STREAM; the fishing localities named, the fishes themselves and their relations, the sports of the time, hawking and hunting, with the hawks and the dogs and the horses and the paraphernalia of the chase, the trees and the birds and the flowers and the flies and the baits and the tackle, and fishing scenes without end, as one may quickly discover for himself, if ever the print collector's passion shall lay hold upon him. An astonishing range of subjects and undreamed of wealth of material will unfold themselves before the devoted mortal who sets himself to the task of illustrating Walton's Angler; we may not believe that Mr. Cox, with the 1,762 illustrations of his copy, had anywhere nearly exhausted the field; but we may at least give him the credit of having made a good beginning.

SNAP SHOTS.

Mr. Orin Belknap's recent call for gun-flints for his Hudson Bay antique developed the fact that the flints are still manufactured and dealt in for the supply of flint-lock gunners. This is an age of breach-loading percussion systems; and yet one has but to step just aside from the full swing of modern progress to discover that there are still thousands of muzzle-loaders used in the United States by classes of shooters who could ill afford the more costly breach-loading mechanism, ridiculously cheap though it be. In some other countries the muzzle-loader is the common and conventional arm. Our consul at Asuncion, Paraguay, Mr. Ruffin, reports large importations into that republic of shotguns with ramrods, which sell for from \$3 to \$6, thus, so cheaply, that a good American shotgun cannot compete. Our South American sporting brother is behind the times with his powder-flask, ramrod, wadding and cap—so far behind that perhaps by the time he catches up with our present perfection of the hammerless breach-loader with smokeless powder, we ourselves may long since have passed beyond it with our liquid-air guns.

For the first time in its history since a fish commission was established, New Jersey is this year without an appropriation for fish stocking. The situation is due to the Governor, who is consistently hostile to the fishing interests of his State, and whose attitude with respect to fish and game protection is determined by his petty personal piques and prejudices rather than by any conception of good statesmanship or any appreciation of wise economy. New Jersey has in recent years administered its fish and game affairs in a business-like and effective manner; the fish commission has given the people a return for the moneys expended, and the wardens have accomplished a vast reform in the efficiency of the protective service. We of other States have been accustomed to point to New Jersey with some satisfaction for a demonstration of the possibilities of an intelligent conduct of the affairs of a fish and game commission. The State was doing good work, and the commission should have had the usual appropriation this year to continue it.

Michigan's Governor has yielded to the demands of the spring shooters and has signed the bill to permit killing wild ducks to May 1st. This retreat from a place in the advance of wise game protection is a step which will be generally regretted; but the sentiment—or rather the common sense conviction so widely held—concerning the folly of spring shooting will not be weakened but intensified by the reactionary movement. The spring shooting of migratory birds is something which in the very nature of things must be stopped, and will be stopped; and the general movement toward that end may not be stayed by the defection now and then of an individual State.

The Sportsman Tourist.

Comrades.

WHEN one gets to the last quarter of his journey he is apt to look backward more than forward, for the further end of the path, half veiled in the misty glow of sunset, is pleasanter to look upon than the untrodden, uncertain path that lies before him. Seen through it the wayside woods bloom with rare flowers, the roughness of the path is smoothed whereon the companions of our youth walked glorified as in a halo. Where are the forms whereof these are but the shadow? Some are still traveling divergent paths, some asleep in the green tents by the wayside where their journey ended, the green roofs dotting the way far back into the filmy perspective. But a little way behind, his weary journey ended, sleeps one who was always my chosen companion in those happy days of youth, when the world was fair around us, the sky was blue above, and there was no thought for the morrow but that it would dawn as brightly and be as full of sunshine. It is a long lesson to learn that the present is always the best, and happy are we in being such slow learners; so, hopeful in our ignorance, when it were folly to be wise. We were comrades of rod and gun—the same fire of pine roots lighted our nightly fishing; when one went shooting the other went also, and all the livelong sunny April day we loafed on the level margin of the Slang, potting pickerel and muskrat.

I well remember one such day, a Sunday be it whispered, when all loafers beside us were abroad. How warm the sun shone, how soft the April air, breeding laziness in all things save the pulse of nature. Treefuls of blackbirds dribbled down their medley of harsh and liquid notes, the frogs purred in endless monotony, rows of little painted turtles basked on every slanted log, wild ducks swam safely in the distant midstream, from some far sequestered cove came the watery booming of a bittern, the spawning pickerel swam lazily in the sun-stepped shallows of the marsh, and these we sought with eyes intent and stealthy step and guns at ready. With like purpose, over against us on the Slang's further shore stalked the grim old Drum Major, an attache of the Champlain Arsenal, where he had borrowed a heavy Colt's revolver, then a novel arm. The Major was followed by his nephew John, a tall, lank youth, very proud to be in the company of so distinguished an arms-bearer. Whenever they met other fish-hunters the strange weapon was certain to attract attention, and then followed examination and question, after which Jack would ask, "How much did that ere pistil cost, Uncle?" and the Major would answer with solemn impressiveness, "Faw-ty dollars." Then came an awed silence, until another party was met, when another inspection was made, and Jack would ask, as if for the first instead of the twentieth time, "Haow much did you say that ere pistil cost, Uncle?" "Faw-ty dollars!" Long after they had passed out of our sight we heard again and again that solemn response echoed along the wooded shore, "Faw-ty dollars!"

We met Oné Justin, the old Canadian, with a nose like a Brobdignagian strawberry and an ancient Queen's arm, charged like a cannon. He would empty it at a muskrat, but not for the reward of a single duck. Eighteen black ducks killed at one discharge of his ordnance was his crowning achievement. Oné Justin had a little red spaniel that was said to dive after muskrats and often catch them. There was a vagabond of a shiftless trapper making the round of his traps in a cockleshell skiff, singing tunelessly the song of "Old King Cole," and there were fish-hunters in the tottish log canoes that are now extinct. Long ago their navigators made their last voyage to known ports; for them and for me and my comrade there are no more happy days of lazy loafing about the Slang. Long ago our ways parted, and since we were boys we have never wet line nor pulled trigger together, and he has come to the end of it all.

There were other comrades of field and forest, but all are gone, some to the end of their journey; others are yet afoot, but far away. Old Jim was my first duck-shooting chum. Quaint of speech, of a racy, native humor, and always good-natured, he was a right pleasant companion, for all his queer notions. He would not use paper for wadding because it weakened the force of the shot. Tow was his first choice, wasp nest second, and if neither was to be had, then linen or cotton rags, of which there were always plenty in his household, if not always to spare. Sunday was his only holiday, and then, when we should have been at our devotions, we prowled along the Slang, and coming to the John Clark place would ensconce ourselves behind the screen of drooping oak boughs and await the incoming of woodcock and teal, routed from the creek by other ungodly gunners. Far away the booming of a gun would echo along the wooded shores; then our eyes would catch the thin line of incoming flocks against the sky; it would grow to separate dots and the sibilant beat of swift wings, throbbing but little quicker than our hearts, would become audible, and then, with a long downward slant and a reaching down of webbed feet, the flock would surge into the currentless channel before us. No rest for them here, for at the counted word we let drive our two charges into the thick of them, and springing to flight with tremulous squawks and prodigious splashing, the harried flock would start again in quest of some safer retreat and we would gather in our victims. Jim's iron-banded and battered relic of 1812 rarely spoke but to pronounce death sentence. Good, kindly, old, toil-worn, poverty-stricken old Jim. I am sure the recording angel set down naught against him for these few bright days in his weary life. Dearest of all comrades was the boy whom I first taught to shoot, whose first hook I baited, to whom I imparted my meagre lore of woodcraft, and in whose youthful imagination I held a place with Leather Stocking. In manhood he became my chosen companion, most beloved of all men, brave, tender and true. Alike in our tastes and our love of nature, it was our daydream of earthly enjoyment to renew our youth beside the old streams in the shadows of the old woods, a dream, alas, never to be realized. Cut down midway in life's journey, he left the world the poorer for his loss; and me alone, stumbling along

the dark pathway. Crueler than death, sadder than separation, is estrangement, that hardens the hearts of old friends against one another. Happy am I that this cold, black gulf never yawned between me and my comrades of the old days. Sometime, somewhere, in that undiscovered country where their kindly spirits abide, shall we find a happy hunting ground, where an endless Indian summer broods on the celestial hills, where, with the shades of guns whose like are made no more, and with dogs whose like dwell not now upon the earth, shall we hunt the ghosts of game that has no close time?

ROWLAND E. ROBINSON.

Old Derry.

"Let it be book'd with the rest."

—Shakespeare.

ON a visit to the neighborhood of my early home a year or two ago, I ascended the lofty hillside above Ridgeview Park, and from the coign of vantage afforded by an abandoned road looking down, I saw at my feet an extended landscape. It was mainly old Derry township, a region that I was more or less familiar with in my boyhood, but which I had not visited except to ride through it on the line of the railroad for many years. A hundred recollections, not all of them cheerful, crowded into my memory at the sight. In the distance were the river, hills along the Conemaugh, and I could distinguish the localities that lay about my native town. To the left and several miles distant were two detached peaks or knobs that I had not seen for more than two-score years. In fact, I think I never saw them but once in my life before, and that was when I was a small boy. I had been with my father and some other persons out on the lower slope of the Ridge to get fox grapes, and in the evening going home we passed along a road in sight of those hills, but they were far away to the west. A heavy rainstorm was off in that quarter, and we had a good deal of apprehension that we should be overtaken by it; but it passed off, and did not cross our path. My father, I remember, called those two hills Camel's Hump and Sugar Loaf. I did not know then, and I don't know now, whether those were names by which the hills were commonly known, or whether, as I rather suspect, was the case, they were names that he himself applied on the occasion—reminiscences of his early home in the Connecticut Valley in Massachusetts. Anyhow, I have never heard those names since, as the appellations of hills in that section of the country. But there they were now, unaltered in appearance in the slightest degree. Change and decay and death had been widespread; but the everlasting hills were unscarred, and lifted up their vast bodies in the blue of the horizon as calmly as of yore.

In the immediate foreground I recognized after a little a house at which I had spent some time when a boy of fourteen years. What I best remembered in connection with that place was that one night while I was there, there came up what I still think was the most terrific thunder storm that I have ever known. It was so alarming that everybody in the house got up, and all gathered in the sitting room, and my father, who was a devout man, "took the Book" and read a chapter aloud and then led the family in prayer amid the uproar. We were all thoroughly frightened, and I have never forgotten that storm.

Off to the right I could now recognize another house, where a year later I and an elder brother of mine had worked for some time. It was late in the fall of the year, and my stay there was made memorable to me by reason of two things. I there heard for the first time in my life the sound of a steam whistle. That would seem almost incredible; yet there were many people then who had lived much longer than I had, who had never heard one. The Pennsylvania Railroad was at that time in course of construction in the western part of the State, and its tracks were laid down within a mile or two of the house. From my point of observation I could see the railroad just at the foot of the slope, where I now sat, and the house off in the distance. Several times in the course of a certain very blustery and dreary afternoon there came through the woods a most unearthly screeching, which no one could account for. We were all agog. The old lady, the mother of the household, and a most excellent old lady she was, imagined that it was somebody out in the woods in the direst extremity. I remember that I remarked to her that it was impossible for anybody to "holler" like that; but she replied that if I was in the woods with a tree-top on me, I didn't know how I would holla. That was an unanswerable argument, and we were all sent off into the woods to look for the unfortunate victim of a fallen tree. We spent a good part of the afternoon in the vain search. That evening at the spelling school at "the corners" we learned that the unwonted screeching had been the whistle of the construction train on the railroad. It was a great relief to have the mystery so happily explained.

And here, if this were the proper place for it, I should like to indite somewhat anent the old-time spelling school, once so familiar an institution among us, and now so rarely heard of. How clearly at the word comes back into memory the grimy schoolroom, the half-dozen tall-low dips smoking in their tin sconces on the unpainted wall; the schoolmaster, pompous and precise, spelling book in hand; the two long rows of eager contestants; the few survivors of the struggle as it proceeds from "barter" and "garter" through "phthisic" and "bdellium" until the supreme effort is reached in "honorificabitudinanditatibusque." Great glory was his who "spelled down" the school. The home-returning hero from Bingen on the Rhine was never happier.

The other circumstance I refer to was a coon hunt in which I participated. There were four of us, two young fellows belonging to the farm, to whom, of course, the neighborhood was familiar; my elder brother and myself. I was the youngest member of the party, and a stranger to the place. We had with us an axe and a full complement of dogs. We had no gun. We expected to tree the coon, then cut down the tree and let the dogs and the coon have it out. I had no doubt that this would be very good fun. We trudged along for some time, stopping occasionally to hear if there was any report of progress from the dogs, until in the course of our tramp we unluckily came into the neighborhood of a house where

an elderly man, a widower with a family of grown-up children, was being married that very evening to a woman of suitable years. I don't know just which one of the evil genii presided on the occasion, but it was suggested that the proper thing for us to do would be to go down to the house and give the old couple a send-off in the way of what they called "a serenade." I had no idea what form the serenade was to take; but I went along very willingly. The serenade was a very simple affair; it consisted only in standing on the hillside above the house and firing stones down on the roof. In a minute the whole wedding party came swarming out of the house like a lot of mad hornets, or

"As bees bizz out wi' angry fyke,
When plund'ring herds assail their hyke."

Some big dogs were let loose and bid "sic 'em," a gun was fired, and the chase began. At the very first intimation of trouble the young farmers took to their heels, my brother could keep up with them, but I fell behind and very soon lost them in the darkness. I forged ahead, but altogether aimlessly; there was no road; it was pitch dark, and I knew not how to direct my steps. It was a dreadful plight to be in; alone in the unknown woods with unseen enemies near and unfriendly dogs sniffing among the bushes; lost, without bearing or compass; no shelter and a long, cold night in advance; wandering about, without knowing whether each step was bearing me nearer to safety or destruction; afraid to stand still for fear of being overtaken; afraid to call out, for fear of being heard by the foe.

But fortunately the pursuit was called off soon and the people returned to the house. But I did not know that, and so kept groping along in mortal terror. The prospect of spending the night alone in the woods was anything but reassuring, and if I shed some bitter tears it is not to be wondered at. I have never posed as a hero.

Fifteen or twenty minutes, which seemed an age to me, thus passed, when I heard some one walking softly among the fallen leaves. I stood still, with my heart in my mouth. Then my name was called in a low tone, and I knew I was saved. If I had been rescued from a floating plank on the bosom of the tossing sea, I could not have been happier. It was one of the young men of the farm. They had been nearly as much concerned for me as I had been for myself, and had been anxiously seeking me. The result of this foolish prank was to take all the vim out of us, and we made our way home silently enough, and the festive coons suffered no harm from us that night.

The scene of this youthful adventure of mine must have been in the near neighborhood of the spot where I sat so long afterward. The venerable hillside had not much changed. True, right below me were the white cottages and the auditorium of a stylish camp ground, and its colonnaded boarding house, a sad innovation upon the ancient demesne of Pan and the Satyrs; but still the grand old forest extends almost unbroken for many miles. The "green-robed senators" of the mighty woods yet stand much as they stood when my young eyes first beheld them. The lapse of fifty years is marked by little apparent change in a forest where the hand of the lumberman has not encroached. The solemnities of the vast woodland, its brooding calm, its sequestered depths, its flickering lights and beckoning shadows, remain little changed from age to age. I do not wonder that the ancients peopled the woods with uncouth and romantic shapes. Such was the forest described by Keats in his "Endymion":

"Upon the sides of Latmos was outspread
A mighty forest; for the moist earth fed
So plenteously all weed-hidden roots
Into o'erhanging boughs and precious fruits.
* * * Paths there were many,
Winding through palmy fern and rushes fenny,
And ivy banks, all leading pleasantly
To a wide lawn, whence one could only see
Stems thronging all around between the swell
Of turf and slanting branches; who could tell
The freshness of the space of heaven above,
Edged round with dark treetops? through which a dove
Would often beat his wings, and often, too,
A little cloud would move across the blue."

T. J. CHAPMAN.

The Sportsman's Den.

How many happy hours are spent in it. It is the one room in the house in which the master feels that he is monarch of all he surveys; one into which his dog knows he is welcome to come and snooze and pursue the festive flea without fear of being chased out with a broom in the hands of an irate female. The room is not perhaps so tidy as the best spare room, nor its furniture set in unvarying geometrical positions; but it is as the owner wants it. On the walls hang pictures of hunting scenes, one or two stately stag heads, as true to life as the taxidermist skill can do; a set of wide-spreading moose horns hang over the mantel, deer horns here and there on the walls are used as racks. The floor is covered with skins of the bear, deer, and wolf. A rack is well filled with shotguns of different makes and bores, and rifles of different calibers. On a shelf is loading apparatus. In another corner hang the hunting clothes. A center-table is littered with sporting magazines. Numerous pipes lie conveniently around. A large easy chair and a pair of well-worn slippers invite to comfort.

Many happy hours are spent in the little den. On entering its door one may leave all business for a time behind, and live over the happy hours of the chase. In his fancy he again kills the old big buck, and hears the music of the fleet-footed hounds bringing the game nearer and nearer. He is in camp again, sees the twinkling light of the camp-fire, with his comrades sitting around it. With the delicious night coming down and wrapping the little white tents about like a soft cocoon, as one by one the stars swing out their glowing lamps in the great tent of the sky.

The scene shifts, and now he is on the lakes with his 12-gauge hammerless, bringing down the mallards and blue-wings and an occasional honker. Or he is whipping the streams for the speckled trout. Again he kills the big four-pound bass that tried his split-bamboo to its utmost, and made his reel sing a merry tune. Or he is in the field in quest of quail or snipe. Thus, sitting

in the easy chair, watching the wreaths of blue smoke curling from the old briar root, he sees all the scenes of former outings, with his genial companions.

How his heart goes out to the genial comrade, how he cherishes the memories of the past outings together! How he longs for the time to come when they may share the same blanket, lounge before the same camp-fire, cast from the same boat, or face the storm together again. Some of these old friends, alas! have crossed over the river to rest in the shade of the trees.

He likes to while away a few quiet hours in the den. He loves to overhaul his traps, unpack his hunting chest, oil his reels, clean and polish his guns and throw them to his shoulder and sight them at imaginary birds. The old dog, curled up on the best rug, keeps his eye on his master, and when he sees him take up the gun, raises his head with an expectant look. He, too, loves the sport and the den with its soft rugs and cosy fire.

In this room the owner always finds things just as he left them. When he comes in tired from a long tramp he can sling one rubber boot into one corner and one into the other with perfect impunity, and it is all right—he will know just where to find them. The old adage of a place for everything and everything in its place will not do for him. He is more lavish; he has a hundred places for everything; but if no female invades his retreat with a search warrant for loose real estate, it will not take him long to locate any of his things; he seems to do it by instinct. All of the servants of the household are imbued with the idea that all who enter here with dust broom or brush are like the prisoners of the Bastille and "leave all hope behind." So, by general consent he is given that room. And he is better off there among his idols than leaning over the pool table or setting around the hotels, giving his views of the Philippine Islands, or in some quiet room having a little game "with just enough in sight to make it interesting."

There are moments when he likes to be alone, and the den offers the opportunity. Perhaps he had been out all day after game, and returned with an empty bag, after boasting of the amount he was going to bring in. The chagrin makes him feel "that there are moments when he wants to be alone." Or while fishing his boat capsizes, and he goes overboard. Wet and plastered with mud, by taking the back way he arrives home unseen. "There are moments when he wants to be alone." Or he hears that the rivers are full of ducks; he takes his headlight and spends the night after them—and comes home in the morning cold, tired and sleepy, with not a feather to show. These are moments when he wants to be alone.

C. L. BRADLEY.

Nitro.

It is only since the new powder has become generally known that his friends have found a name for him, and now, in the field or camp, he is most appropriately "Nitro." An all-round good fellow, his predominant characteristic is the ability to act before the average man has even mentally purposed. We gathered our paraphernalia for a day's outing recently, and borrowed one-half of two—alleged—good dogs. They being owned by a joint stock company, one-half of the stock being held by Nitro.

Dog number one showed faint symptoms of good points, but was too much handicapped by an excess of adipose tissue to rate high in the field. Dog number two was a "had been," sadly degenerated. We left the train at a small village in east Tennessee, and went forth to make scarce the quail that we had heard were very plentiful in that bailiwick.

A country boy of sturdy growth was found, who, for a compensation that was about equivalent to a week's reasonable wages, was willing to pilot us and show us the favorite haunt of the brown bird, which he assured us he well knew. We were out for fun, regardless of expense, and before he had time to annex the usual many conditions, or ask his fill of questions, my friend of action, and not words, had loaded him with our lunch and spare shells and started him off.

If that boy was not born tired, he certainly had developed well early in life, for it required the effort of one, and at times both, of us to get him down from every fence crossed that had a flat rail on top suitable for a resting place.

We hunted for some time without success, and with scarcely varying positions. Nitro and I trudged along side by side; the fat dog ambled along in front of us just far enough ahead to prevent our stepping on him; the "had been" wildly ranging from a hundred yards to a half-mile ahead, and frequently out of sight; and General Debility, as my irreverent friend had christened our boy, dragging along well in the rear.

Our fat canine finally fell over a rabbit, which was brought to bag by our combined efforts, not because we particularly craved the flesh of hare, but, as Nitro said, "because he will cure the lean and hungry look of our game bag, and aid in getting a little work out of General Debility." The rabbit evoked the nearest approach to an effort from the General that he had yet developed during our acquaintance; picking it up and holding it at arm's length, we heard a sigh, and looking at me, said: "Mister, he is awful heavy." This being assertion and not argument, I said nothing.

Turning to my companion he added: "And he ain't with a darn to eat." This pathetic bid for sympathy was met by Nitro with the heartless query: "Well, who is eating him." Pitching it into the game bag on top of our lunch with unnecessary violence, he "took up the white man's burden" and fell in line.

Soon thereafter the real business of the day began, and we put up a fine covey of birds. Our fat dog found them in a patch of briars, and, after several honest efforts at the conventional thing, settled down on all four feet and pointed truly, if not with grace and ease.

We each got in both barrels on the flush, and I killed three birds; at least, that was my friend's report, although I had shot at only two, and had a strong suspicion that one of the shots, at least, had been entirely out of line with the flight of the bird.

Not feeling inclined to dispute his word, I pocketed the three birds and we moved on in the direction of the

piece of where the covey had settled. Here we were just as "had been" dog, that returned to investigate it. He rushed in with an air of business, as though to make up all lost time, flushed two birds and out of sight and hearing after them, leaving the remainder with the assistance of the fat dog.

We first flushed a single, both fired, and he fell, so my companion avers.

A pair next offered, at rather a close range, only one of which we bagged, my bird bag. Three birds next broke cover, two of which stopped at our invitation, both falling to my unerring aim, according to my truthful companion, although I had found a 4ft. oak tree between me and the second bird I had tried to hold on. Either I was shooting a remarkable gun, or else there was something in my companion's reports that called for a court of inquiry.

Two birds next flushed, one flying to the right and the other to the left, and after my companion had swung to the right hand bird, I killed the one on the left, and waited before retrieving it for my companion's report.

"You got him," he cried, and walking out he picked up his bird and brought it to me.

Not until I had assured him that I had not shot at his bird at all, and showed him my dead bird lying where I had thrown him, well off to the left, would he admit that he had killed a bird.

Not finding any more of the birds in that cover, we sat down on a log to rest, and I proceeded to question my unselfish friend on his lack of success in the field; assuring him that I had seen his work at the trap, which I considered above the average.

"Well," said he, "this bird killed to-day is the third bird I have killed since the opening of last season, although I have been shooting birds for many years."

"Last season, and the few times I have been out this year, I have hunted with two gentlemen, one prominent in the professional, and the other in the business world, and they have invariably killed every bird that was brought to bag." (There was no irony in his voice, it was cold steel.)

"The other two birds I got on a hunt last season when I had promised a pair to a sick friend, getting one that they did not see fall, and the other by killing him behind me, while they were shooting to the front, and holding my finger on the trigger and threatening to lift the tops of their heads if they offered to touch it when I went to pick it up."

"They were fair enough on the divide of the game, and they were both like 'Brutus,' but they always fired when there was a flush, and they invariably killed everything that fell."

"I have promised to hunt a day with them next week and have arranged a lot of shells for the trip that I firmly believe will cure them of their bad habit and make pleasant shooting companions of them. They will shoot the regulation loads of powder, but the shot space in their cartridges will be filled with felt wads, and after they have claimed all the birds killed, I propose to produce the affidavit of the man who loads to prove that only the 16-gauge shells (they both shoot 12s) had any shot in them."

"It will be heroic treatment, and may cause temporary unpleasantness, but it will cure them, I honestly believe."

Assuring him of my sympathy, and the hope that his scheme would work well, we resumed our hunt with the understanding that he was to kill as many birds as any body else on our hunt.

We swung round and started back in the general direction we had come, and found the appearance of the country very encouraging.

But now our heretofore apathetic boy seemed to wake to life and take a real interest in the hunt.

"Better keep out of there," he said, as we started to climb a fence, enclosing a promising looking bit of stubble. "That is ole man Grubbs and he don't allow no huntin'."

"Where is his sign?" asked my companion.

"Ain't got none up, but he will raise sand 'ef he catches ye." We concluded to risk the sandstorm and entered the field. Two nice coveys rewarded our temerity, out of which Nitro acknowledged seven birds to his gun.

Another good stubble was soon reached, which General Debility tried to argue us out of hunting by assuring us that it was "boggy and full of water holes." Here the "had been" truant rejoined us, and none too soon, for his highness, the dog of aldermanic proportions, was fairly worn out.

A covey was found that flushed wild, and one was killed across a small stream by a long shot.

The condemned dog acted well on the stand, and promptly rushed for the dead bird.

We congratulated ourselves on his reformation, and waited for him to bring in the bird that we might encourage him with kind words and caresses.

He did not return promptly and my companion crossed over to investigate the cause of the delay.

His arrival at the point where the dog was located was immediately followed by some rather strong language, the thud of a vigorous kick, and ki-yis! of a pained and surprised canine.

The dog resumed his business of seeking secluded spots, and as he disappeared over a distant hill still voicing his displeasure at the vigorous objection to his methods, my companion returned bringing for my inspection the foot and wing of a quail connected by a ragged chewed frings of feathers which he reported as the only sign of the bird left when he reached the dog.

This episode abated our enthusiasm sufficiently to admit of our knocking off for lunch, and as we were convenient to the abode of the General, we dismissed him to minister to his material necessities, while we enjoyed our mid-day meal by a convenient spring.

Our faithful fat dog lay and snored all the time we were eating our lunch and my kind-hearted companion would not wake him up to eat, but gathered a nice lot of scraps and placed them on a clean piece of paper to feed him when he finally had his nap out.

We were smoking and resting after lunch when a sound attracted our attention, and turning we were just in time to see the last of the dinner that we had so carefully put aside for our faithful canine friend disappearing down the throat of the worthless disgrace to the whole

dog tribe, that had sneaked up in the rear and appropriated it.

"Get out! You infernal, base-born aggregation of perambulating sausage meat," yelled Nitro, snatching up his gun and crowding in shells with all haste.

The dog understood enough of the order to know that his presence was not desired and Got! at a rate of speed that carried him over the top of a rise in the ground about 1-16 in. ahead of the load of shot that my indignant companion sent after him.

A native now joined us who proved a friend of Nitro's. "Had purty good luck, men?" he queried.

We reported, and suggested that our boy did not appear well informed as to the bird covers.

"Well now"—said he—"I don't want you to say nothin' 'bout my tellin' you, but that boy knows every covey of birds within five miles of here, but he won't show them to everybody."

"I just been up to the house an' heard him a kickin' because you fellers would go in the fields where the birds was in spite of his tryin' to keep you out."

"He says he has some regular hunters that always employs him an' pays him big prices, comin' to hunt here day after to-morrow, an' he don't want the coveys cut up an' scattered none."

"Don't you tell him I told you, but I rec'on you will do jest about as well without him."

"Well, so long; hope you will have luck;" and off he trudged, leaving us to wonder why it was that we had not realized the duplicity being practiced by the boy all morning.

Without a word of comment my companion walked over to where he had placed his gun after his remonstrance with the dog, loaded it, and proceeded to locate himself at a point commanding a view of the path by which the boy would return.

There was too much business in his preparations, and watching my opportunity I slipped the gun away from behind him, where he had placed it within reach, and replaced it with the shells removed.

Down the path the General finally strolled, looking as pleased as Punch, and apparently ready to forget and forgive, as a well-fed man should.

He walked up to Nitro, who was looking him straight between the eyes, and said: "Well now, if you fellers want me to find you any birds this afternoon ye better be gittin' a move on ye, 'stid of sittin' 'round burnin' daylight, don't ye think?"

Tossing a coin at the boy, my friend produced his watch and quietly, but with a cold sincerity that was convincing, replied:

"You take that money and get out just as quickly as you can."

"I will begin to shoot at any piece of you big enough to draw a bead on that is in sight 30 seconds from this time."

"If you are fond of yourself, and like to live, do your best—Now Git!"

Evidently believing that he had to do with a dangerous individual the boy snatched up the money and made off at a gait that would have utterly discouraged our running dog had he been there to see it. He was well out of sight with time to spare before the limit was up.

The afternoon proved interesting and we added to our bag.

The truant dog came back to us, and though in deep disgrace was tolerated until patience again ceased to be a virtue. He raced us for every bird killed and generally won.

Finally he and Nitro engaged in a rough and tumble over a bird that the latter had killed and the former eaten.

The combatants were hidden from view by a thicket, but the sounds of the battle were plainly audible.

At first there were many and vigorous commands from the man, apparently unheeded by the dog; then thuds of a vigorously propelled boot landing on the dog's anatomy and a chorus of canine protests; the next act in the tragedy was a moving panorama of dog in swift retreat and determined man in pursuit.

The dog passed near by where I stood, scattering howls and feathers, and the man followed scattering adjectives, neither apparently aware of my presence. Then my thoroughly incensed friend, finding himself rapidly being distanced, bethought himself of his weapon.

Stopping short, he proceeded to deliver a broadside from both barrels of his gun at the dog, that caused that animal to give a vocal and gymnastic exhibition the like of which I have never seen equalled.

When we resumed operations in the field there was a look of conscience approving duty performed on the face of the man that lasted out the day, but the dog did not come back.

Our game pockets assayed 27 whole and 4 desiccated birds, when we arrived at the station where we were to take the train for home; and our faithful fat dog did not open his eyes or break a snore when we lifted him in and laid him on the floor of the baggage car.

LEWIS HOPKINS

Vermont Birds and Game.

SHELDON, Vt., April 22.—Below I give you the dates of the arrival of several of our birds this season, as compared with the springs of 1897 and 1898, which shows how very backward our present spring has been:

	1899.	1898.	1897.
Robins	April 5	March 10	March 21.
Red-wing starling.....	April 11	March 23	
Song sparrow.....	April 12	March 18	April 3.
Meadowlark	April 12	March 25	April 1.
Bluebird	April 15	March 17	March 28.
Phebe bird.....	April 20		April 8.

The dates not filled are those where we did not observe the birds until late in the season.

Regarding the game prospects, deer are getting quite common, foxes the same. Ruffed grouse appear to have wintered well. Mongolian pheasants have again without doubt winter-killed, and so far not a single flock of wild geese have been seen or heard. The ice is generally out of the streams, but not yet out of the lakes, and a few snowdrifts still remain in the sheltered ravines.

STANSTEAD.

In Cat Claw Park.

It was Nov. 7th, at 7 A. M., when Miguel knocked at my door at the hotel in Ratan, New Mexico, and told me that he could see the smoke of the train from the East coming down the mountains. Harry and Al. are on that train coming to meet me here for a hunt in the Ratan Mountains and thereabouts, and I came yesterday to meet them in response to a telegram.

So I went out on to the platform of the depot hotel to meet the boys. When the train stopped Harry jumped out and Al. followed more calmly. After him came a colored gentleman, arrayed in gorgeous apparel and loaded down with parcels—two guncases, two grip-sacks, a roll of blankets and a few other things. He sailed into the hotel with a lordly air and said: "We have come," to the clerk, who gazed at him with respect. From Ratan we drove over to Mat's ranch in Cat Claw Park. Mat and I are partners in a bunch of horses. I come down here to see the horses, as I usually do twice a year, and Mat had told me to get Harry and Al. to come down when I did, so I invited them. Harry and I have hunted together for the past fifteen years. The park is in the heart of the Ratan Mountains, and is a beautiful oval valley five miles long and three wide, surrounded by lovely mountains that glow with the dull red of the mountain oak and the bright green of the spruce pine. In the centre of the valley, on a little knoll, is Mat's ranch, a big adobe house of many rooms. It is of one story and looks like a big mud turtle. Twenty feet from the door bubbles up a strong ice-cold spring, which runs on a little rill down into the creek 200 yards away. Behind the main house is a motley collection of buildings—Mat's old cabin, where he used to live when he was a bachelor. It's the harness and saddle-room now. Carriage houses, hen house, stables, coral, cow house, smoke house, and two jacals full of Mexican herders and women and fleas and dogs and children.

That afternoon we planned a little hunt over into Colorado, and started two wagons around by the road. Al. dug up a lot of things for Mrs. Mat out of one of his trunks. She told him that she hated to take such valuable presents, but that she couldn't help it, for they were just what she wanted, and Mat looked wise and said nothing—he had sent a list of things to Al. two weeks before accompanied by a check. Al. had added a few things on his own account. That evening Al. owned up to Mrs. Nell how the things were so well selected, and she sat down very close to Mat, and without looking at him patted him on the knee, and the rest of us made believe we didn't see it, and I thought of a young woman 300 miles away that is just as good-looking as she is, and felt a trifle lonesome for a few minutes.

The next morning at daybreak Al. and I got into a strong buckboard, and Harry and Mat mounted their horses and we went over the mountain, over a most villainous trail for a wagon. Up the worst places Al. and I had to walk, and occasionally hold on to the buckboard to keep it right side up. We went eight miles across a beautiful rolling prairie on top of the mountain, and then down over big rocks and through quaking asp thickets, till we landed on a good road at the fountain head of the Trinchar. Three miles down the stream and twenty miles over rolling prairie guiltless of road or trail except the track of our baggage wagons, which we had sent on ahead, and at last we went down a very rough little hill, and there was camp, looking very home-like. It was in a little round valley, with a few cedars and one big cottonwood by a low cliff on the north side of the valley. A large water hole was close by the tree at the foot of the cliff. Al.'s new tent and my old dingy one were set up facing the south, and as we came down the hill Miguel and Roque were cooking supper at a big open fire, the four horses were feeding near the tents, and the wagons were each beside its own tent. The horses stopped grazing and whined at us as we came in, and the Mexicans went on cooking with Indian stolidity and hardly looked up when we stopped.

Al.'s tent had a floor cloth of heavy canvass stretched tight, a wire mattress on a cot bed, with new California blankets, a rubber pillow and white sheets, a tin fixing with a tank and a wash bowl combined with a looking-glass; two camp chairs and a folding table, a swing lamp and his trunk. My tent was furnished with three rolls of rather ragged blankets, wrapped up in old wagon sheets and tied up with a rope, all thrown down on the ground. We also had a tin pail full of water, a tin wash-basin and a lantern for furniture.

We had a big supper as soon as possible, and then all but Roque struck out for meat. Al. and Harry went together. Each had a new .30 calibre Winchester and a new belt, and the cartridges looked very small to me. I use a .35.90. Miguel and I each went alone. I wandered off about a mile and sat down on the brink of the Purgatoire canon, and sat there till after dark watching and waiting near a deer trail for the deer that did not come. I heard two shots not far from camp that I thought were fired by Al. and Harry, and finally the darkness came and I went back to camp. A big fire was burning in front of my old tent and the boys were all there.

Roque was broiling deer ribs on the coals, Al. and Harry were in Al.'s tent, that was so brilliantly lighted that it looked as if it were afire, and Miguel was just in. Al. had killed a yearling buck and had carried it into camp on his back, while Harry had toted the guns. Miguel smiled an expansive smile when he saw me, and said: "Senor Dick, I saw a big flock of turkeys, and followed them till they went to roost in some pines down in the Purgatoire canon. We will go down and get some pretty soon; but first I am going to eat some ribs."

In a few minutes we were eating ribs and tortillas and drinking strong black coffee, for it's a tough trip down into the cañon at night, and one needs to be reinforced. Also, let me inform you folks, deer ribs, as they roast sputtering and popping before an open fire, smell very good, and taste as good as they smell.

Al. concluded that he wouldn't go two miles, and down into a cañon 2,000ft. deep in a dark night to kill a turkey, so he told Roque to take his shotgun and he would keep camp in our absence. It was very dark, and crawling down into the gloomy cañon, down a deer trail part way, and then down the side cañon along the side hill through a very poky bear and mountain-lionish hole, would not have been nice alone; but the five of us were perfectly satisfied, and we finally reached the trees

and got under the turkeys and located them. I had a shotgun—12 Winchester lever gun—and missed with the first barrel. I shot where I thought the turkey's head ought to be, and shot over him; and hit him at the second shot. So down he came almost at my feet, and went fluttering and rolling down the hill. I finally heard him stop away below me and followed his trail down by lighting matches and seeing a little blood and an occasional feather, till I found him stone dead in a hole under a big rock that looked like a bear den.

We finally all came together down on the flat in the cañon. We had only three turkeys, but it was very dark and we had had bad luck, that's all. Mat had a notion to stay till morning and call them, but I didn't feel like playing freeze-out around a fire all night without blankets; so we finally started for camp, and got there about 11 o'clock very tired and hungry again. I am ashamed to tell so much about eating, and yet I must plead guilty to eating five big meals that day.

We sat around the fire a long time, and Roque told of the Thing that came down from the mountain and killed his dogs and made him hole up in the house after dark, and hung around just out of sight, and whined and moaned as if it wanted to eat him and Luce, his wife. He said it was a demon animal and a bad spirit, but when he wound up the tale by telling how he finally got it to take a bait of liver with half a bottle of strychnine, and that it went away and never returned we all breathed easier, and Miguel said that he would like the demon's skin tanned right now, as he was short of bedding. Mat and I immediately responded, and lent him and Roque two blankets and a heavy quilt.

Mexicans and old mountain men have lots of queer and grizzly stories of things—things that are seldom seen but often heard; that kill men and defile their corpses. But Miguel is intensely practical and as brave a little man as ever lived; besides he has a witch for a mother-in-law, who worries him greatly monkeying with spirits and playing solos on her medicine drum at unseasonable hours of the night, and that makes him very uncharitable. The old lady is a Navajoe Indian, and I am very fond of her; but she is a great trial to Miguel. I once offered to take her home with me and keep her, but Miguel said she would drive my wife crazy with her drum and her ghosts; that besides she would wear men's pants and ride a horse (como un hombre) like a man, and that finally she was a cross he had to bear, and that he hoped to be forgiven all his sins if he stood all her capers, and I concluded he was right both ways. Mrs. D. said Miguel had good sense when I told her about it.

The coyotes laughed and squealed and howled over on the hill where the deer offal lay, and a big owl sat on a tree nearby and occasionally said "Whoow-whoow" in a bass voice, as if he had a bad cold. Miguel growled and said, "There's nez's owl taking care of us," and we all turned in. It didn't seem as if I had been asleep more than five minutes when Mat pulled Roque out, and they both went to cooking breakfast and rattling pots and pans. Al. finally woke me up and asked if I was going to hunt this morning, and I said, "No; lemme be," and promptly went to sleep again, and woke up at 10 when the boys came in. Al. and Harry had seen several deer, but failed to get a shot. Miguel had killed a big wildcat, which, he said, was a small lion, and Roque had stayed at home and cooked more deer meat. We hunted, played whist, told stories and got several deer and more turkeys, and finally went home to Mat's ranch, and Al. and Harry started for the railroad and went home. In a few days I rolled out for Kansas, and here I am.

W. J. D.

Buck Ranch.

THE silent forest beside Buck Ranch still stretches away to the north and the east, beyond where we have yet wandered. Past Buck Ranch, the deserted remnant of a timber camp or two, and then only the wide forest, with its giants of sweet gum, oak and elm, o'erspreading the groves of green holly which close in on either side the winding course of the bayou.

"At the Place of the Oaks" Mr. Hough's two friends bowed the head, and no one would scoff. It would have been so at Buck Ranch. Thought is nobler in the lonely forest.

It was nightfall when I reached the lodge, after a day's ride over frozen roads, but within the great wood fires seemed to sputter and glow more warmly than fires are wont, and fatigue was soon forgotten, and plans making to find the party (who were in camp seven miles away), or stories telling of past exploits.

Next morning, on foot, I took the trail over to Big Possum Bayou, thence five miles up and across to discover the camp ground deserted. An almost untraceable wagon trail over leaves, twigs and switch cane led nearly a mile inland to where I found the tent, guarded by the two new hound pups. Several deer and parts of deer were swinging from limbs, and it was a small matter to find a piece of tenderloin about the right size and drop it among the live coals.

Soon Parker strolled in, and after a greeting said he needed help to get in the last kill—a small buck. This task was accomplished before the Captain, Mr. Stanford, and Arch came in from their morning hunt. The Captain said he had been unsuccessful, but when he found time and wasn't hungry, he would tell us about the one he got yesterday morning, and the two that he didn't get.

"Oh, but there are some big ones here!" and the tracks that we saw as we hunted away the evening and studied the woods verified the assertion.

The log fire in front of the little A tent must be piled up amply on that cold November night, and then the Captain told about the big deer that he did get, and the ones that he didn't get.

"It was so cold yesterday morning that they were not feeding much, and I had wandered a long way down the open ridge before I finally saw several dogs ahead of me.

"Getting a bunch of trees on them, I was slipping nearer; when my attention was drawn to a moving object off to the right, and there I discovered a large buck loping along a course parallel to my own. I thought at first that he had not seen me, and 'bleated'

to stop him, but he kept on, and when he came up with the does they all disappeared.

"I had followed on for a while in the direction they had taken, when all at once I heard the quick striking together of the horns of bucks fighting. I had never seen a combat of the kind, though having made frequent efforts before. So I was anxious to come within sight of them. This I succeeded in doing, by using great caution, but just as I first saw them they stopped fighting, and one deliberately walked toward where I stood concealed and stopped when within 70 or 80 yds. His breast was toward me, but I was afraid to wait for a side shot, and pulled trigger. Instantly he wheeled and ran a short distance, then fell. I heard him get up, run and fall again, and repeat the maneuver several times before he finally fell with a heavier crash than before, after which all was quiet, and I knew that he was dead.

"When the smoke cleared, here came the other buck along the trail of the first, this one approaching within 35 yds. and stopping broadside. What was my chagrin, then, to find that my lever had gotten caught and would not reload. I had been warned of this fault in the style of gun that I was using, and had seen symptoms in this gun before, but had trusted to its finding a more opportune time to misbehave.

"While the deer stood, I had to turn my back to him and pick out the eight cartridges from the magazine with my knife, consuming nearly ten minutes, during which time the buck, scrutinizing my back, had not made up his mind that I was an enemy. But when the magazine was empty and I closed the lever, the 'click' was too much for him, and he started off. I was quick enough to get a shot before he was entirely lost to view in the cane, but missed.

"That isn't all of the story yet. One of the does came. She stood and looked while I tried again to reload, but the lever now got caught so badly that I could do absolutely nothing with it, and after giving the deer assurances of her safety, I carried my lame gun toward camp, being in no good humor toward the man that made it.

"Parker went back with me to bring in the dead buck, which we were unable to lift on the horse, and had to drag to camp. This spoiled his hide, all but the head and neck, which I will mount."

A charm protected the other big buck. Captain Bradford could not find him again, and when Mr. Stanford encountered him he, too, met with a disappointment. He said the old buck looked as big as a mule, and as if he was posing for a target, as he stopped at short range and turned his full side to him. But Mr. Stanford had a two-trigger gun, and a pair of thick-fingered gloves on, and as the gloves got mixed with the triggers that he was going to pull both at once, a premature shot was fired and the big buck yet roams up and down in that locality.

Snow clouds the next day decided us to break camp after the morning's hunt. The party had secured a total of seven deer.

After a rough trip in we reposed a night at Buck Lodge. In the morning I relocated a flock of turkeys that Mr. Stanford had kindly scattered the evening before and killed a portly bird. At noon the party had begun to disband, and I sadly turned from Buck Ranch and rode toward the realms of man.

MISSISSIPPI.

TRIPOD.

The Changes of the Years.

BUCYRUS, Ohio, April 10.—*Editor Forest and Stream:* I am in receipt of copies of your paper containing my article on "Dixie and Dan Emmett," and I was much gratified with the note thereto contributed by Fred Mather. It also gratified me to keep up my friendly relations with FOREST AND STREAM. Over twenty years ago I sent you an occasional article, mostly descriptive of the prairies, streams and lakes, and sporting experiences of my own in northwestern Iowa, a new region which was just beginning to attract settlers. I then owned and still own farm lands there, where I have been accustomed to spend my summer vacations as a relief from the active practice of my profession. The feathered game has mostly disappeared before the march of civilization; and where I formerly looked over the vast stretch of prairies, bounded only by the horizon line like the open sea, we now see railroad trains, cultivated fields, harvesters, schoolhouses and comfortable dwellings, embowered amid planted trees. The beautiful lakes and running streams are still there, and you cannot find more attractive resorts than a cluster of lakes, like Okobogi, Spirit Lake, and other neighboring waters abounding with fish, in Dickinson county, Iowa, and the neighboring portion of southern Minnesota.

Nothing affords me greater pleasure than to find enough leisure to lay aside my legal papers, books and briefs, and employ my pen to communicate a hasty article to the FOREST AND STREAM. Very cordially yours,

S. R. HARRIS.

A Mysterious Shadow.

IN the fall of 1897 I was trapping and hunting on a small tributary of the Colorado River. My camp was situated on the west side of a large bluff. High up on this bluff was a large flat rock about 80 or 90 ft. square. The face of the rock looked as smooth as if it had been dressed by the hand of man. On bright days the sun shone on the rock from a little after 12 o'clock until 3:30 in the evening. Exactly at 1:15 o'clock a shadow would make its appearance on this rock exactly like that of a hunter dressed in the garb usually worn by hunters of early times—fringed hunting shirt, cap, leggings, shot pouch and gun. The shadow appeared to be nearly 8 or 9 ft. high; and it was so plain in every detail that it was hard to believe that it was not painted by the hand of some skillful artist. Now the strange part of this apparition was that so far as I could discover there was no object on the sunward side of the bluff to cause the appearance. Who can give an explanation of this strange phenomenon?

J. W. DRANE, M. D.

Natural History.

Migrations at New Orleans.

IN a perfectly normal season in this latitude, spring begins, from the ornithologist's point of view, in the early part of February, the time of the arrival of the first purple martins, and the signs of returning bird-life grow more or less uninterruptedly until the full tide of migration sets in.

That the past season has not been normal in the South is a fact only too well realized to call for any comment upon the unusual character of the weather during the winter months. But among the changes wrought by the unprecedented weather not the least noticeable was that upon the movements of the birds. The week preceding Feb. 1 was very variable in New Orleans, and while there had been at least two cold days up to the first, several days were mild enough to warrant one in expecting the first martins soon, and from Feb. 2 to 6 there was a continuation of such weather. During recent years martins have been recorded by the first week of February more than once, but none were seen in this mild period; conceding that none arrived then, an opportunity for their migration was precluded by the weather of the next ten or twelve days; during that entire time there was but one day that was the least mild, and that was the 11th, and it was on the night of that day that we had indications of the approaching blizzard. The next day snow and sleet covered everything, and a temperature of 13 degrees was recorded, falling to 6 degrees the next day.

But the indomitable mild character of our climate was asserting itself inside of three days. By the 16th the mercury had been above 40 degrees, and though there was a very chilly north wind, I saw the first grackles (Florida) assembled for their usual spring concourses and voicing their thankfulness for the approaching blessings of spring weather in those peculiar squeaky notes familiar wherever the crow-blackbird appears at this season. Feb. 18 was an example of what a fine early spring day may be in Louisiana, and the purple martin was positively recorded for the first time.

While it is natural that cold weather coming in February, the time of arrival of martins, should interfere with their movements, it does not ordinarily exercise such a great influence on the migrations occurring after March 1.

But on the present occasion one was appalled by the terribly stricken appearance of nearly every green thing about us after the cold blast. The early fruit trees and the willows had begun to bloom and leaf respectively when the cold came, and a walk in the woods on the last day of February showed them as apparently lifeless as they are ordinarily the middle of January. This setback in the budding of the trees has undoubtedly delayed a great many migrants that occur here. The first parula warbler did not appear until March 7, the time the species is common most years, while in advanced seasons the first come not later than March 1.

Of course, so late in the season trees sprouted much more rapidly than if they had begun at their usual time, and an incomplete dress of green began to clothe the hideousness of the waste of frozen vegetation. Then, with the spring showers and balmy south winds, the birds began to appear again.

March 13, as far as meager notes could show, seemed to be the first day of general migration. On that day a friend noted the first white-eyed vireo, evidently a migrant, though this species does winter here sparingly. White-bellied swallows were observed as common for the first time. They appeared in even greater numbers on the 14th, and purple martins were heard singing as they flew low over the houses. The first swallow-tail butterfly to appear in spring, usually *Papilio cretophontes*, was seen on the 14th; on the 15th two dragon flies appeared. Out of the city, my friend, Mr. Andrew Allison, observed the first hooded warbler (*Sylvania mitrata*) on the 14th.

With the weather fresh and almost fall-like on the 16th, there came a mildness and softness about the air on the 17th that reminds us what the spring is really like; at this time the daisy-like fleabane and the clover began to push themselves into prominence everywhere. It seemed the weather for chimney swifts and gnat-catchers to take advantage of, but they were looked for in vain. Martins, however, appeared to become well established, being fully a week behind time.

March 21 the first yellow-crowned night herons (*Nycticorax violaceus*) were heard at night. The arrival of these birds was the first intimation of more migrants to come after the uneventful period between the 14th and the 21st.

March 24.—First red-eyed vireos.

March 25.—First male orchard oriole and first chimney swift.

March 26.—Bartramian sandpipers passed over in numbers at night. The last days of March I spent about thirty-five miles below New Orleans.

The 29th was very cool, with north wind, but the 30th was warmer and cloudy, with southeast wind.

Forester's terns were found very abundant and noisy in the flooded rice fields, and a flock of five or six black-necked stilts was observed feeding beside two woodducks. Greater and lesser yellow-legs were common in a tract half swamp, half marsh. The first crested flycatchers came March 30, and the first kingbirds the day before. The only other migrants observed were the first Kentucky warblers and the first black-and-white warbler on the 31st. Since April 1, the season having made up a good deal of its lost time, things appear to have gone on more as in most years. April 3 the first summer warblers came; this is the usual time for them. Between this day and the 10th we experienced an unusual amount of almost cold weather for April; all through March, in fact, there had been many more cool snaps than usual.

April 9 was a cool but beautiful day, milder than it had been for several days past. There arrived the first cerulean warbler and wood pewee, and the first belated barn swallow appeared among the white-bellies.

April 10.—Birds interesting and conspicuous. White-throated sparrows singing, and warbling vireos making their customary rounds unseen through the oaks in a

well-shaded hummingbirds. Several cerulean warblers (females) in the oaks. Orchard orioles (males) plenty.

These bird notes were taken in the suburbs of the city. A trip to the woods showed that the bird wave had passed, and the first bird, though indigo buntings appeared for the first time. All the other birds were residents, as the wood thrush, Kentucky white-eyed vireo. The arrival of the first chat was noted, the date being earlier than a record of which I know. I should have least expected to find that the case this year, but there is no accounting for what the birds will do.

It should be observed, however, that the season, ornithologically speaking, made most rapid strides between the 10th and 13th, and seems as advanced now (April 20) as it ever does. With the first nighthawk on the 13th and the first but belated yellow-billed cuckoo on the 17th, there is nothing more of importance to chronicle this season, unless we have a rain followed by a cold snap, in which event any "wave" of late transient migrants that happens to be en route is apt to rest two or three days in our woods and fields.

HENRY H. KOPMAN.

Unusual Nesting Sites.

DURING my many rambles through forest and thicket in search of bird life in the last fifteen years, there have come to my notice several nesting sites that vary from those usually found. One day a lady said to me: "What little bird with a red cap on its head builds a little nest on the ground among the grasses, and has three little blue eggs with black spots near the end?"

This was a poser, so I went with her to an old orchard near her house, and under the branches of an apple tree, on the ground, was the nest, and to my surprise it belonged to a chipping sparrow that had varied her usual choice of a nesting site.

One rainy day in June, as I strolled through a large field of clover near my boyhood home, I saw a rollicking, jubilant, bobolink swaying on a golden rod, going into ecstasies over his plain brown mate and his little home tucked so snugly away in the clover, when from my feet up fluttered Mrs. B., and though I looked closely, I could see no signs of a nest. I parted the grass here and there, and was about to give up the search, when by chance I gave a piece of dry cow manure a scuff with my foot, and there under it was the nest, with seven beautiful eggs, so neatly hidden that I had nearly overlooked them.

In May, 1892, while crossing an old pasture, I vaulted over a stone wall, and suddenly, from beneath my feet, a slate-colored junco fluttered up from among the ferns, coming apparently up out of the ground. Long and diligently did I search for a nest, without finding any sign of one; but on lifting up a piece of turf that hung over a hole from which a flat stone had been taken, behold! there was the junco's nest of roots and grass, safely tucked away from the sight of any observer, and completely protected from the rain by the sod.

Wonderful to me seemed the instinct and ingenuity—almost reasoning powers—of this pretty little sparrow.

I recall one bright morning in May, 1893, while watching a pair of my favorite songsters, the hermit thrush, adding the finishing touches to their nearly completed nest, on the side of a knoll bordering on the edge of a maple wood. The nest was placed under an overhanging rock, making a shelter for the bird, as she should sit patiently day after day on her five blue beauties, and for her nestlings, as their parents should labor for food to appease their growing appetites. As I stood there I saw a small bird fly to the knoll beside this nest and remain there. On creeping cautiously nearer, I saw a small warbler on a nest, not 3ft. from the thrush's nest. Here were near neighbors indeed! I must learn which warbler it was, so cautiously working my way to the back side of the knoll, I slowly and carefully placed my hat over her, so closely did she sit, and getting her into my hands she proved to be the Nashville warbler. Was it chance or sociability that caused these birds to nest so near each other? The nest contained five spotted eggs.

While driving along a country road in the spring of 1894, I saw a flicker's head emerge from a cavity in a telephone pole that she was excavating for a nest. The pair completed their laborious task, and reared a brood of young, beside the noisy thoroughfare, undisturbed except by the annoyance of sitting for a photo, which I took of the female peering out of the nest, in wonderment at the to her strange and unheard-of performance. I had heard of some of the other woodpeckers excavating in the cedar telegraph poles, but have read of no instance of the flicker doing so.

I might also mention a nest of that pest, the English sparrow, that was recorded before (cf., Swain, Maine Sportsman, June, '97, p. 6). A nest of this sparrow containing two eggs was found in a car of flour that had come directly through from the West. The birds had entered the car through a knot-hole, and built the nest and to my surprise they were following the nest, as the birds' presence in the car attracted my attention to the nest built up over the door. This well illustrates this sparrow's persistence.

I well recall the only instance I know of cowbirds attempting to build a nest of their own.

One spring, large flocks of these birds were seen perched on the limbs of the apple trees, sunning themselves, and later, as they had paired off and scattered, I saw a pair carrying grass and feathers to a hole under the eaves of an old building, where the boards had started off, leaving a place large enough to build a nest. I watched them day after day with much interest, until the nest was completed; but whether they were just "trying their hand" at building and did not intend to rear their own young, or that I watched them too closely and frightened them away, I am unable to say, as they left the nest soon after completion, and were seen no more about it.

Another oddity was a pendant nest of the Maryland

More barn swallows, and several cerulean warblers. Several cerulean warblers (females) in the oaks. Orchard orioles (males) plenty.

yellow-throat, hung from the fork of a small bush beside a stone wall, after the manner and resembling a nest of the vireo's.

The finding of the odd nest sites as well as the usual ones has brought me much pleasure, and constantly reminds me that the Creator of these lovely creatures has scattered them about us to bring happiness and joy into our lives.

J. MERTON SWAIN.

PORTLAND, April 8.

Wild Pigeons.

THE statement that this native American bird is extinct will seem almost incredible to residents of Dutchess county, N. Y., for within a few years it has certainly been seen in that vicinity, although not in vast numbers as the old residents used to see it. Four years ago there was a remarkable flight of wild pigeons there, a flight like those of forty or fifty years ago. Hundreds were killed, and the event created no little interest. This was, however, a most unusual occurrence, in that section of the country for these latter days. In the flight of four years ago, there were thousands of the birds, and it hardly seems possible that they could since have become extinct. Nevertheless, how have they disappeared or where they have gone seems a mystery. There are living hundreds of persons who remember when vast flights of wild pigeons could be seen almost any day in November.

All about Poughkeepsie, for instance, in old times, pigeons were killed by thousands, and many men now living there have made up parties to hunt the birds.

A pigeon roost, was a place where confusion worse confounded reigned supreme. Toward evening, when the foraging army returned to its nightly resting place, the uproar and tumult caused by the rustling of tens of thousands of wings was deafening and bewildering. The place was not without its dangers, for branches of trees were torn from their trunks by the weight of the birds and crashed to the earth, breaking other branches in their fall and startling thousands of ready wings to fluttering, until the sound was as a roaring of a mighty wind through the tree tops. In such mishaps, which were constantly occurring over a wide expanse of country, numberless birds were killed or wounded and fell to the ground.

The birds would not forsake the roost, so long as food could be obtained within a half-day's journey. In the nesting season, when the male birds attended with the most assiduous care upon his mate, these dauntless husbands have been known to fly 200 miles in search of food, and their return was the signal for an outburst of the most clamorous joy on the part of those who remained.

Always about a pigeon roost were many birds, usually males, who evidently believed that they also serve who only "stand and wait." Those birds were to the pigeon roost as the drones are to the hives, and reaped some other pigeon's sowing. These birds were evidently despised by the workers, for when the demand for food became too aggressive they were set upon by a mob of pigeons and remorselessly lynched. The usefulness of these idlers has never been discovered, and as the family relations of pigeon life were known to exist, it is surmised that they were the duds of pigeon civilization.

In many localities around Poughkeepsie these wild pigeons in their annual flight southward, seem to have had certain woods, where they almost always stopped to rest, yet it is not known that the same birds ever returned. The steady column swiftly deployed into these woods, until every tree was weighted down with its living load. Within an hour or two after nightfall the birds became quiet, and the sighs of the winds were the only sounds, save the gentle coo of some sleepless birds, whose rest was disturbed by the encroachments of others. Late at night, when the tired birds were supposed to be deep in slumber, men came from all directions with wagons piled high with coops. They were armed with long poles and sticks, and carried torches. The light's glare seems to paralyze the birds, for those in the vicinity of the lights remained inactive, while the men beat those on the lower branches into insensibility with their poles. The dead and wounded birds were gathered up and stuffed into coops until they would hold no more. In the daytime, both in the vicinity of the roosts and over the country generally, the birds were caught in nets, and countless thousands were destroyed in this manner. The nets were stretched over oblong frames of wood about 6ft. wide and 20 to 30ft. long. A favorite place for setting the nets was in an open wood, where the nets were placed at an angle of 45 degrees and held in position by light props at each end. A string tied to each prop extended to a screen of cornstalks or brush, under which a man lays concealed. Grain was scattered plentifully under the net and a few stool pigeons were tied there. If a flight of pigeons came near, the foolish stool pigeons fluttered to the length of their restraining cords and attracted the attention of the passing birds. The pigeons—usually hundreds in a single flight—drove on with incredible speed, but whirled and came flying back lower and lower each time, and when they saw the alluring grain, plumped down to the ground and walked under the net, when the props were jerked out, the net fell upon the birds, whose struggles availed them not. Then they were either carried to market or taken home and usually placed in the corner, where they dashed themselves in a frenzy of fear against the sides of the building. The worst injured were immediately slaughtered and the rest were left until they were wanted, when the farmer entered the crib and beat down with sticks what he wanted for his dinner. The nature of these birds was wild, and no matter how long they were kept in confinement, not one of them ever lost its tameless spirit, or ceased to struggle with desperate energy to escape when the crib was entered by anyone.

Sometimes, especially in wet weather, the birds flew so low that they could be killed with sticks and stones, and any man or boy who could load a gun and fire it was sure to bring down one or more at each discharge. Sometimes a small cannon was loaded to the muzzle with slugs and missiles, and when a flight appeared in range it was discharged, and the ground was blue with the little soldiers who dragged their maimed bodies

into high grass or any place of concealment and fluttered up to the very wheels of the instrument that had caused their death. James Fenimore Cooper, in his book, "The Pioneers," gives a most interesting and graphic account of a slaughter of wild pigeons in which a small cannon was used.

That these birds should have disappeared from this section of the country is hard enough to realize, but that it should become so nearly extinct in the United States passes comprehension, since it was common to a vast section of the country. Audubon, the great ornithologist, observed a flight of pigeons in Kentucky that extended as far as the eye could see, and was more than five hours passing. He attempted to compute the number of individual birds in the flight, and estimated that there were more than 500,000,000. Further than that he estimated that there could not have been less than that number in the smaller and detached flocks, which were passing to the North in great numbers early in the day, flying very swiftly and unusually high.

These first flights appeared to be the vanguard of the immense army, patrolling the blue field of heaven, unheralded, yet possessing the dignity and confidence of overwhelming numbers. He observed with wonder that the number of flocks visible early in the day increased and multiplied until the earth was canopied with the feathered hosts, and that when the main body of the rank and file had passed there were yet detached regiments to cover the rear of the fleeing army. The stragglers continued to pass until darkness rendered them invisible.

This wonderful flight is well authenticated, not alone by Audubon, which would have been sufficient, but by many persons who were living in the territory over which the birds flew.

The disappearing of the pigeon reminds us that only a few years ago flocks of what is known as tame doves could be seen around this place daily. The court house roof was a great roosting place for these birds, which also have nearly disappeared, but few being seen in that vicinity.

A. V. MEERSCH,

[Mr. Meersch further advises us that at the time of this last flight of pigeons in Dutchess Co., which he says took place in 1895, great numbers of the birds were killed and sold for food all over the country. Many of those who were engaged in the destruction came from the towns of Kingston and Amenia. Cannot some of the readers of FOREST AND STREAM give us further information as to this matter? It is certainly worth recording.]

LAKEWOOD, O., April 15.—*Editor Forest and Stream:* This morning, about 8 o'clock, I saw a flock of fifty or seventy-five birds flying in a northeasterly direction, and if it had been twenty years ago I should have called them passenger pigeons beyond a doubt; but now that these birds have been pronounced extinct by high authorities, I hardly dare venture an opinion or believe my own eyes.

Nevertheless, this flock was moving along in true pigeon style, and I would advise sportsmen to look sharp about the Alleghany and Adirondack mountains, as they were headed that way, and are probably there at this writing.

A. HALL.

Instinct.

Editor Forest and Stream:

To prove that the lower animals reason I shall make use of the facts that scientific investigation has disclosed.

Science teaches that in the brain of the vertebrates, man included, the seat of mind is situated in the "supreme hemispherical ganglia." The invertebrates do not possess these higher nerve centers. They have no centers of intelligence and will, like the higher animals. All the intelligence they exhibit is located in the sensory ganglia. A study of insects, however, will prove to any one that they possess an intelligence akin to reason. The bee and the ant are noted examples that prove something more than blind instinct. The fact is science cannot draw the line where mind commences in animal life. In the evolution of mind there are grades from the lower to the higher life. Man's mind is superior because it is ministered to by superior organs.

What is a superior organ? I will illustrate. In the nose of man there are the inferior turbinated bones. They are scroll-shaped, which increases the surface exposed. These bones are covered by the mucous membrane through which the olfactory nerves are distributed. Because the surface is large, man possesses the sense of smell in a high degree. These bones in the dog are separated into plates or leaves, which greatly increases the surface to which the nerves of smell are distributed. Thus the dog's sense of smell is superior to man's because he possesses superior organs. The brain follows the same natural law. In the lower animals the primary convolutions may be traced. The Hottentot brain is far below the brain of the European. In the latter the arrangement of the convolutions is remarkably complex. A large surface is thus exposed to the network of nerves that minister to reflection, giving to man the power to reason beyond any other animal, just as the dog's sense of smell is increased by the increased network of nerves that minister to the sense of smell.

Is it not a logical conclusion that the lower animals can reason when we are told by science that they possess the necessary organs? It is one of nature's laws that a useless organ soon disappears. Why do these persist? The answer is plain: Because they are used and are absolutely necessary to the existence of the lower animals. Without the power to reason animal life would be blotted from the face of the earth, as nature is constituted to-day. Man's reason is occupied with the surroundings of his daily life. The same is true of the lower animals.

Man considers first the three necessities of life—food, shelter and clothing. After that comes the luxuries. The lower animals consider food and shelter and how to maintain an existence. The advent of man was a serious danger to most animal life. The animals under changed conditions were forced into new channels of thought. Some, like the rat, reasoned it out by forcing man to provide food and shelter. Some were domesticated. Others were exterminated. Those that exist in a wild state to-day find their surroundings continually changing, and the bitter struggle for existence turns

their thoughts into new channels. Reason must work out their fate. If they adapt themselves to changed conditions and maintain an existence, it is evidence of a power to reason, which can only be denied by assertion.

Mr. Wade's argument contains all the earmarks of the argument advanced by opponents of reason in the lower animals. I will put it in a nutshell.

"The acts of animals which seem to indicate reason are null and void because of other acts which seem to indicate a lack of reason."

This boils it down and reduces their argument to a plain statement. They measure animal intelligence by some act which seems to indicate a lack of reason, because man can compass the act, while they coolly ignore millions of acts that indicate reason in the lower animals as well as in man. Again, if these "blind leaders of the blind" will apply their logic to man they will find themselves obliged to deny reason to mankind.

Take the dog trained to protect the child's perambulator, which Mr. Wade asserts attacked another child because there was a limit to a dog's intelligence, as much as to say that man would not fall into such an error.

What can Mr. Wade say about the unnumbered errors which are so common and are usually caused by trained human beings who fail to comprehend orders? Would he limit the intelligence of mankind because of these individual errors of judgment?

Mr. Wade cites that old fable of pushing the burning brands together to show that animals do not comprehend such a simple problem. Mr. Wade forgets that fire is not necessary to the existence of the lower animals.

I challenge him to name anything that is absolutely necessary to maintain the existence of the lower animals which they do not comprehend. When whale oil and the tallow candle made darkness visible man did not comprehend the electric light. He had the electric spark, why didn't he push the brands together and enjoy a new light? Simply because it was not necessary at that time. Man's necessity evolved the electric light. He pushed the brands together when he was educated to it. A logical mind will judge the lower animals by the same rule, and grant them the power to reason upon the things that are necessary to their existence.

Mr. Wade's remarks about adoption are wholly illogical. Adoption is a common thing in human life. Strange children are adopted and tenderly cared for, and sometimes it seems impossible to reconcile the act with a power to reason. Surely if human beings adopt strange offspring animals cannot be deprived of reason for doing practically the same thing.

The cow that was satisfied with the hide of her calf always bobs up serenely in the controversy. I wonder if it ever occurred to those who advance this argument that the cow comprehended the meaning of death, and accepted the situation just as poor human beings are forced to do? My experience when a farmer proved to me that animals comprehend death. It frequently happened in cold weather that lambs dropped in the night would get chilled. Such were removed to the house, but usually died. The mother would be placed in a pen by herself and one of a pair of twins would be placed with her for adoption. At first I had no end of trouble with these sheep. It was almost impossible to get a sheep to adopt a lamb. A farmer, old at the business, told me to let the mother have the dead lamb for a short time. As he expressed it, "The mother is saving her milk for her lamb, which she thinks is alive and hungry. When satisfied that it is dead she will adopt another."

I found the theory all right in practice, and had but little trouble afterward.

I applied the theory to my cows, with the same result. During my fourteen years of hermit life I have run across many incidents that prove that wild animals comprehend the meaning of death. Two years ago I found the nest of a "wild" domestic cat in an old stone wall. There were three live kittens and one dead one. I left the dead kitten as an experiment. Whenever I had found a nest before this, a visit a few hours later would find the nest deserted, the kittens removed to some secret spot. When I again visited the nest in question it was deserted save for the dead kitten. If that cat had no conception of death she would have placed the dead kitten beyond my reach, and for the same reason that caused her to remove the live kittens.

Mr. Wade and his ilk do not call on science to verify their claims. We know how gladly they would do so if science was on their side. They claim that the lower animals cannot reason because they do not reason in all things, but forget to apply their logic to mankind.

What can be said of the millions of human beings who use alcoholic drink to excess, knowing that the penalty is death or dementia?

If any large number of animals should act in such an unreasonable manner Mr. Wade and his friends would blazon it to the world, as sure proof that animals lacked reason. In my study of animal life I find that the lower animals stick closer to the lines of reason in adapting themselves to their surroundings than does mankind.

I will put the reason of the sturdy red squirrel that lays up food for a cold winter against the reason of the spendthrift who, having spent a fortune, goes to the hospital to die with a loathsome disease. Who would not score one for the squirrel?

HERMIT.

Edible (?) Puff Ball.

I REMEMBER that some time ago the FOREST AND STREAM showed its readers some fine illustrations of the mushroom, and this led me to make inquiry, together with what I saw. I am extremely fond of the genuine mushroom, and had thought it was the only edible variety of the fungi. But one afternoon I went out of town to shoot woodcock. On my way I came across several gentlemen and ladies, who are artists in the copying house of this city, and found them gathering the fungus that in decay is called the "puff-ball," which all country residents are familiar with. It sometimes grows as big as a man's fist, is round, almost white-skinned, and pure white inside while fresh, and when thoroughly decayed and dry becomes purple in color, and sends forth volumes of purple smoke when burst.

Well, this party had about a peck or more of these

fungi. "What?" said I, "you are not going to eat these?" "Certainly we are," said one of the men, who began talking of the different species, and I concluded he ought to know what he was about, as he seemed to be up to date in the matter of botany as it regards the mushroom and its congeners.

And they ate them. Talking with several who partook of the fungus, they said it was entirely safe when fresh and white, but should not be eaten when it began to turn its color. They are sliced, then soaked an hour or two in saltish water and fried in butter.

Can the FOREST AND STREAM or some of its readers give us any points of enlightenment on the edibility of the "puff-ball"?

N. D. E.

Game Bag and Gun.

American Game Parks.

The "Forest and Stream's" Fifth Annual Report on Game in Preserves.

(Concluded from page 287.)

Charles F. Dietrich's Game Park.

MR. CHARLES F. DIETRICH's park at Milbrook, Dutchess county, N. Y., has an area of 3,000 acres. Of this about 2,400 acres are fenced with a gal. woven wire fence of Page manufacture.

Mr. Dietrich has at present one hundred white-tail deer, as well as smaller game. When his game enclosure was much smaller than at present he tried the experiment of stocking with German roe deer. They did not thrive, however, in the thirty-acre enclosure. They could stand it for a year or two, but in the end all died. The roe is essentially a forest deer and cannot bear confinement in small, open parks. Some friends of Mr. Dietrich who tried to rear them in Germany under similar conditions said the deer always died, and that their bodies were generally found close to the restraining fences.

Mr. Dietrich has imported German hares on three or four occasions, and at present he has several hundred of these animals, which have been acclimated and are doing well.

He has put out 500 quail for the coming season, and released the same number last year. English pheasants are raised each year at the park, and a certain number are released previous to the shooting season.

Two years ago this journal mentioned Mr. Dietrich's experimental stocking with prairie chickens. Unfortunately the plan was not a success, as all the birds have died or disappeared. The ruffed grouse put out about the same time are doing very well, and have increased in number.

The attempt to introduce English partridges was not successful, as the birds are tender and do not seem able to stand our climate. Mr. Dietrich will, however, try another importation in the near future. The German partridge, "feldhuhn," which closely resembles its English cousin, and which is certainly more robust, seems to be thriving. Mr. Dietrich found a covey of these birds which had bred in the park late last fall.

There are some small natural lakes in a hilly portion of the park, which contain fish. Several streams crossing the meadows and also some artificial ponds have been stocked with trout.

Mr. Dietrich has imported from time to time a considerable variety of European song birds. The nightingales which he released died. Finches of various kinds did well. Finches are almost as hardy as English sparrows and are well able to take care of themselves. He has made several experiments with skylarks. Last spring fifty or sixty were released. They were seen all during the summer, but when fall came they migrated south. Birds put out previous seasons have not returned. Mr. Dietrich is particularly anxious to introduce this enchanting songster and will try another importation. His birds are procured from Germany, but are identical with the English skylark.

Ozonia Park.

Ozonia Park has been somewhat enlarged and now contains 2,000 acres of densely wooded mountain land, including Lake Ozonia. It is situated seven miles from St. Regis Falls Station, on the New York & Ottawa Railroad. Adjoining it are 6,000 acres of forest which I control, but do not include in the park, being partly lumbered.

The park is kept for friends and for the guests of my summer hotel, Fernwood Hall. The lake has been stocked with salmon and brown trout, and landlocked salmon, but the principal fish are black bass. Deer have been unusually plentiful during the past year.

Every year makes me more determined to preserve the virgin forest and the beauty of nature, as I see more proofs of its great value to the worn and weary from the cities.

FREDERIC M. HEATH.

Brandreth Park.

"We have no new information regarding our preserve. We have protected it carefully for the last twenty-five years and now estimate the number of our deer at 1,000. These figures are considered by many to be far short of the actual number, however.

"We have not imported any exotic species, and so far as our experience goes those who have done so have little but trouble and expense with them.

"The preserve includes some 30,000 acres and thirteen lakes and ponds, the largest being four miles long. Grouse are becoming fewer each year, owing, we think, to the increase in the number of foxes."

Cutting Preserve.

Mr. Frank A. Cutting writes:

"My preserve is well protected and the deer are increasing; also the deer are increasing in the territory surrounding me. Owing to their being protected on my preserve and increasing in numbers there, they then stray away to the adjoining territory.

"The law prohibiting hounding is a great help to the deer and will cause them to increase faster in all parts of the Adirondacks.

"The deer that are now killed in the fall are nearly all bucks.

"Quite a number of bear are on my preserve, but none have been killed lately."

New England Game Conditions.

In reply to your letter, would say that I have no preserve. We live in summer at Mount Washington, Berkshire county, Mass. The innkeepers on the Harlem road carry their boarders up our hills and promise them game. The woods and streams have been fairly drained of game. I suppose it is useless to hope that any place so near New York should be able to preserve any game, but I wish the law had been enforced to keep something to propagate. We are now without grouse or trout, whereas, years ago the hills and streams were full of both.

JAMES MACNAUGHTAN,

Colorado Game.

MR. D. C. BEAMAN, of Denver, Colo., who has been gathering evidence regarding the effect of the winter upon the game, sends us the following reports from correspondents, and his own conclusions as to the game situation:

Warden Wilcox, of Steamboat Springs, says that so far as he knows there has been no actual loss of elk in the Steamboat Springs country; that several bands are in that region in 3 to 5 ft. of snow, and getting thin, but in no immediate danger if not disturbed and compelled to go up into the deeper snow. Deer do not winter there.

W. L. Pattison, who resides in Pot Hole Valley, Rio Blanco county, ten miles above the forks of the White River, says that near his place the elk are not just now so plenty as in former years at this time; that about 200 are on the low ridges in sight of his house, and about seventy-five are wintering in the valley with his horses; that there is little snow on the south slopes, although it is 5 ft. deep in the valley of the White River, that there has been little cold weather. Most of his horses are still getting along without hay. That last fall there were more elk in that region than for many years past; bulls in bands of twenty or thirty, and cows and calves in bands of 100 or more; that the forest fires probably had something to do with their presence then so low down. They are mostly wintering this year on Morapos Creek and other tributaries of the Yampa north of Pot Hole. Their condition cannot now be ascertained, but he does not anticipate any considerable loss, as the conditions there are not likely to be different from those on the White River.

Ed. Kennan, on Wallace Creek, in Mesa county, twelve miles from Debeque and in the winter deer range, says that the later storms drove the deer down into the valleys, but they are looking well. Some of them are feeding at his haystacks.

Summarizing these reports with such information obtained from others and personal observation in a portion of the region referred to, it is reasonable to conclude that the loss of large game from the storms alone will not be great, as the storms interfered with the market and head-hunter about as much as with the game, but that the depth of snow and the night crusting which is now occurring will give the lions, wolves and other beasts which prey on the game such an advantage that the loss will be larger than that of any recent year, and if the market and hide-hunters, who, like the other wild beasts, take advantage of the helpless condition of the game, regardless of the law, unless vigorously enforced, are not closely watched, the aggregate loss will be greatly increased.

This condition calls urgently for more paid wardens during the periods when meat, hides and horns are desirable.

Taking the whole game situation in, there seemed to be no reason why the deer season should not be lengthened a little at each end, and a short open season made on elk and mountain sheep. This would accommodate residents at both ends of the line—summer and winter range—and also the money-spending, law-abiding hunter and tourist, and in connection with a strict limit on the number which one person may kill in a season no harm can result.

When the game question was before the Senate, objections were made to the open season on elk and sheep, and as to sheep the objections prevailed. These open seasons have been pretty generally demanded by the people all over the State. The characteristics of the deer, elk and mountain sheep are not like those of the ox, but of the domestic sheep. One male is equal to the service of fifty or more females, and males are now more numerous than necessary for procreative purposes, and a short season on male elk and sheep would not lessen the increase. In fact, the killing off of the old ones (which, on account of their larger horns, will be the ones most sought for) will be of advantage by allowing the younger and more vigorous ones a chance to assist in propagation.

Another reason given for an open season on these animals is that so long as there is no open season whatever, the law-abiding hunter has no special interest in their protection as they are forbidden fruit to him, while the lawless hunter is not restrained by the law. But if there was a short open season the former would have an interest in protection that he might have some chance in that season, and he would thereby have an interest in seeing that the head and hide hunter kept the law.

It was asserted in the Senate discussion that antelope had been annihilated. This is a mistake. Ten or more years ago when the market-hunter was in full play, a great many were killed, but during the last ten years they have increased, and there are now thousands of them east of here, as well as in Routt county. There is little doubt as to considerable natural increase of elk and sheep the last two years. It has not been large, but it has kept pace with the unlawful killing.

A member of the fraternity of Elks in the Senate made a plea on sentimental grounds for the entire prohibition of elk killing. I am not a member of the Elks, but I have never heard of a member of that fraternity refusing to

shoot at a wild one because of his association with the name.

The lengthening of an open season is not objectionable with a proper limit as to number, in fact, it is better for the game than a short season, and no limit on number. The former game law had no limit on big game killing and its constitutionality having been questioned, hampered its enforcement and weakened it as a protective measure, and some new legislation was absolutely necessary. With this there should be good hunting in Colorado the coming season without detriment to the game supply.

Senate bill 148, by Senator Smith, of Leadville, was the only bill pending in the Legislature which met these conditions, and its passage was absolutely necessary to save the big game from serious diminution before next season. As originally drawn, it required licenses for hunting, for guides and taxidermists, which would have produced sufficient revenue to more than meet the expenses of its administration, and as these three classes embrace about all who reap any benefit from the game, there seems no good reason why they should not contribute the fund required. But the Senate thought otherwise, and struck these provisions out.

When the 90 per cent. of the people who do not hunt realize that they are paying the expense of protecting the game for the benefit of the 10 per cent. who do, they will probably favor these license features, as other States are doing. When these license features were eliminated the bill passed both Houses without other material changes, almost unanimously, and if not vetoed, will go into effect May 3, unless the Governor signs it sooner, in which case it will go into effect as soon as signed. There are still some revenue producing features left in it.

Captain Myrick, on the Grand River, four miles above Debeque, says the snow has been light in the valleys and only about 1 ft. on the lower mesas.

Captain Myrick is one of the forest rangers, and has been within two months over a great deal of the winter range of the deer on the Grand River and its tributaries, and is of the opinion that the deer are as numerous and in as good order as at any time within four years past.

M. E. Laswell, of Plateau Creek, Mesa county, agrees with Mr. Kennan and Captain Myrick.

James H. Templeton, who resides in Routt county, on the Yampa River, above the mouth of the Little Snake and Lily Park, near where the conflict between the game wardens and the Indians occurred in 1897, says that the loss of deer and antelope will not be much more than usual, the wind having kept the south slopes of the hills mostly bare of snow; that some will be destroyed by coyotes on account of the crusted snow on which the coyotes can run, but the game cannot. The elk do not winter in that region.

Incidentally, he says that the Indians were in that section again last fall and killed great numbers of deer, generally taking hides only and not the meat. That they kept away from the settlements mostly and were in parties of eight or ten, probably for self-protection.

A. S. Bennet, the game photographer at Craig, Routt county, says that the deer, elk and antelope, although having to contend with 3 ft. or more of snow, are, from all accounts, and to all appearances, in good condition.

A. G. Wallihan, the game photographer, formerly of Lay, Colorado, but now residing at Wells, Wyoming, writes that thousands of elk are wintering well near Jackson's Hole, Wyoming, where the snow has been very light. He has lived in Colorado and in or near the winter range of elk for many years, and is of the opinion that neither cold nor snow is harmful to the elk, unless taken advantage of by the market and head-hunter, as is likely to be the case.

This emphasizes the utility of the hunting license with a coupon to be attached to every specimen. If this system were generally adopted, every head without a coupon would be contraband and subject to seizure, and the market-hunter's occupation would be gone. Wherever it is in use it has the emphatic indorsement of the game commissioners as the most effective means of protection ever devised.

Mountain grouse are snow birds from choice, and in winter always seek the higher regions and the heavy spruce timber where the snow is deep, and depend entirely on the foliage for food, and there is no reason to suppose any loss among them. Judge McDougal, of Gunnison, says the sage chicken have not suffered at all.

Within the last five or six years the Bob White quail which were planted along the front of the range between Denver and Fort Collins have increased rapidly. Reports pretty well authenticated indicate considerable loss among them this winter, but the actual extent cannot be ascertained until the snow goes off, as some of those killed may be covered by the later snows. It was mainly on this account that no open season was made on quail in the new game law.

In the Grand Junction region, up the Gunnison River as far as White Water and up the Grand to Debeque, the California or Arizona quail have become very numerous, and the recent storms did not touch that country sufficiently to do them harm.

Five years ago a fund was raised by the farmers and others near Grand Junction, and these quail were imported, and now they have become so numerous that they destroy the gardens and materially injure the grain in many places. It was generally agreed that they should not be killed for five years, which time expires this fall, and now the farmers want the privilege of killing some of them, both on account of their enormous increase and destructive nature, and that they may reap some benefit from their expenditure. It was at their suggestion that an open season on them was put in the new law, and yet a well-meant but probably mistaken assertion in the Senate struck it out in opposition to the wishes of the people most concerned, as I understood them.

Hunters are continually on the track of alligators and turtle, and it seems to us that if the Legislature do not put some restriction upon them, Florida is doomed to lose two of her very interesting and attractive features. The eggs of the loggerhead turtle on our seashore are nearly all taken out of their nests in the summer, while the alligator, in our ponds and lagoons, is meeting with rapid extinction. Call a halt, ere too late.—Indian River Advocate, Titusville, Fla., April 14.

Capt. Lafe's Swivel-Breech Rifle.

IN 1870-71, when Fayette S. Giles and the writer were mapping out territory for the Blooming Grove Park, in Pike county, Pa., we domiciled with Moses C. Westbrook while the club house was being built, and a very pleasant summer we spent. When fall came and hunting was in order, we put down the hounds on the tracks of the big deer which ran among the Knoles; and Genso C. Scott, David Dudley Field, Isaac McLellan, Jacob Pentz, the Westbrook brothers, Ira Chrisman, Ed. Quick and the rest of the local and invited hunters would take their allotted stands on the runways between the numerous lakes and creeks, and wait for the deer to pass. The other day I happened to see some mention made in FOREST AND STREAM of Uncle Ira's double hunting rifle, and wrote to Capt. Lafayette Westbrook, for particulars. In reply I was gratified to receive the following lines, which you may be pleased to print:

STROUDSBURG, Pa., March 24.—Chas. Hallock, Washington, D. C.—Dear Sir: I need hardly say that I was agreeably surprised to receive a letter from you, and to hear you are in the land of the living. My brother, Moses, whom you boarded with, is still living at Blooming Grove at the old place, in very comfortable circumstances. John C., the oldest brother, is still in Milford, holding the same office of prothonotary which he has held for thirty-three years. Not another man in the State has held that office anywhere near that length of time. He is now seventy-eight years old; Moses is seventy-two, and I am seventy-four. I was quite a politician while living in Pike; was in the Pennsylvania Legislature six years, and was the means of getting the charter for the Blooming Grove Association, and a liberal one it is.

Uncle Ira Chrisman has been dead quite a number of years. He died at Milford. In regard to the old double-barrel rifle that Ira hunted with when you were at Blooming Grove, that was my gun, given to me by my father, Solomon Westbrook. It was made by Nicolas Hawk, of Chestnut Hill, Monroe county, Pa., some time about 1830; was then flint lock. After having it some time he got it percussioned; he gave it to me about 1840. I killed over 100 deer with it and two bears. It was beautifully finished, mounted with pure silver, curled maple stock, barrels on top of each other, and worked by a spring by pulling on the guard. It was the first double-barrel swivel breech rifle in that section of the country. Last fall I gave it to one of Moses' boys, to keep in the family.

Uncle Ira Chrisman thought a good deal of "old swivel," as he called it. He killed quite a good many deer with it. The original cost, I think, was \$75. That was a big price in those early days. The postmaster at Blooming Grove is John Kleinhaus. The one who was postmaster when you were there was Henry Kleinhaus. He is dead; they were half-brothers; Jacob Kleinhaus, the father, had his second wife. He was a tanner. I would like to meet you at Blooming Grove. I go up every summer with my wife. I was married October, 1876, and am connected with the East Stroudsburg Bank, as director and vice-president.

L. WESTBROOK.
About the time referred to, in 1871, I was the possessor of a Perry self-capping rifle, which I had owned and carried since 1856. It is described by text and cut in one of Frank Forester's books. It was even more ingenious than the swivel breach, for, although it was not a "two-shoot gun," it was vastly more convenient in cold weather, when fingers would become so stiff as to be unable to set a cap on the nipple. By a leverage on the trigger-guard, a heel section of the barrel some 3 in. in length was thrown up so as to receive a ball cartridge, and by the same action the nipple received a percussion cap from a brass tube which ran through the stock lengthwise. When swung back into line with the barrel, the charge was ready to shoot, and the rifle could be loaded and fired several times in a minute. The tube held thirty-seven caps. I sold this rifle in 1872 to Bob Crawford, the Hudson Bay Company's agent at Red Rock, Lake Superior.

CHARLES HALLOCK.

Circumventing the Gobblers.

WRITING from Hamilton, N. C., Mr. S. W. Everitt tells of unsuccessful days in turkey hunting, with better luck in the end: I started out across the same old field for home where we had flushed them before. I had not gone far before Loie struck a trail of them again. Away she went, and was gone for several minutes. I stood listening for her bark, but no sound came back. Soon I saw her coming; she had given it up or ran over it. I turned to the right and put her out again, but she could find no scent of them that way. I had not gone over 200 yds. when I looked to my right, and there about 100 yds away in the tall grass, was a gobbler picking along contentedly. I dropped on my knees and my dog was coming toward me. She saw me go down and knew something was wrong, so she came to me at once. I slipped a cord around her neck, and half crouching I ran 200 or 300 yds., making a half circle, so as to get ahead of him. I got in an old fallen tree-top and fixed myself and waited his coming. I thought he was making for the cornfield on the opposite side of the swamp, where I had flushed them on Saturday. This was about 1:30 in the afternoon. I waited patiently for about fifteen minutes. I got impatient and took out my call and began to call. I called a few times, but no response came. I waited about fifteen minutes more, calling occasionally. After a while I raised up and scanned the old field, but no sign of a turkey was in sight. I concluded he had seen or heard me when I ran down there and had gone. I got up and got my traps together and started for home. I thought I would go back the way I had seen the one feeding and see if I could see it or find out from the dog which way it went. I had not gone over 100 yds. before I spied one feeding along leisurely, not over 50 yds from where I left him and about 100 yds. away. I dropped on my knees again and decided that this time I would stalk it. I touched my dog and made her creep low, and I crawled along, putting my gun ahead of me. I crawled about 50 yds., and raising up slowly saw it feeding about 60 yds. away. I selected a tree about half way from it and crawled to this. About the time I got to the tree I noticed the little bitch get nervous, and begin to peep

to the left. I listened, and could hear a turkey walking through the weeds and grass. I gradually rose up on my knees, and there, not over 75 ft. away, stood a gobbler with its keen eyes glistening, trying to make me out. The right hand clutched the gun as it lay across my knees, and in a twinkling of an eye the hammer was cocked and gun went to shoulder. By the time it got there he had made me out and had sprang to run, but the second step he made old Betsy spoke out and he dropped dead. At the report of the gun the rest of his companions took fright and started to fly away. One came too close—about 30 yds. away. I gave it the other barrel and it dropped to the earth. I slipped the cord on Loie and she had a picnic after it, for it was not quite dead. She chased it around in the grass for a few seconds and came on it where it had fallen. I threw them across my shoulder and started to my wagon. Thus ended an exciting and careful piece of strategy, and I had the satisfaction of a nice double. At 4 o'clock I was at home, where a loving and smiling wife met me with a cheerful kiss. It was a day long to be remembered.

S. W. EVERITT.

Hunting Knives.

SOUTH HANOVER, Mass., March 2.—*Editor Forest and Stream:* I am interested in the recent notes in *FOREST AND STREAM* regarding hunting knives, for experience taught me years ago the value of a good knife and the difficulty of getting one which could be depended on to cut.

My hunting trips have extended in point of time from '69 to within a few years off and on, and in place from New Brunswick to California. They began with a two-seasons' trip, when a youngster in company with trappers in Nebraska and Dakota, and ended with a trip among the "billies" on Santa Catalina.

While I have seen a few times when a cleaver a quarter as heavy as my rifle, or a machete as long as my arm would have been handy, I have seen a great many times when a keen blade 5 or 6 in. long was exactly what I needed. My only encounter which had to be settled with a knife was with a half-wild hog, and it is not often one has to do this.

But when your game is down and has to be bled, skinned and dressed, and when innumerable things have to be done, for which you want a knife which will cut keenly and stay sharp with decent usage, then the difference between a cheap dollar knife and one skillfully made becomes apparent.

Tradition tells us that the sword of Richard Coeur de Lion, in its master's hand, cut through the iron handle of

PHILBROOK.

a mace at one blow. And the sword of Saladin divided into two parts at one blow a silken handkerchief tossed into the air.

I have only had twenty years' experience in tempering steel, so I may be pardoned for being a little incredulous about the knife which cuts open a frozen can of beans, and then is in shape to dress carefully the deer which has given up its life to afford me one of the keenest pleasures savage man enjoys.

It is a fact that few hunters know the luxury of a good knife. What I have evolved for a knife from my experience as a hunter and steel worker is singularly like what Mr. Hough suggests as the ideal in size and shape, if I catch his meaning.

N. W. PHILBROOK.

PHILADELPHIA.—*Editor Forest and Stream:* I inclose a photograph of what I consider the best hunting knife made, and as there has been a good deal of discussion on this subject I thought it would be of interest to other *FOREST AND STREAM* readers. The length of the whole knife is 8½ in. with a blade of 4¾ in. long.

At the back the blade is nearly 3-16 in. in thickness and is 13-16 in. in width.

The knife has an ebony handle, carved and checked, which gives a splendid hold. It is a beautiful piece of workmanship and as strong as any knife made. You can open cans or anything with it.

You can get them a little larger than the above, but you don't want it, as this size will answer every purpose.

These knives are used by nearly all the guides in Northern Maine and that is where I first saw them.

R. D. B., JR.

A few opinions of my own in regard to a hunting knife were published in a recent *FOREST AND STREAM*. Since then one of my friends, a poet, and myself have met in executive session and devised a knife model. My friend the poet is Ernest McGaffey, author of the tasty book "Poems of Rod and Gun," published by Scribners' some years ago; author of another volume of poems, and of a great many good things in prose and poetry which have been published in the best of our periodicals. Mr. McGaffey is a lawyer, and likewise a newspaper writer. These things he does for pleasure, but he considers the real business of life, just as I do, the following of the sports of the rod and gun. We usually call Mr. McGaffey Ernie out here in Chicago, which shows how used to association with genius we are, and also what a good fellow Ernie is.

Well, anyhow, Ernie McGaffey and I foregathered at my lodge the other evening and we devised a knife. We laid upon the table in front of us all my hunting knives, a dozen or so from the Hudson Bay knife down. We threw out all the bad points of these, and tried to keep all the good points, and the result was something which in our mind was a very beautiful and perfect creation. With proper sense of our worth, we named the model after ourselves, but in deference to the fact that there have been other hunters besides ourselves and before ourselves, we called the knife after one of the early and distinguished American hunters. I don't mind telling something of the points which seemed desirable to us in a hunting knife.

In the first place we thought the blade should be extended clear back through the handle, so that if a piece of steel, so that if a he could take off the handle and still cut with it a

We thought that the blade should be short. In our model the blade is 4½ in. long. It has no table or offset in front of the handle, but runs clean back to the handle with full contact. It has no ridge along the backbone, but is beveled straight to the edge. It has no foolish joint, but is cunningly turned up with a good skinning curve. The blade is deep enough to be strong, and runs up to an inch in depth at about the place where the curve begins on the point. The top of the blade swings up in a gentle curve to the top of the handle, which again swells in the middle, and then drops gently down at the butt, being curved on the under surface also. This gives a solid, substantial and not ungraceful handle, which offers a very good hold to the hand. The handle is about 5 in. long if I remember correctly, and it is made of two plates of bone, corrugated and slightly swelled in the middle, so that the knife will wedge in the sheath. To make the knife handsome and strong, the sides of the handle are strengthened by plates of brass, as in the Hudson Bay knife. We also kept the Hudson Bay idea of the two big brass-headed rivets through the handle, which finish and strengthen the knife. Of course there is no guard to the knife. We improved the handle of the Hudson

RODGERS.

KEPHART.

Bay knife by boring a hole through the end of the handle, through which a thong can be passed, fastening it to the scabbard if so desired, or giving the advantage which a wrist loop sometimes offers with a knife. Mr. McGaffey and I hardly know whether to pride ourselves most upon the blade or the handle of our knife, but we think both are good, though altogether the opposite of the conventional idea in hunting knives. We expect to get a strong, well-balanced knife, with a good handful of heavy handle. We expect that the hang of the knife will be such that one can do the most delicate of skinning with it, and that the steel will be such that it will both take and hold an edge, not too soft and not too hard. The usefulness of a hunting knife depends very much on the judicious temper in the steel.

The Kephart Knife.

Dr. W. L. Lake, of Fulton, N. Y., writes to-day on this very question of a hunting knife, and he mentions a knife which I presume has been designed by that investigative and thoughtful sportsman, Mr. Horace Kephart, of St. Louis. I have never seen one of Mr. Kephart's knives, but I will warrant it is a good one. I think I shall get one of these to add to my battery, and should the model which my friend the poet and I have designed ever come to manufacture, I shall see to it that Mr. Kephart gets one of the first editions.

This I want to do, so that Mr. Kephart will feel bad about his knife when he sees how much more brass and things there are on our knife. While I write somewhat in ignorance, I will venture the assertion that Mr. Kephart has bored no hole through the handle of his knife. This argument I will take up further, when the poetic carver above mentioned gets further along. Meantime I must append Dr. Lake's comment, which is as below: "A blade 5 in. long, no guard, and the sheath extends half-way up the handle. This the makers call the Kephart knife. It is my idea of a good 'meat' knife round camp (to borrow your adjective anent dogs). Just a plain business knife, made of steel, that will take an edge and keep it too. The point is strong and won't break off like a clip point, found on the ordinary bowie pattern."

E. HOUGH.

Editor Forest and Stream: I have been interested and diverted by the matter which

has recently appeared in *FOREST AND STREAM* concerning the best hunting knife. It reminds me a little of what you used to publish concerning the best rifle for general use. Men seemed to want one which should be equally deadly on grizzly bears and chipmunks—which should be capable of boring a moose through from end to end and yet should not send its ball so far but they could have target practice on the lawn.

The aged hunter who contemplates buying a knife naturally asks himself what the knife is to be used for. He does not purchase a machete for the purpose of sharpening his lead pencil, nor a penknife to cut his way through the jungles of Cuba. The men who talk about a hunting knife wish to secure—I assume—an implement to be used on the big game which they may kill. With this knife they wish to cut the animal's

THE HARDWARE STORE KNIFE.

throat, to disembowel it and to remove its hide. For such purposes the best knife is what we used to call a butcher knife, and this is a butcher's knife; that is the knife used by the man whose trade it is to cut the throats and remove the hides of animals day after day, year in and year out.

This knife, of which I send an outline, has a light blade, with a decided curve in it, which permits a long stroke during the whole of which it cuts. Straight knives admit of only a short stroke, which must be often repeated, and this adds greatly to the labor of skinning.

If a knife is purchased such as I have indicated an effort should be made to get a good blade in it. Very likely the salesman may be willing to try it on a stone for you so that you may be sure of what you are buying. When you have a good one take care of it.

These knives come in various sizes. My preference is for one with a blade about 4½ in. long and a handle 4 in. If I had a good one that I expected to use much I should wrap the handle, which is likely to be a little light, with a string of wet rawhide or with heavy twine. This gives a better hand-hold and prevents slipping, which you do not care to have happen if your knife has a keen edge.

P.

CHICAGO AND THE WEST.

Progress in Minnesota.

CHICAGO, Ill., April 22.—Just too late for use in last week's *FOREST AND STREAM*, I received a letter from Mr. S. F. Fullerton, late game warden of Minnesota, bearing upon points in the game law which has been enacted in that State this spring. It is gratifying to note that Mr. Fullerton's interest in protective matters does not terminate with the expiration of his term of office, and especially satisfactory to note that steady progress in protective matters still continues in this representative State.

No doubt the greatest step forward in the Minnesota law is the stopping of spring shooting, as legislation of that sort has always been unpopular in many of the western States, and indeed impossible of enactment in the majority of them. Michigan is shaky on spring shooting, and Wisconsin has always been wabbling, but they may both take courage from the re-enforcement offered by the strong body of Minnesota protectionists.

Of equal importance with this measure, perhaps of greater importance, were it capable of equally easy enforcement, is the stopping of the sale of prairie chickens, grouse and quail. This is indeed progress, and its result will be seen directly, although this measure will throw arduous duties upon the executive officers, since Minnesota is a vast country and possessed of many wily dealers.

Not so certain is the wisdom of the license fee matter, although this is a measure agreed upon at the interstate warden's meeting last year. The license idea is still in an experimental stage in the opinion of very many, although the deer license is a thing which has no doubt come to stay, and Minnesota simply follows the precedent of Wisconsin and Michigan in attempting to set a partial limit upon the ever-increasing tide of non-resident deer hunting traffic. If the idea of a non-resident license be distasteful to non-residents, and apparently unfair, it is to be said upon the other side that it has many arguments in its favor. The men of Minnesota have looked about them, as have the men of Wisconsin and Michigan, and discovered that there are more hunters than there are deer, and as the stock of deer does not increase, while the stock of hunters is constantly and largely augmented, the result has seemed obvious, that in a short time the supply of deer will be altogether gone. We have in the Middle West but these three States which hold pine forests where the white tail deer is found. Upon the other hand, we have more than a dozen States, containing thousands of hunters, all of whom turn toward these three States for the enjoyment of their sport. Viewed from the standpoint of the resident of any one of these States, it seems a fair enough proposition to ask a non-resident deer hunter to pay a reasonable price for the royal sport of hunting the deer. Without doubt or question there must be restriction of some sort. But I must allow Mr. Fullerton to make his own comment upon a law which is so good and so much to his own liking. He writes as follows:

"I think we have accomplished more for the protection of game in Minnesota during the session of the present Legislature than I had really hoped to see accomplished in the next five years. We have nailed down *FOREST AND STREAM*'s Plank with spikes, and nailed it down in such a manner that I believe it will so remain for all time to come.

"We have stopped, by law, the sale of prairie chickens, pintailed grouse and quail, and stopped their shipment

either within or without the limits of the State, and that with the ruffed grouse completes the list of the principal game birds we have here, and goes further, in my estimation, toward their protection than if the Legislature had appropriated another \$25,000 for the policing of the State with that many additional wardens. As you are already aware, the stopping the sale of game has always been a hobby of mine, and I wish to thank *FOREST AND STREAM*, and I know every game protector in Minnesota wishes to do likewise, for the splendid assistance rendered, and for the consistent course that has always been pursued in regard to the very foundation of game protection. In my estimation this will insure good chicken shooting, sharp-tailed grouse and quail shooting for Minnesota in the future. We have also allowed the law to stand in regard to black bass and brook trout, which will preserve these two species of fish in the same manner similar laws will preserve our game.

"We have also added another chapter to our game laws, which, in my estimation, is a twin brother to the above, and that is, we have stopped spring shooting, which will insure a good supply of native ducks for the sportsmen and the farmer's boy in Minnesota. We have fought those vicious measures for the past three sessions of our Legislature, and had a bitter fight again this year but we carried the day, and the whole matter is now before Governor Lind, who I am satisfied, will sign the bill.

"We have some Senators in Minnesota and some representatives whose names shall be inscribed on the hearts of every game protector in the State, and for the matter of that, on the hearts of every game protector in the United States. They have worked consistently and earnestly to bring this about. The chairman of our game and fish committee in the Senate, the Hon. J. H. Ryder, although not professing to be as old a sportsman as some of the others, has done splendid work, as has also the Hon. Joe Wood, chairman in the House, but the real leaders in this movement have been the Hon. A. F. Ferris in the House, and the Hon. J. D. Jones in the Senate. Of course they were backed up by a number of others who have taken an interest in this matter, but to Senator Jones belongs the credit when he was Speaker in the House two years ago, of leaving the chair and making a speech on the floor of the House in favor of stopping the sale of ruffed grouse. That was the entering wedge, and the good results from that amendment helped us in the fight this session.

"Of course we had the usual number of fights and a lot of crazy amendments introduced. We had an amendment offered to allow gill netting in all the inland waters of Minnesota; another allowing pound nets and the use of seines in Lake Pepin, but we fought them all down, and have now got a game law that I have no hesitation in saying is the best that can be produced in any State in the Union, and if the sportsmen and the men who take an interest in game and fish protection will stand nobly by the commission and the different game wardens appointed by them to look after the protection of our game and fish, we will all reap the benefit therefrom, in being able to go out and catch a good string of fish and secure a good bag of birds at any time in the open season for same.

"We also passed a license law, an account of which I presume you read in the papers before this. The non-resident now coming to Minnesota to hunt deer will be compelled to pay a license fee of \$25, and the resident a nominal fee of 25 cents. The original bill called for a license fee of all shooters, but such determined opposition developed in regard to the matter, we had to be content with a 'half-loaf' rather than have no bread at all. We also changed the date of shooting deer from Oct. 25 to Nov. 1, but left twenty days, the same as before. No deer can be sold the first five days of the season, which we consider is a step in the right direction."

Couldn't Skin the Cow.

I was speaking a moment ago of Mr. Kemeys, the sculptor, who lives at Bryn Mawr, and I am reminded by him of the story which appeared some time ago in *FOREST AND STREAM*, of two hungry Cheyenne Indians, who knocked down a buffalo and thought they had meat, only to see it get up again and run away. Mr. Kemeys is himself an old-timer, and killed buffalo on the range thirty years ago. He tells me that one time he shot down a fine cow, as he thought, quite dead. He pulled the carcass into shape for skinning, and started in to make the incision down the hind leg, beginning at the inner side of the hoof. As the point of the knife touched this sensitive nerve center, the cow all at once changed her mind about dying. With a snort and a bound she sprang to her feet, nearly knocking the breath out of the hunter, and then running like a deer, she disappeared rapidly from view and actually escaped, apparently as good as new!

A Lost Carrier Pigeon.

On the chance of its being useful to some one who has carrier pigeons, I may print the note from Mr. T. I. Phelps, of Greenville, Mich., who writes me: "I have in my possession here a carrier pigeon which flew in at my opera house window about two weeks ago. The bird has a number on its leg, 'Miles, 5596.' Owner may have same by paying charges."

Jack Snipe.

The jacksnipe are in over all this section of the country now, and shooting is merrily going on. The usual Kankakee points are yielding their quota, and the prairie sloughs west and northwest of this city are showing some returns. Water Valley, Ind., is overrun with shooters from Chicago. My poet-sportsman friend, Ernest McCafferty, has concluded that the pen is not mightier than the gun, and yesterday went to Shelby to meet the spring run of snipe. I have no doubt he will have good luck, for the weather has been just about right and conditions are as good as they can be for this erratic and undependable bird.

E. HOUGH.

480 CANTON BUILDING, Chicago, Ill.

The *FOREST AND STREAM* is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Currituck.

CURRITUCK, N. C., April 19.—The ducking season, which closed March 31, has been one of the best we have had for many years. The natives who shoot for the markets have sold far many thousands more than last season, or the season before, while the club members from the North have had excellent shooting also. Canvasbacks have been specially plentiful, and one of the members of the Narrows Island Club bagged eighty-eight in one day, besides many other ducks. This is the largest bag of canvasbacks I have known of being shot at Currituck in fifteen years.

Our shooting seems certainly improving under our present laws, and our last Representative, the Hon. S. M. Beasley, has made still another improvement, viz., no shooter is allowed to leave the landing place until sunrise. He has made the open season Nov. 10, cutting off ten days. This, I think, is a mistake, as the ducks will eat the greater portion of the best food during this ten days and go on further south. I would much rather see the time taken off the spring end of it. In fact, I think all spring shooting should be stopped altogether. I had a letter to-day from one of New York's best-known sportsmen, who spent ten days with me last spring shooting yellow-legs and other bay birds. He writes: "I shall shoot no more in the spring. My experience last spring proved it to be dead wrong. The birds were all mated, and many of them filled with eggs. I hope to see spring shooting abolished."

Yellow-legs and all kinds of plover are much less plentiful than usual at this time in April. No large bags have been made, thirty-five by my own gun being the largest. English snipe have also been exceedingly scarce; in fact, they have almost ceased to come this way on their northern flight. We have a much larger flight in September. I noticed the first flight of curlew to-day, but, strange to say, they were going south.

The fishermen who fish for large-mouth black bass have been catching an abundance of very large German carp, and no one knows where they come from.

The catch of sturgeon so far has been exceedingly light, and caviar is very high in consequence.

Shad have not been nearly so plenty as last season, but striped bass are unusually abundant.

MORE ANON.

Bloody Brook.

I READ in your paper of the 8th Mr. Brown's rather slighting reference to the massacre at South Deerfield, Mass., with a feeling of sorrow amounting almost to indignation, and I thought a few words on the subject would be worth at least the writing. There were no women nor children who fell that day, but the very choicest of the young men—over seventy in number—of the towns of Hadley and Hatfield. I am Hatfield born and bred, and I write the story as I heard it from the lips of the descendants of the same families, possibly of some of the men who were slain.

Hadley and Hatfield, then under the one name of Hadley, were settled first; then the settlers passed on up the river, some twelve miles to Deerfield, with the promise that if they were troubled by the Indians they should receive assistance from Hadley. One day in early fall word came to Hadley that the common enemy had appeared about Deerfield, and eighty of the young men, under strict orders not to break ranks until past all danger of attack, were sent to the aid of the settlers there. On reaching Deerfield they found no signs of the enemy, so started homeward. Arriving at what is now South Deerfield, then an unbroken forest, they found the vines of the wild grape so loaded with ripe clusters that they could not resist the temptation to stop and eat their fill, so most of them stacked their muskets and climbed into the trees with that intent, and while so occupied and wholly defenseless were attacked by the Indians, who had been following them, and over seventy of their number were killed. So freely ran their blood that day that the waters of the little brook on whose banks they were ran red with their blood. Hence its name of "Bloody Brook" to this day. A little monument with the names of the slain now marks the spot.

I think in all the annals of Indian massacre with which our land abounds there are none more pitiful than the tidings the few survivors of that day must have borne to the little hamlets down the river. I think it was the Iroquois tribes of Canada that the settlers were then fighting. Possibly I feel different about these things, for that I number among my ancestors on the maternal side one who fell in the fight in the Rhode Island swamp when King Philip's power was broken.

PINE TREE.

Tennessee Wild Turkeys.

BLED SOE COUNTY, Tenn.—I see nothing in *FOREST AND STREAM* from this section of the country in regard to game. While the country is not noted for good hunting yet there is quite a lot of game here, especially of wild turkeys. Part of Bledsoe county is on the Cumberland Mountains. I spent last fall and winter hunting here, and had good sport. I killed somewhere between seventy-five and eighty turkeys and seven deer, to say nothing of pheasants, which are quite plentiful. The oldest mountaineers tell me that fifty years ago there were vast herds of deer; and lots of black bear were to be found in the great gulches of the mountains. But Bledsoe county has never had a game law, and hunters from a distance have made this a resort so often that the game has been comparatively all destroyed.

This part of the mountains is quite interesting on account of its imposing scenery and many beautiful little streams, the most noted of which is Cain Creek. This is right in the heart of the mountain; and on the banks I made my camp and enjoyed one of the happiest hunts I had experienced in a long time. The first morning after I reached Cain Creek and built my camp I had the good fortune to bag as fine a buck as ever sportsman killed. The ground was still white with frost although the sun began to fall upon it. I saw far down a glade the antlers of a buck bobbing and glistening in the sunshine. He was coming straight down on me, so I waited until he came

within close range, then gave a low sudden bah. The old fellow paused for a moment, but in that moment I sent a soft-nose bullet whizzing through his neck, and his race on earth was done forever.

J. W. DRANE.

Eastern Massachusetts.

DANVERS, Mass., April 16.—Yesterday was the last day of the shooting season, closed on black duck. I think about the usual flight was in. I heard of a snipe being seen yesterday.

There has been an unusual big catch of muskrats up on Ipswich River, one man trapping and shooting thirty-five in one day. A few wood and black duck have been shot on these meadows. Most of the spring birds are here. Frogs came out of their holes on the 14th. I do not hear of a quail, but they will commence to whistle in about a month, and I will let you know how they tune up.

JOHN W. BABBITT.

Sea and River Fishing.

Trouting Near Home.

TEN miles northwest of the "City of Elms," as the crow flies, and in the county of New Haven, lies as grand a section of country for the propagation of American game birds as the sun ever shone upon. Green, rolling fields, foliaged hills, enchanting valleys; dark, heavily wooded ravines, and scared, precipitous, semi-mountain sides greet the eye. In places placid pools and lakes, most of them artificial, glisten in the sunlight, mirror the rugged hillsides and reflect the fleecy clouds dreamily drifting athwart the summer skies.

Agas ago, when nature first fashioned these hills, she left huge, basin-like depressions in places on their tops. Then vegetation started, and generations of snow and rain washed waste and loose vegetable matter into these depressions. For centuries this matter decayed and settled, until those huge, natural sponges called marshes were formed. These absorbed and held the moisture of the snows of winter and rains of summer. Then springs burst from the ground. Through fissures in the rocks, and winding their way over uneven surfaces, tiny, infant streams commenced to trickle. These gradually intermingled until small brooks were formed, which, as they increased in volume, tinkled on their way like tiny silvery bells. Gaining strength with each new reinforcement, their bell-like voices blended in a deeper babble; then, plunging from the hillsides, these larger streams intermingled until one grand trout brook was formed. To-day this brook flows through the woods and valleys, tumbles with rush and roar down gloomy ravines, where the sunlight scarcely penetrates, brawls over boulders in foaming cascades, lingers to smile at the heavens in flower-strewn meadows, laves emerald banks where golden cowslips bloom, and finally plunges into West River, which empties into the Sound.

Part of the section of country through which this stream flows is the town of Bethany, a place of 700 inhabitants. This population is widely scattered, for it is strictly an agricultural district. Here are the Woodbridge Hills, famous for their delightful scenery. The stream flows through the valley partly formed by these hills on the west, and the West Rock Range on the east. I know a story connected with this stream, and the spirit moves me to tell it to *FOREST AND STREAM*.

One beautiful May morning two men, armed with rods and lines, might have been seen crossing the fields and heading for the West Rock Range from the Hamden side. They were both tall and long of leg. One, however, traveled easier than the other, because he was more used to that kind of exercise. He who had had the least practice was a well-known New Haven druggist. The other person was myself.

H. stopped under a blossom-laden apple tree, tipped his straw hat to the back of his head and said: "Whew! This is new work for me." He mopped his heated brow, sniffed a good draught of the blossom-scented air, and continued: "How far is that brook, did you say?"

"Three miles, at least, from here."

"And we'll have to climb that range?"

"Certainly."

"Humph! How long will it take to get there?"

"Forever, if we stay here."

H. mopped his heated brow again, and we started on our way. The climb to the top of the range was enervating, even for me. My druggist friend is not a strong man, and he was ready to lie down when we reached the top of the range. As I felt somewhat that way myself, we rested awhile, then descended the western side.

Our way now led through emerald fields, where dew-drops sparkled on grass blade, violet and buttercup. The sweet songs of bluebirds, robins and wrens filled the scented air, and the morning sun kissed the newly foliaged hills with a tender touch. A soft breeze breathed out of the southwest, and toyed with the snowy apple blossoms, bringing sweet incense on its wings.

About 8 o'clock we reached the banks of the brook. Here we found large gangs of men building a huge dam across the valley at that point. This was for the purpose of forming a large artificial lake for the New Haven Water Co.

H. was my invited guest, and I advised that he begin fishing rooyds. or so ahead of me. I helped him rig his line, and when I was ready to fish he was out of sight down the brook. I feared that the commotion of the men building the dam might have scared any stray fish from that vicinity, but decided to start in near them and trust to luck. A beautiful cascade, about 8 ft. in height, fell over a small ledge, and was shattered into a mass of creamy foam on the rocks below. It then rushed into a deep, dark pool, and a likely looking spot was this for trout. It was here I first wet my line, but fish as faithfully as I would I could get no strike. Pulling the tops of my hip boots up as far as they would come, I commenced to work my way cautiously down stream. Many likely looking spots were patiently tried before success crowned my efforts. Finally a spot was reached

where the banks grew steep and compressed the water into a narrow channel. At the further end of this channel the water poured into a swirling pool. Beyond the pool the stream was a succession of rippling rapids.

Failure to secure a nibble made me careless. I had come to think there were no trout in the brook. Therefore it was an agreeable surprise, as my bait swished over the miniature fall, to catch a glimpse of golden lightning as it flashed in the dark water of the pool. Then there was the unmistakable song of the reel. I let him have the bait a short while, then struck. He proved to be a nice little fellow of $\frac{1}{4}$ lb. Two others were induced to come to creel here, and each one was a trifle smaller than the first.

The ripple yielded four, but three were under the limit, so I returned them to the water.

For the next 400 yds. the stream was a succession of swift rapids and quiet pools. The banks were lined with a heavy growth of pine, chestnut, oak and hickory trees, and the sunlight fell through the bright young foliage on the pools and ripples in golden patches. I had fished this stretch for perhaps half its length; then I came to where the stream swept in a long, shallow rapid to the right and tumbled into a deep hole under the roots of a number of large trees. "Ah!" thought I, "here, surely, is a spot where the big ones live; now, if H. hasn't caught them all, I'm in for sport."

I fished this place very cautiously for a full half hour, then began to lose heart. It seemed that there surely must be fish there. In fact, it was the most trouty-looking spot on the brook. Time after time I allowed my line to drift down with the current and fall into its dark waters, but all to no purpose. Finally I gave up, and was about to start on down stream, when I detected lightning-like gleams flashing through the waters of the pool. Upon closer examination I was surprised to observe eight or ten large trout dashing through the water in all directions, and either a muskrat or mink among them.

The water was about 6 ft. deep in its deepest part, and I could see quite plainly, but hardly plain enough to distinguish whether the animal was a mink or muskrat. Whatever it was, it was quite deep in the water. I saw it make three or four dashes among the trout, but the fish seemed not to be much frightened. If they had been frightened it would have been an easy matter for them to have dashed either up or down the stream. Finally the animal disappeared under the roots of the trees. I tried to poke him out with the rod, but without success. I have always been puzzled as to whether the animal was really after the trout. If so, did the fish know they could easily avoid him, and were they having some fun with him? Who can tell?

Continuing down the stream, I met with varying success. The trout bit well, but ran small; too small, in fact. I took none over $\frac{1}{4}$ lb. in weight, and threw many back that were under size. I took enough to add spice to my outing, and really cared more for the bright spring sunshine, the sweet, blossom-scented air, the happy songs of the birds, and the ever-shifting shadows of the woods than I did for the fish. Had I to dispense with either, I would say: "Take the trout and leave me the rest."

From the time we began to fish I had seen nothing of H. I knew he was somewhere ahead of me, however, and about noon I came upon him; he was sitting on a log on the bank and appeared to be about worn out. "Hello!" said I. "What luck?"

"Oh, I have a few. I would have caught more, I think, had I fished more carefully." He had about as many as I, and none of them were larger.

"Did you take any from the pool under those large trees?"

"No; I fished it awhile, but didn't get a nibble. There were no fish there."

He was surprised when I told him of what I had seen. "I noticed nothing unusual about the pool at all," said he. "I let my line drift in a few times, then came on down stream."

We voted to have lunch and rest awhile. It was delicious out there in the free woods under the trees that bright spring day. The soft breeze fanned our heated faces and toyed with some wild geraniums growing near, which bow and nod in a stately way. Butterflies flitted here and there and bees sped by on droning wing. A robin regaled us with a burst of melody and two gray squirrels frisked among a bed of golden cowslips near the edge of the brook. The brook rippled a mellow lullaby, which was so conducive to sleep that we were overcome and did nap just a little.

After an hour's siesta we started off on the business of the day again. A dark, heavily wooded ravine was before us, and H. insisted on my fishing ahead of him; this I would not consent to. Trout streams are handy to my door; I can fish them any day in the proper season. I knew that H. enjoyed no such privilege, and I proposed that he should experience the pleasure of taking as many trout as possible. After persistent urging on my part he started in rooyds. ahead of me.

A bend soon hid my companion from view and I fished cautiously along behind him. Great pines hid the sun, and few rays of light penetrated this fissure of the hills; it was damp and gloomy there. The stream rushed noisily along, its bass echoing along the ravine's dark sides. Now and then a black, white-faced swirl, or an inky, limpid pool yielded a trout, but owing to their small size few found the creel. I followed the stream through the ravine for nearly an hour, and it was so damp and cold that I became thoroughly chilled. A dozen times or more I decided to let the fishing go and hunt the sunshine. Then some alluring pool or ripple would come in sight and the temptation to fish it would prove irresistible. I finally reached the end of the ravine, and found that here the brook widened out into a long, shallow ripple, which danced and sparkled in the sunlight as if happy to escape from the gloom and darkness of the ravine. The ripple ended in a small mill-pond, where the water was still and deep.

From the spot where the ripple entered the pond I took over a dozen trout. Not one of them, however, proved to be up to the limit, and all were returned. This spot seemed to be the ending place of our day's sport, for a dam spanned the brook just below, and I knew the stream was posted beyond the dam.

I found H. enjoying a sun bath. He had selected an emerald grassy mound for a couch and round about were sprinkled those diminutive forget-me-not-appearing blossoms,

which are among the earliest spring flowers. Here we emptied our creels, and the little speckled fellows showed to good advantage as they lay side by side on the bright, green grass. They were all above the limit, but not one would weigh $\frac{1}{2}$ lb.

"Well, H.," said I, "shall we fish on below the dam until we come to the signs, or shall we quit now?"

"To tell the truth, I've felt like quitting ever since we had our lunch. I dread the tramp across the mountains; yet the sooner we make it the sooner it will be over." He certainly looked tired.

"Very well. But so long as the shortest way to the road is by the brook, I'll try a couple of spots below the dam. You can wait for me by the bridge."

The dam is of masonry, and a sawmill stands by its side. This dam is about 12 ft. high, and I tried the rough water at its foot without success. A small pool just below yielded better results, for I took two trout there, and each weighed about $\frac{1}{4}$ lb. Then I joined H. at the bridge.

It was nearly 3 o'clock when we started to cross the mountain. I never saw a more tired man than was my companion when we finished the four miles to my house. Supper and a six-mile drive home through the fresh, blossom-scented air of the spring evening, however, refreshed him so much that, when I bade him good night at his gate, he declared his intention to try it again some day.

My string counted nineteen that day, and H. took home fully as many.

WILLIAM H. AVIS.

HIGHWOOD, CONN.

The Yellow-tail Season.

SANTA CATALINA ISLAND, April 11.—*Editor Forest and Stream:* The fishing season has opened at Santa Catalina, California; that is the summer fishing, and the gamy yellow-tail is testing the rods and lines of Eastern anglers in Avalon Bay, and the members of the Tuna Club are getting their rods and tackle ready for the fray, which begins when the first flying fish are seen.

Santa Catalina is a delightful sort of a place, picturesque, romantic, a big mountain range, lifted out of the sea, with deep cañons and sheltered bays; the ideal spot to while away a summer in; the shores are abrupt, great walls of rock rising one, two or four hundred feet or more directly from the sea. And it is along these shores that your boatman rows you when after the gamy yellow-tail that lurks along the kelp beds, singly and in schools. It is difficult to persuade yourself that you are eighteen miles out to sea, so calm is it, so glass-like the water, and I never can quite convince myself that I am not being rowed around Grenadier Island on the St. Lawrence by Bill Massay, my old oarsman, instead of Jim Gardner or Mexican Joe, of the yellow-tail belt. The north coast of Catalina, which is twenty-two miles long and sixty miles around, is the favorite fishing ground, abounding as it does in quiet bays and still waters, clear as crystal and deep—deep as the unfathomed caves of song.

The yellow-tail has no Eastern (Northern) prototype, though he recalls the bluefish, and is a cousin of the little pilot fish of sharks. Some call him the white salmon, and he is the salmon of southern California. They are really very far removed, being *Seriola dorsalis* of the books. He averages 17 lbs., but attains possibly 100. The largest fish I have seen weighed 62 $\frac{1}{2}$ lbs.; but one was caught at the island last year which, when cleaned and headless, weighed 80 lbs., and this I assumed must have been very near a 100 lb. fish, as the head of such a fish is enormous. The yellow-tail is a beautiful creature, with eyes soft, liquid and beautiful as a woman's. Then its colors are radiant as spring flowers; the median line, tail and fins a golden yellow, the upper surface in the water a rich green, the central surface a blaze of silver. But as it comes in on the gaff it becomes a veritable hummingbird; its back blazing with colors, an iridescent turquoise now, labradorite blue prevailing.

It comes first in March in great schools, then divides up into pairs and small groups, and is a sociable fellow, often crowding the boat and reveling in the ripple at the stern post within arm's reach, while the smelt bait is dragging 70 ft. astern. Sometimes he will not bite, and no fish is cleverer in distinguishing a hook, certain old "sea lawyers" defying the skill of all comers. Again, when "chummed" they bite eagerly, and when the strike comes no one can mistake it. Sometimes it is a gentle nip; sometimes he fondles the bait and rubs his nose against it, but more often takes it with a rush that makes the reel scream in agony and carries 50 or 100 ft. of line away before he can be stopped. The rods most in use are of short greenheart with slender tips, but stiff enough to lift a sulking 20 lb. fish; the reel, a good multiplier, such as the Vom Hofes and Conroy make, indeed their reels, while expensive, are the only ones which seem to stand the violent work. The line advocated by the Tuna Club is a 15-strand, and while I have taken large fish on a smaller one, a line of this size is necessary to lift a fish which becomes entangled in the weeds or kelp. The reel should have a leather pad, in fact, is useless without.

So equipped in either a rowboat or one of the many power launches of Avalon Bay, we move slowly away; all at once the water is seen to be covered with fins, and a yellow hue tints the surface, and glancing down into the blue depths they are seen to be filled with fish. There were thousands of all sizes, but they would not bite. A mile further in, beneath high cliffs, the reel suddenly rings out its alarm—zee—zee—zee—and away goes feet and yards of line with a rush that warms the cockles of the angler's heart. An old salmon fisher who knew Loch Nass said no salmon ever made a braver fight, and if the truth were known, salmon tackle would be a plaything for a yellow-tail; and it would be a long and tiresome play before he could be landed. The fish in one splendid burst took 200 ft. of line, then was stopped, to plunge down and sulk. Then he rose, coming it fast, to break away again in fine bursts of speed. Twenty minutes slipped away before the silvery gleam of the yellow-tail could be seen, and it was half an hour before the gaff slipped beneath its belly and the noble fish slid into the boat. In the course of an hour two more were caught, and finally the boat was surrounded by a school of rock bass, white fish and yellow-tails, biting eagerly; and it required much moral force not to keep on fishing so long as the fish were biting. But we were satisfied with five yellow-tails apiece

for the day, all of which were well won, ranging from 17 to 30 lbs.

The yellow-tail is the all-round game fish of this region; he comes in March and remains until Dec. 15, and sometimes is here all winter, as in 1897. In April, May and June the white sea bass comes along, a fine game fish, with a maximum weight of 80 or 90 lbs. The record of the Tuna Club, which the writer has the honor to hold with light rod, is 50 lbs., though, perhaps, Mr. Beard has beaten this in former years. The club record for yellow-tail is 50 lbs., held by Frank V. Rider, Esq., of New York, honorary secretary of the Tuna Club. In May and up to July 15 the leaping tuna runs, and probably no fish has created quite so much excitement as the noble creature whose home winter and summer is about this island. In June the black sea bass runs, and bites, and he runs into October. The largest rod catch is 327 lbs., by Mr. Rider.

It may be interesting to true sportsmen and those who are making war against unsportsmanlike ways, to know what has been done in California by one club. When the writer first visited Santa Catalina Island, rods were unknown, and for several years, yellow-tails and other fine game fish were hauled in on hand lines. One launch, as an example, with a load of "pot-hunters" with four hand lines out, would bring in a boat load of fish, which would be thrown on the beach or towed out into the bay and fed to sea lions and sharks. The rod was introduced, and the idea was impressed upon fishermen that no sportsman or gentleman would fish with any but the lightest tackle that gave the fish the advantage and made it impossible for a man to take more than three an hour. The force of example of men of prominence had its effect, and to-day the Tuna Club, whose members have accomplished this work, have the gratification to know that the finest fishing ground in America is fished in a legitimate manner. The president of the Tuna Club at the last annual meeting made the following statement, which will interest every lover of the rod:

"It affords me much pleasure to report that as a result of the efforts and example of the Tuna Club and its members, unsportsmanlike methods have, to a large extent, been eliminated from these waters. When a few years ago one fisherman would, by trolling with two or three hand lines, bring in forty or fifty yellow-tails, sea bass, etc., magnificent fish, ranging from 15 to 50 lbs., which were often towed out into the bay and thrown away, the same person will now, by using a light row, be satisfied with six or eight, and as each fish taken with the rod plays for twenty minutes or more, the sport is greatly increased. The professional boatmen have heartily co-operated in this work, and now use the lightest tuna, yellow-tail and rock bass rods, reels, lines, etc., and the reckless, wanton waste of game fish is rapidly becoming a thing of the past, a change so marked that the members of the Tuna Club deserve the warmest congratulations from lovers of true sport and humanitarians the world over."

To still further encourage this idea, the club this season gives an open tournament, in which valuable prizes are given, from cups valued at \$100 to rods of the finest description, twenty or thirty prizes in all, the only restriction being that all fish must be taken on lines not over 21-strand and light rods.

The following are some of the classes, the prizes not having been all decided on:

Tournament Sea Angling, May 1 to Sept. 1.

Class A—Leaping Tuna (70 to 200 lbs.).—1. For exceeding the club rod record of 183 lbs.: Prize, gold medal. 2. For the largest tuna of the season other than the above: Prize, silver cup. 3. For second largest: Prize, rod and reel. This remains the property of the club, the name of the winner being engraved upon it, and will be contested for every season.

Class B—Black Sea Bass (75 to 500 lbs.).—1. For exceeding the club rod record of 327 lbs.: Prize, silver cup. 2. For largest fish other than the above: Prize, rod and reel. 3. For second largest fish: Prize, reel.

Class C—White Sea Bass (20 to 60 lbs.).—1. For exceeding the club record of 50 lbs.: Prize, silver medal. 2. For largest fish other than the above: Prize, bass rod.

Class D—Yellow-tail (15 to 60 lbs.).—1. For exceeding the club rod record of 50 lbs.: Prize, silver medal. 2. For largest single catch other than the above: Prize, gaff. For second largest fish: Prize, yellow-tail line.

Class E—Rock Bass (3 to 12 lbs.).—1. For the largest fish taken: Prize, bass rod. 2. For second largest fish: Prize, reel. (Rods 8 to 100 z.)

Class F—Bonito (8 to 13 lbs.).—1. For the largest fish taken: Prize, rod. 2. For second largest fish: Prize, reel. (Rods 8 to 100 z.)

Class G—Casting.—1. For the longest cast, tuna rod and bait (flying fish): Prize. 2. For the second longest cast: Prize, rod. 3. For the longest cast with yellow-tail bait (smelt not to exceed 6 in.): Prize. 4. For the second longest cast: Prize, automatic reel. 5. For longest cast, rock bass rods and bait (sardine), 10 or 12 oz. rods: Prize, gold medal. 6. For the second longest cast: Prize.

Class H—Professional Boatmen.—1. For the best equipped small boat, with or without power, for tuna, yellow-tail or black sea bass fishing; rods, gaffs, lines and general equipment to be considered: Prize. 2. For tuna of over 70 lbs. brought to gaff and landed single-handed (angler to manage boat also), 24-strand line or less: Prize. 3 (a). For the longest cast with tuna rod and bait (flying fish): Prize. (b) The longest cast with yellow-tail rod and bait (small, 6 in. or under or any recognized yellow-tail bait except fly-fishing): Prize. (c) For second longest cast: Prize. (d) For longest cast with rock bass rod and bait, 10 or 12 oz. rods: Prize. Casting events in this class to be determined July 4, if possible. 4. For best exhibit by any professional boatman of rods, reels, lines, gaffs, boats, etc.: Prize. 5. For fastest and best equipped power launch for general fishing purposes: Prize. This event to be determined July 4.

Judges will be the executive and weighing committees of the club. In professional events boatmen will select three judges not club members to act with the committee. All records shall be determined by weight of fish at the weighing, no allowance for loss being made. All fish must be brought to gaff unaided.

A fishing tournament in which prizes are offered for largest fish, where the avowed purpose is to protect the

fish, is perhaps a novelty, but the Tuna Club, by encouraging the use of light rods and lines, has accomplished its purpose. No fish are wasted, the catch is reduced and the sport vastly increased. Five years ago there was no demand in this section for fine rods for sea angling. To-day there is hardly a fine rod or reel maker in the country who is not represented at Santa Catalina, and the tackle of professional fishermen whose stands line the beach of Avalon Bay and those of their patrons represents hundreds of dollars. SENOR X.

Florida's Fishing Interests.

THE Florida Fish Commission, John Y. Detwiler, chairman, and John G. Ruger, secretary, have made their annual report to the Governor. We quote in part:

The fisheries of the State of Florida are among the most important industries, by reason of the enormous quantity of food products already provided by nature with a lavish hand, and which will be amply sufficient for all time, if properly protected from wanton destruction and vandalism. For this purpose has the present Commission of Fisheries been appointed; and as such Commissioners the responsibilities resting upon the members are of no small magnitude, when it is realized that from Fernandina, on the Atlantic seaboard, thence around to Pensacola, on the Gulf Coast, together with the various lagoons, bays, inlets and rivers, our waters abound with marine life sufficient for all time, if proper measures are employed to restrict and govern the methods of taking it. A due recognition of this fact, and a dissemination of this knowledge to the public, would be of great importance and add to our population.

In the prospective work of the Commission of Fisheries, the essential features to impress upon the public mind is the extent and area of the waters comprising the public domain of the State, and its relation to the entire population. The next is to convince the thoughtless and law-breaking element among our citizens that their rights exist only in their imagination, and are but an unreasonable privilege which they exercise, and that an antagonism to the State law will result in punishment. He who acknowledges the law and conforms to its provisions in all things is in harmony with it, which results in both public and private welfare. A citizen who usurps a privilege belonging to another or to the public, and uses it for selfish motives, should be restricted by force, if necessary. With no precedents established for this Commission to follow, it remains with them to execute as best they can that which is for the public good.

As it is presumed the Commissioners of Fisheries are to be the head of that department, it of necessity requires the assistance of wardens to enforce the laws made and provided for the preservation, protection and propagation of the various fish and shell fish industries of the State, which the necessities of the case require. As statistics are of the greatest vital importance in any industry, the control of the entire commercial fisheries of the State should be subject to the Commissioners of Fisheries by authority of the Legislature, and blanks should be provided for information relative to the capital invested, the boats, nets and persons employed, the varieties of fish taken, and the disposition of the same—whether marketed in a fresh or cured condition—and other data as to the habits, nature and desired protection, all of which should be preserved for future reference.

Of the fresh water lakes, rivers and ponds which are within the State, it is suggested that due attention be given to their feasibility for food production, and that provision be made for personal examination as to the adaptability of further stocking them with fish suitable for self-preservation and reproduction, whereby the public may be benefited, and, as soon as practicable, the more important be stocked with such species of fish deemed most suitable to the conditions that exist. The practice of catching perch and other fresh water fish during the spawning season and wantonly throwing them away is a serious offense. While it is sport in a sense, it is carried too far in this wanton waste and should be prevented.

It is recommended that provision be made to introduce shad into the fresh water rivers, by procuring them from the U. S. Fish Commission, until our waters have the benefit of and maintenance of a suitable fish hatchery. The Commission, from the position they at present occupy, see no valid reason why this important matter should be further deferred, and would recommend that the Legislature memorialize the United States Government to establish such fish hatchery as may be suitable.

Intelligent immigrants usually investigate the resources of the section of the State they wish to make their future home. This important fact should not be lost sight of by those who are empowered to enact the laws, for it stands to reason that the food resources of a locality are of as great importance as those of an educational or social nature, and it behooves our representatives not to disparage the advantages of the State to the detriment of her future financial prosperity, by the allowance of an inadequate appropriation for all purposes whereby the fisheries may be encouraged, policed and protected.

Of the turtle fisheries, stringent laws should be enacted, and vigorously enforced by heavy penalties, for the wanton destruction of the loggerhead and green turtle while depositing their eggs on the sand beaches of the ocean, and suitable restrictions also made as to their capture for commercial purposes.

On the sponge industry, it is presumed under the fostering care of the General Government, which demonstrated the practical and successful cultivation by means of sets of clippings in the extreme southern waters of the State, it will receive the proper protection and encouragement it so richly deserves.

In this connection, though not strictly within the province of the Commissioners of Fisheries, we call your attention to the fact that some legislation should be taken in regard to the preservation of the manatee, whose presence is occasionally observed in the waters of the Halifax and Indian rivers. These animals, if not protected by stringent laws, will soon become extinct.

The wanton destruction of our egret rookeries has resulted in the depletion of our streams and marshes of these beautiful birds of plumage, and we would recommend that all birds of the heron family be protected by

law against destruction in any manner for a period of years.

Of our game of various kinds, the laws protecting them now in force are no doubt satisfactory, if properly enforced, which could be done with economy by consolidating the Commissioners of Fisheries to act as Game Commissioners also, as is done in other States, where both departments are consolidated in the same commission.

Florida contains 59,268 square miles of land, and over 1,200 miles of seacoast, which is greater than any other State east of the Mississippi River; and by virtue of her position between latitude 24 degrees 30 minutes north and longitude 80 degrees and 87 degrees 45 minutes west, possesses varied advantages second to no other State in the Union in their amount and variety. The food products of both land and water are so vast and include such an area in which both the salinity and temperature of the water are so entirely different, that the conditions are not equal at the same season of the year. Therefore your Commission call special attention to the fact that legislation to apply to one locality is inappropriate to another.

With Rainbow Trout in Southern California.

To see the early amethystian sun tints on the mountains to the west is the first requisite to a day of trout fishing from Redlands, Cal.

Mount San Bernardino has, perhaps, translucent clouds hanging like attendants about his iron and alabaster crown; his breathing thus tempered with spruce and snow reaches us as we emerge on the Santa Ana plain; the prairie is odorous with white sage and lupine in purple racemes, and the golden chalices of California poppies dash the dry, coarse foliage. The Western meadow lark tilts rollickingly from the top of a mesquite bush and his gurgling attempt at a song sounds like the errant notes of a drunken pianist; the Californian towhee darts slyly in and out of a rose hedge, and the mocking bird, which has just closed his night song, now begins with an additional glad note or two that of the day. His song is not so full-throated and versatile as that of his brother in the Southern States. The greater number of singing birds there, on whose notes he so successfully speculates, is the natural explanation of this.

But the reader could not be more anxious for the point of this article to be reached than we were to get to fishing—Mr. Oliver and I. Alder Creek, a tiny and lipping tributary to Santa Ana River, up the cañon of which we were winding, at last invited us to try its waters. The alders grow lustily and to the height and diameter of sycamores; flowers, grass and ferns soften the footfall, and the stream purls as gently as could be wished. My companion carried his seventy-five years with agile leaps from stone to stone, and in great enthusiastic strides, his kind face beaming expectantly.

Within a mile, one feeble catch, but of lawful measure, brought out the impression, before slightly suggested, that we were no longer men, but boys, and that this stream, so weak, shallow and empty of fish, was really the one of our youth, where we had gone so often, the fagged enthusiasm of each closing day patched up and inflated by the night's golden dreams. My friend had evidently had these lovely visions of the coming day all his life, for his face, as he proudly drew out his prize for my comment, made Time, I am sure, turn away from his reaping in sheer astonishment.

Further on is another stream, which was scarcely allowed to speak for the water cress—it had doubtless entertained too many gossiping water nymphs. Here I was charmed at the prompt response of a large trout to my offer of courtesies. In water of zin, and clear as glass he discussed the point with much deliberation, but his eyes were fascinated, and his wavy body shaken with delicious uncertainty. My rod trembled, and the alders against which I leaned gave forth uneven pulsations to my breathing. But at last my worm wriggled at the right moment and he died more gracefully than a king in purple robes. Mr. Oliver was as pleased as I, and went at once and put in his hook at the same place.

We went on and on up the rocky defile, past the great power house, which furnishes electricity for the Los Angeles car lines (and where thousands of fish are said to be electrocuted), and soon had reached the end of the wagon road. Here we stopped naturally, boiled coffee on a rail and spread lunch (not under the trembling cottonwoods by the river's bank, as I should have liked, but by reason of contiguity—to Mr. Oliver—under the roof of a dingy workmen's camp).

During the three hours of the afternoon left we had fair luck on Bear Creek, and a number of fine specimens flashed their gold and saffron sides from foaming pools.

At this considerable elevation from the valley the air on such an April day has a tonic and buoyant effect, and one feels like wandering on forever down and down, responding with a cast to every brawling and hearty call from the stream.

In returning to camp I started a pair of the American dipper (*Cinclus mexicanus*), which fidgeted and pattered about before me for some distance.

The five hours of home-coming was not the least of the pleasures of the day. The stars, evidently jealous in this latitude of twilight's veil—for they appear so quickly after sunset—were from the start our quiet pilots, and then, the following of Mr. Oliver's stream of talk was as good as any of one's luckiest piscatorial days. He is a forty-niner and a miner, had lived in a cañon and officiated in every other capacity except as father to "Clementine." But this I forgave him, as he talked so delightfully of the early camps and fine Indian raids.

At Mentone, a rustic dance, seen through open windows, gave some reflection of its happiness, and at the Casa Loma, in the city itself, other revelers in the dancing parlor sat at their midnight luncheon. Here one queenly guest was evidently in content with the world. An acknowledged dispenser of good things, no doubt she had gathered around her a brilliant little court, but I regretted to note that the blood-red carnations shining in her dark hair were evidently taken by her vieing rivals more as symbols of Mars than of Psyche.

EDGAR MAGNESS.

The Pennsylvania Fish Protective Association.

PHILADELPHIA, April 22.—*Editor Forest and Stream:* The annual reunion and banquet of the Pennsylvania Fish Protective Association was held at Dooners Hotel, Tenth and Chestnut streets, Philadelphia, on Friday evening, April 7, and proved to be one of the most enjoyable for years. The large banquet room was handsomely decorated with the national emblem, and patriotic music was discoursed by an orchestra during the evening.

The fishing interests of Pennsylvania, New York, New Jersey, Maryland and Delaware were represented, making the occasion a notable gathering, and the central point of all the addresses was the importance of these interests, representing millions of dollars, which were involved in the harmonious and effective methods now being introduced to preserve the edible fish in these five Middle Atlantic States. After grace by the Rev. H. O. Gibbons, an excellent menu was discussed. Dr. Bushrod W. James, president of the Association, then welcomed the guests and delivered the following address:

Annual Address by Dr. Bushrod W. James, President.

In presenting an annual address before this Association it appears only fitting to make reference to the history of the organization of the Pennsylvania Fish Protective Association, to those who have favored us with their presence this evening.

In the fishing season anglers are fond of wandering away in the direction of the pure mountain streams and smaller rivers for the sake of the sport afforded by angling for the game food fishes, that naturally abound in the waters which run in various directions among the lovely hills and valleys of this beautiful State. But year after year these sportsmen found their pleasure tours becoming less attractive and enjoyable, through a scarcity of trout and other finny denizens of the water, due to the fact that a system of protection for such fishing streams had not been legislated consistently. Few of the counties, they found, had no local protection laws at all, while others adjoining either had feeble protection laws and customs, or those they had were not co-operative or in harmony with their neighboring counties, and by this means at last streams that once abounded with choice fish were discovered to be entirely sterile of the beautiful swimmers.

Investigation and exploration explained the fact that residents of the contiguous counties had depleted the trout, bass, pike and pickerel streams and creeks by the indiscriminate use of fishing nets, fish baskets and other exhausting devices, thus taking any and all kinds of fish from their haunts, and even their spawning places. It was also found that detrimental and injurious material had been turned into some of the streams, poisoning the fish and rendering them unfit for food. By such means anglers were eventually prevented from obtaining their favorite sport during their tours for pleasure or recuperation.

A number of merchants and retired gentlemen, to whom the fascinating pleasure was thus denied, called a meeting for the purpose of forming an association or organization, whose chief object was the formation of laws for the restoration and protection of edible fishes in all the streams throughout the commonwealth of Pennsylvania, as well as aiding and encouraging the enforcement of the laws then existing for the same purpose. They also aimed at pointing out the defects in the law of the State and of the different counties; and they made propositions for their adjustment, thus creating a new interest in the sport that was quietly waning for the need of those protective measures.

Through the activity of the late Andrew M. Spangler and his friends this society was organized on Nov. 13, 1882, at the southeast corner of Broad and Fairmount avenue, in a building then called "Lincoln Hall," it having since become the site of the Lorraine Hotel. The name selected for the organization was the "Angler's Association" and subsequently called the "Angler's Association of Eastern Pennsylvania," and it immediately started out fervently and did considerable valuable work in the way of improving the laws relating to the fishing streams. After about three years the members thought it essential to future success, as well as for the good of their own interests, to obtain a charter. This they accomplished on April 10, 1886, when a constitution and by-laws were formulated and adopted, and the society started upon a broader basis of operation. The original name was retained until Feb. 8, 1890, when it was given its present suggestive title, the Fish Protective Association of Pennsylvania, the object being to extend its benefits of propagation and protection of valuable food fishes to every part of the State. A first great objection to this organization was that it appeared to the rural citizen that it was instituted for the sole benefit of wealthy sportsmen, having a purely selfish and ungenerous motive in preventing the old usages resorted to by local individual sportsmen, as well as the more wholesale catching carried on by companies in the larger streams and rivers. But as time wore on, many who had thus objected discovered their misjudgment and yielded to the wise arrangements that would eventually accrue to their personal advantage, as well as to that of the whole commonwealth.

Gradually protection by law was universally acknowledged to be beneficial, for during the necessary investigations the true state of affairs became more apparent, when it was discovered that in many streams, once swarming with desirable fish, there were not left a sufficient number of any kind for natural procreation, and the society was compelled to avail itself of the provision offered by the United States hatcheries to restock with the young fry of the most valuable edible varieties.

In the meantime there were hatcheries erected and operated advantageously at Erie, Allentown, Corry and Bristol, from which the fry were transported to the more distant streams and rivers in the interior and western part of Pennsylvania with peculiar success.

The society has taken great pleasure and interest in the formation of local societies and in the progress made by those more recently established. There is a fine prospect of still greater numbers of such societies being

formed elsewhere, as every indication denotes, that the former oppositions to the operations of this Association are nearly, if not quite, overcome by the evidence of its sincerity, and the progress its efforts have made in the direction indicated by its name.

Some time ago the society found itself ready to interest all the fish and game local organizations through the State, in having harmonious protective laws passed, and it was therefore resolved to ask the co-operation of all toward the furtherance of plans for the universal good of the cause. Here again there was temporarily a little hesitation by some in the proceedings, but the excellent work of the United States Fish Commission began to show itself in the great improvements that it inaugurated in edible fishculture, that public attention was compelled to yield respectfully to its better judgment as to the whole question as relating to State as well as United States fish propagating interests.

No one could then ascribe all to individual or even corporate selfishness, and the studious working out of various problems and difficulties, and the patient and finely conducted experimentation and the consequent successful issue perfected by the United States Commission, and even our own State Fish Commission, in selecting, propagating and planting such notable varieties of such fine edible fishes as salmon, trout, perch, pickerel, bass, pike, pike perch or lake salmon and many other varieties.

This has once for all overcome the fears expressed by men who have always depended upon the denizens of the water for their maintenance.

So far from the work having reached perfection, however, there is much to be done. Mistakes have been made and losses sustained, but scientific research and well-founded experience will gradually pave the way to future improvement in every direction. One of these errors was the importation of German carp, a fish whose few good qualities are found since their introduction to be sadly over-balanced by the evil. They were planted and carefully guarded with the impression that they were not rapacious, that they were excellent table fish, and that they would supply a long-felt deficiency. They have, to the contrary, shown themselves to be voracious to the extent of clearing out at least some of our creeks of every good fish; they are gross and poorly flavored after they reach maturity; and perhaps one of their worst features is that they keep the creeks and rivers, once beautifully clear, stirred up with mud almost through the entire year. An old fisherman on Perkiomen Creek was asked how it was that Neshaminy and Perkiomen creeks were always muddy, once having been noted for their clearness and beauty. He frowned, and emphatically stated that the German carp caused this result, and they not only did that, but they cleared out every other variety of fish. They weigh from 2 to 10 lbs., and often more, and they have literally no other taste except what one should imagine belonged to earth or rank weeds. Even the boys who love to fish do not now carry the carp catch home, because they cannot eat them, however carefully prepared. Of course, there are people less fastidious, but undoubtedly, as a valuable acquisition to our fisheries, carp is a signal failure. This is becoming widely known, and there is a suggestion to not only permit fishing for that fish at all times, but to supply the streams infested by them with such fish as we believe the pike and perch to be, which are particularly fond of carp eggs and fry. Local interests yet have considerable weight in many quarters, and there are some who even object to the elimination of the marauding fish, but in time all adverse influences must yield to the positive proof of right in the direction of even culture only of good variety food fish.

Education in this undertaking is just as essential as in any other improving enterprise, and it has therefore been conceded, after many failures, that certain varieties of fish require to be planted in particular locations. For instance, brook trout requires cool, clear and pure spring water and it will not flourish in any other. Other fish are not quite so dainty on that point, but they must have warmer or cooler runs, as their nature demands. The food supplies are also to be considered with regard to planting the young, and special care must be used in selecting species and in avoiding long-continued heredity of each also; also to prevent the mixtures of natural enemies, which succeed finely when kept apart, but annihilate oftentimes other good varieties if mingled in the same stream. Another peculiar item is to propagate fish that will live in a large percentage after being planted. For it has been shown that black bass, for instance, will not thrive very well by artificial propagation of very small fry; therefore the rivers should be stocked with healthy well-grown specimens.

A question that must in time excite careful study and special co-operation in the local societies is whether streams can be over-stocked, and in that event is there any danger of reaping disaster in diseased fish. The idea is suggested to me by the knowledge that there are certain species of fish in Alaska and in the Yellowstone Park Lake that are subject to disease. In the former place the quantities taken by the natives fall far short of the supply afforded, and the animals, especially the Alaskan salmon, actually swarm at certain seasons by the million, involuntary protection having permitted their perpetual increase. In the Yellowstone Lake they are as strenuously guarded from destruction by being a Government reservation under military supervision. The point for thorough research is to discover whether the disease arises from over-production and crowding, or from hereditary taint, or from special disease peculiarity. In any case, it would seem wise to remove the infected fish from the rivers and restock them with healthy fish of their natural habits. Just at this point I wish to express my opinion with regard to the reputed infectious nature of the water supply of this city. If the water was thus foul enough to produce a typhoid fever epidemic, we would infer that even the fish taken from such water would infect anyone who partook of them as food or handled them carelessly. I would say, therefore, that, most decidedly acknowledging the impure condition of the waters for drinking uses, and the necessity for the prompt and efficient cleaning of every reservoir, that typhoid fever germs have or have not contaminated. But the fatal and infectious disease was imported into our city and homes and hospitals by the various hospital au-

thorities bringing hundreds of suffering soldiers from the unhealthy military camps, not only from the far South and the West Indies, but from near-by infected camp hospitals. The typhoid germs there sown have harvested over 5,000 cases and over 500 deaths. In regard to the cleaning of the reservoirs, I believe it very wise to at any rate, at a very early day, remove the impure sedimentation, including the dead fishes, with other effete matter. After this necessary cleaning has taken place and legislation has compelled the cessation of emptying refuse into the river, there need be no further trouble, and there is not a doubt that the planted varieties of fish will thrive and become quite valuable.

Heretofore, the question of the protection of fish has not been properly considered by many of our States as an item toward increasing the revenue of the commonwealth, but the time must soon arrive when it will not only be known by the Pennsylvania Association, by all and every local society that a joint and friendly co-operation will not only increase the actual food supply by furnishing delicious, healthy and abundant specimens, but the revenue of the whole commonwealth will be increased very materially.

I have spoken of propagating and supplying the fishing streams, but the matter of protection has not been accomplished quite so satisfactorily. The fish wardens have been extremely faithful, but there are not a large enough number to make their duties perfectly efficient, however faithfully performed, nor is their remuneration large enough to make the position of warden desirable. Public streams have so long been regarded as public property that fishermen and boys have persisted in breaking the laws which they cannot be convinced are for their future advantage. But by slow degrees the societies are succeeding in showing them their errors, and we have every hope that in the near future the difficulties will be entirely subverted. We note with satisfaction the passage by the Legislature of the act imposing this service. We have gained a most wonderful impetus toward our desired progress by the union of the societies for the protection of game and the Forestry Association, who have all shown perfect willingness to act in harmony with our own efforts for the protection of all the natural resources of the State. One must have a salutary influence upon the other, and eventually our country will be not only more wealthy but more beautiful, and greater pleasure and profit brought about for our citizens.

Allow me to offer a few suggestions.

1. I would suggest that this Association request the earnest, hearty and mutual co-operation of every other Eastern State, the friendly arrangements existing between ourselves, New York and New Jersey certainly proving the advantage of such a procedure.

2. The present slightly strained relations regarding the fisheries in Lake Erie would be readily adjusted by some such arrangement.

3. Every experiment instituted by any other society, and particularly by the United States Fish Commission, should be followed in each detail, and the profit of this would soon be shown in the better progress in the business made without each State being compelled to go through some experimentation.

4. Increase not only the number of fish wardens, but give them better pay for their work, and when practicable, enlist the police to give their protection and aid when required.

5. Carry on the war against illicit fishing until everyone understands that he must respect the legislation toward relieving the fisheries from all danger of destruction.

6. Continue experiments in planting different varieties of fish in various locations and watch carefully to note the most successful results.

7. Always be careful to discriminate so as to prevent the varieties from being placed so that they may interfere with the growth and propagation of the more valuable species.

8. Always place the young fish, or the mature, as the case may be, in streams in which they will find abundant supplies of their natural food.

9. Let every member of this society feel it imposed upon himself to further the interest of the Association in every way in his power.

10. And let everyone promulgate the fact that the interest of the Association is not only to increase the number, variety and quality of the fish, but to add millions of dollars to the revenue of the State.

11. Bring about and maintain unity of action in all societies throughout the State and encourage the foundation of many new local protection organizations in every part of the commonwealth. In union strength is fostered.

12. Every lover of a choice table menu, with its fish list, should aid by their membership and financial support and personal efforts for a good set of protection laws.

Toasts were responded to as follows:

"The United States—Our Country.—In 1776 we assumed among the nations of the earth a separate and equal station. In 1899 we occupy the most exalted station among the nations of the earth." Responded to by the orchestra playing "The Star Spangled Banner," those present standing in their places and singing our national song.

"Pennsylvania—Our State.—We still maintain our position as the keystone in the arch of States, the most important of them all." Responded to by Hon. Levi Morrison, of Greenville, Pa.

"Philadelphia—Our City of Brotherly Love.—Let brotherly love continue." Responded to by Rev. H. O. Gibbons.

"Commissioners of Fisheries of Delaware."—Responded to by Commissioner Dr. E. J. Shortledge, of Wilmington, Del.

"Commissioners of Fisheries of Maryland."—Responded to by Commissioner A. T. George, of Swanton, Md., who gave a very interesting account of the work being done by the Maryland Commission, at the conclusion of which those present sang "Maryland, My Maryland," accompanied by the orchestra.

Letters regretting inability to attend were read from the Commissioners of Fisheries of New York and New Jersey, and others prominent in fishcultural work.

"Commissioners of Fisheries of Pennsylvania."—Responded to by Wm. E. Meehan, as follows:

Address of W. E. Meehan, on behalf of the Pennsylvania Fish Commission.

This reunion gives me particular pleasure, because, aside from the usual enjoyment which such gatherings bring with them, it is indicative of bright days ahead for the State Fish Commission. The fortunes of the Pennsylvania Fish Commission are the fortunes of the Pennsylvania Fish Protective Association. Its triumphs or its perplexities are the latter's glories or trials. In the perpetual struggles of the Pennsylvania Fish Commission to secure efficient legislation, the Pennsylvania Fish Protective Association is always to be found shoulder to shoulder with it in the same cause. In all the efforts to promote the maintenance and increase of fish life the Fish Commission finds itself encouraged and sustained by the Association.

Two years ago when, by an unfortunate blunder, the Legislature adjourned without making the usual appropriation for the work of fishculture, the Pennsylvania Fish Protective Association was the first to whom the Fish Commission turned for help, and it responded promptly, energetically and effectively. Other associations and citizens came to the rescue also, and to them all the Commission gladly acknowledges its debt of gratitude, because through their efforts it was possible at least to perform some fishcultural work.

I remember well a remark made by a member at one of the meetings of the Pennsylvania Fish Protective Association, when the need of the Fish Commission for funds was being discussed; they deserve to be written where they may be imperishable. He said: "The Commission must have this money. To give it I am in favor of selling the pictures on the walls, or mortgaging all the possessions of the Association if need be to furnish it." This sentiment, I believe, was felt by every member of the Association, for deeds proved it. It was not necessary to sell the pictures, but a generous fund was raised, nearly one-third of all received, I think, by the Commission. There was self-sacrifice, too, because the pleasant annual reunions, I understand had to be suspended until such times as the Fish Commission should again be on its feet. I have cause therefore for feeling more than usual pleasure in meeting you to-night, for it is evidence that the sun is rising again on the fortunes of the Fish Commission.

Because of your sympathy, because of your deep, unbounded interest in the Fish Commission's work, I feel it is due you to give an outline of what that body has done during the past two years, and what some of its plans are for the near future, and I cannot but express the hope that the showing will demonstrate that notwithstanding the unusual difficulties and perplexities which have been encountered, and the great loss sustained through the death of its honored president, the Hon. Henry C. Ford, there has been a steady progression of work, and if nothing untoward happens, the reputation of the Commission will still be respected throughout the country.

At the conclusion of the twelve months of the fiscal year of 1896-7 the Commission had hatched and planted over 164,000,000 food and game fish, the heaviest work done in any year of the Commission's history. Of this number only about 4,000,000 were purely game fish, the remainder being shad, pike-perch and whitefish for commercial purposes. This output was one-eighth of the entire output of the United States Commission the same year. Then came the blow to the Commission's work through the unintentional forgetfulness on the part of the Legislature to make the usual appropriation, but with the sum of \$6,000 raised by the association and citizens the Commission did what it could. Only the trout stations could be maintained, and over 4,000,000 trout of different species were hatched and planted last year. Anticipating the early passage of a deficiency bill by the present Legislature, a much larger number of trout were hatched this winter than usual for distribution, so many more, in fact, that it was deemed wise to make preparations to temporarily place a portion in retaining ponds until the proper planting time arrived. There were in fact nearly as many brook trout alone raised this winter as the aggregate formerly of all species. Unfortunately, there was an unexpected and unavoidable delay in the passage of the deficiency bill, and the planting of the overplus of fry was stopped on account of funds running out. Then came the blizzard and its unusual severity, together with the overcrowding and other causes, the entire hatching of fish, over 2,000,000 in number, died. This would have been far more serious than it is had it not been for the large supply at the Corry station, 2,400,000 in number, of brook trout. From the number of applications out, and through other sources provided for, the Commission feels it will be able to supply all reasonable demands. The runs are now being made from the Corry station, the warmer counties being first selected.

I am pleased to say that the Commission has during the last two years done remarkably good work in the direction of planting Atlantic salmon. Last year 100,000 were planted in streams tributary to the upper Delaware, and this spring 250,000 were deposited in the Lackawaxen and Dyberry. This is the heaviest planting ever made in one year, and with the 100,000 planted last year makes a total of 350,000 for the two fiscal years, the heaviest for any two fiscal years in the history of the Commission. The nearest approach to this work was in the fiscal years of 1891-92, when 300,000 were planted while the Hon. Henry C. Ford was president, and which resulted in the great run of salmon in the Delaware in 1895-96. The catch in the first year was valued at about \$3,000, and in the succeeding year at over \$5,000. If the same results follow last year and this year's planting there should be a big run of salmon again in the years 1902 and 1903.

For some time the Commission has been planting for the propagation of other valuable food and game fish. Chief among these may be mentioned the black bass, rock bass, yellow perch, white and calico bass, Lake Erie sunfish, pickerel and mascollonge. Indeed, the ponds for the last-named fish are now being constructed at Corry. These ponds will not have great capacity, for lack of room, but they will be large enough to maintain

breeders, which will furnish eggs sufficient for about 50,000 fry. The Commission prepared to use the \$5,000 a year, hitherto used for the different species of bass, in the establishment of culture ponds, and afterwards the same sum annually for their maintenance. Several sites were offered by land owners at a nominal sum for this station, but unfortunately the plans in this direction were checked by the Legislature feeling itself obliged to cut the appropriation by \$10,000. This act rendered it hopeless to establish an independent site and go into the propagation of the fishes named on the large scale contemplated. The loss of the fry at the Allentown station has, however, opened a way, perhaps, out of the difficulty to a small extent. A plan has been formulated for submission, but as it has not yet been formally brought before the board, I do not feel it would be proper for me to more than to indicate that there are such plans for a partial solution of the difficulty.

Another work the Commission is considering, which, when it is completed and carried out, will doubtless have a strong influence in aiding the cause of fish protection and in extending the knowledge of fish life throughout the State. This is the propagation of goldfish for object-lesson teaching in the public schools. The superintendents of education in several localities have signified their approval of the plan proposed, and the work will be commenced to a limited extent next fall. Requisitions have already been made for the greater part of the estimated supply, and if the experiment is successful, as there seems every reason to believe it will be, the Commission will make arrangements to supply every school-house in the State where the fish will be useful.

At the beginning of the present session of the Legislature the Fish Commission presented a bill for the better protection of fish. With two exceptions the bill embodied, it is believed, the sentiment of every friend of the increase of the food fish and game fish supply. Feeling, however, that it would be impossible, in view of former opposition on the part of certain elements among the fishermen along the Susquehanna River, to pass the bill without some concession, a conference was held with them, and as a result two sections were regretfully inserted to permit the use of certain devices surrounded by proper restrictions. These restrictions were agreed to by representatives of the elements mentioned. But faith has not been kept. An alleged representative in the House of Representatives introduced a bill to permit the use of fish baskets, fyke nets and set lines in the waters of this commonwealth almost without any restrictions, and caused the Fish Commission's bill to be amended to conform to this measure. The Fish Commission feels that it would be better that the whole bill should be defeated than that this amendment should become a law, and it has so instructed its friends in the House of Representatives. There is also another amendment made to which I think it is my duty to call your attention. It is that the trout season shall close on June 15 instead of July 15. It would be much better if the season should be made to close Aug. 1 and open May 1 than that the amendment now made should prevail. It is, however, a measure which the Fish Protective Association should make a harder fight against than the Fish Commission, because if the Fish Commission acts it will be used as a lever against it to strengthen the absurd cry in the Legislature that the Commission is working in the interests of the sportsmen and not in the interest of the fish. They will certainly point out with specious force that the shortening of the season is in the interests of the fishculture: This is not true, of course, except so far as it is a fact that if there were no trout caught at all there would soon be full streams. The amendment if it passes will certainly do much to ruin the small summer resorts in the mountains.

"Forest Protection."—Responded to by Dr. J. T. Rothrock, Commissioner of Forestry, in a stirring and instructive address.

"The Water We Drink—The Water We Fish In."—We would have them free from pollution." Responded to by Dr. Benjamin Lee, of the State Board of Health.

"Game Protection."—Hon. J. H. Worden, Game Commissioner.

Entertaining addresses were also made by Hon. James McAnlis, Wampum, Pa.; Chas. F. Bartlett and others upon the protective features of fishcultural effort in Pennsylvania and the other States represented, followed with a liberal supply of fish stories. The reunion closed with the singing of "Auld Lang Syne."

The committee in charge of arrangements was composed of Wm. H. Burkhardt, Chairman; Edwin Hagert, Edw. A. Selliez, Henry A. Ingram, Wm. S. Hergesheimer, Wm. P. Thompson and Joseph B. Van Dusen, Jr. Among those present were Messrs. H. O. Wilbur, S. E. Landis, Walter Powell, W. S. P. Shields, Bernard L. Douredoure, George T. Gwilliam, W. P. Ogelsby, W. H. Ocker, W. C. O'Neil, Howard A. Chase, M. G. Sellers, Wm. R. Nicholson, T. P. Monroe, Robt. W. Fitzell, Marcus D. Cornwall, Dr. John R. York, George W. Shaw, E. T. Davis, Charles Wetherill, J. P. Collins and representatives from many local fish and game protective associations in Pennsylvania.

M. G. SELLERS, Sec'y.

Casting Records at Baltimore.

THE records made at the tournament of the Maryland Sportsmen's Exposition at Baltimore April 19 and 20 were as follows:

Fly-casting, fixed distance and accuracy: W. C. Goddard, 90 per cent.; Thos. Whistler, 85; H. J. Talbot, 83 2-3; C. N. King, 75 2-3. Accuracy, bait-casting: Jos. H. Hunter, 68 3/4 ft.; Thos. Whistler, 65 1/2; H. J. Talbot, 40; W. C. Goddard, w. Dry fly-casting for delicacy and accuracy: W. E. Goddard, 93* per cent.; Thos. Whistler, 92 1/2; W. J. Talbot, 92; W. C. King, 86 2-3. Bait-casting for distance and accuracy: A. F. Dusel, 72 ft. 9 in., score 97 per cent.; Jos. H. Hunter, 64 ft. 8 in., average, score 94. accuracy: W. E. Goddard, 93 1/2 per cent.; Thos. Whistler, 148 ft. 10 in., average, 168 ft., maximum; Hunter, 64 ft. average, 162 longest. Long-distance fly-casting: Goddard, 90 ft.; Dresel, 69; Whistler, 67.

The Brief is inimitable, and therefore perfect. It is a complete Vade Mecum.

CHARLES HALLOCK.

Retrospect.

THERE'S a spot far away that I think on to-day,
That I gaze on with memory's eye,
Where the fir, ever green, half encircle the scene;
Where the pine spreads his arms to the sky.
There's a bold mountain-side, where the echoes replied
To my boyhood's shrill laughter and shout,
And a path 'neath the ridge, winding down to a bridge,
O'er the brook where I caught my first trout.

Hastening on, from the hills come two clear, glassy rills,
Fresh and free from their crag-covered home,
And in darkness and day merry music they play
In their ripples and bubbles and foam.
From each ledge, lichen-crowned, all impatient they bound,
In their moss-fringed channels they run,
To a rock-basin deep, where the naiads might sleep,
There they blend their bright beings in one.

But a moment of rest, o'er the verge it has pressed;
On a gray granite terrace it shines;
Now it burrows its way amid boulders and clay
In a garden of cedars and pines.
'Neath an elm lying prone, by the tempest o'erthrown,
Through a stretch where the cherry trees bloom;
Then, a rush o'er a rock and a plunge and a shock—
It is down in the gorge and the gloom.

Now in wilder delight, dancing frothy and white,
O'er the glen's rugged steps hear it go!
Where the ferns at its side drink the sweets of its tide;
Where the birch and the tamarack grow.
'Mid the spray-sprinkled bowers, where pale forest flowers
Smile up, 'twixt the trees, at the sun.
How it chafes, how it churns; how it tumbles and turns
In the joy of its journey begun!

Ever downward it leaps, ever onward it sweeps,
And it knows neither doubt nor dismay;
Over rocks, under roots curl its crystalline chutes,
For it may not be barred on its way.
Through the pools deep and wide hear it gurgle and glide,
Where the trout loves to lie 'neath the shade
Of the wet, turf bank, where the grasses grow rank,
In the caves that the current has made.

There, tranquil at last, all its turbulence past,
It has found a fair couch for repose;
Through the meadow lands green, lily'd borders between,
To a murmuring measure it flows.
There it mirrors the day on its serpentine way,
Marked by many a broad-branching tree,
To the river below, dark and placid and slow,
That will bear it away to the sea.

How the years have rolled on! Half a lifetime has gone
Since last on its margin I trod,
But Time journeys in vain. I'm a boy once again
With my first little basket and rod.
Yes, forgetful of years, with their smiles and their tears,
I can feel the same thrill as of old;
I can see the quick flash, I can see the bright splash
When the lithe, speckled beauties—"take hold."

In the voices of birds there are mystical words,
There's a song in the stream at my feet,
Where each water-washed stone lends its silvery tone
To the symphony, soothingly sweet,
And the elves of the breeze, far aloft in the trees,
Tune the sun-lighted leaves as they pass;
While no gem-studded throne that a monarch might own
Could vie with the dew on the grass.

Oh, how oft in my dreams, on my vision it beams
With a radiance too bright for my pen!
And enraptured I list, in the morn's yellow mist,
When I hear that wild voice in the glen.
Though my footsteps have ranged, though the seasons have
changed,
Though the wintry wind whistles without,
Time and space are a blank; there I stand on the bank
Of the brook where I caught my first trout.

HARTSDALE, N. Y.

ED. LEGGO.

New England Waters.

BOSTON, April 22.—Few men have been better known in Maine rod and line sporting circles than Mr. Rodney B. Woodman, who died at his home in Boston last Saturday night. Born in Meredith, New Hampshire, fifty-four years ago, he early acquired a love of the woods and waters. Later in life, when he became a business man in the metropolis, none of this old love left him. Every season he made his early trips to Sebago and other Maine salmon waters, and was always one of the most successful. Time after time the FOREST AND STREAM has had accounts of his successes. Later in the season his trips for black bass and pickerel were most remarkable. He has fished nearly all of the bass waters in Maine; often with remarkable success. Short fishing trips throughout the season were much in favor with him, and doubtless one of the greatest disappointments he ever had to bear was when he found, a short time ago, that his health would not permit him to make his early trips this year. Always genial and self-denying, it was a pleasure to fish with him. He loved to talk fish and fishing, and his ideas were always practical and excellent. He delighted in telling stories and relating fishing adventures, and very frequently the FOREST AND STREAM has had his anecdotes; perhaps losing something of their wit—their pathos, it may be—through being told second hand.

Mr. N. B. Dana, one of the best known ticket sellers to where Boston sportsmen hie, never goes a-fishing. Oh No! He scarcely fishes at all! He simply goes out driving, and is careful to drive on a pleasant afternoon along some of the trout brooks in Sharon or elsewhere. He knows where they are. Then his little rod is in the carriage, and a few angleworms are in his pocket. He does not fish much, but jumps out of the carriage—the horse will stand all right—and whips a worm into the water. A trout jumps at the lure and is caught. Then, perhaps, another and another. He does not fish really in earnest, but somehow some pretty good strings go home with him in the carriage.

At this writing all the Maine lakes and ponds are locked in ice. Sebago is yet solid, fifteen days later than last year. C. A. Robinson writes, from South Windham,

that the ice cannot clear before May 1, and possibly not before May 5. Sunapee Lake, in the southerly part of New Hampshire, is not yet clear, though more than two weeks behind last year. O. W. Cutting writes, from Andover, Me., having just got word from Richardson Lake, that there is yet a vast amount of snow in the woods in that region. He thinks that the ice cannot leave the Rangeleys before the last of May. George Newton, who has guided for many years on Richardson Lake, has sent word out that the woods are still snowbound, with 2 ft. of soft snow and slush on the lake. He went in April 8 on snowshoes. A year ago the same lake was clear of ice April 3, and the snow about all gone in the woods. His idea is that the Rangeleys cannot be clear before May 20, and probably later. I have not yet learned of any salmon being taken in the Bangor pool, though the Penobscot is clear of ice above Bangor.

April 24.—The latest reports from Sebago Lake, Me., say that the ice is out of the mouth of the Songo River, and this is one of the first indications that the ice is soon to clear. L. Dana Chapman has word from a well-known guide on the Naples side that the ice is likely to be all out in a few days. Already the clearing of that lake is fourteen days later than last year, however. A number of Boston fishermen are looking anxiously for the ice to leave Sebago ready to try the salmon fishing. The latest reports from Bangor say that there is 4 ft. of water pouring over the big dam at Bangor, and still a great body of snow in the woods. The water is so high that nothing can be done in the big salmon pool below the dam. There are no authentic accounts of salmon taken there yet, though one of the Maine papers suggests the capture of one last week. Dispatches noting the beginning of the fishing are to be forwarded to a number of Boston sportsmen interested, and none have yet been received. A Mr. Allen, who fishes the Bangor pool every season, was here the other day, and he suggests that there can be no good salmon fishing till the great volume of snow water subsides. Several Boston fishermen fully intended to try the brooks in New Hampshire on the 19th, Patriots' Day here, and were early on the ground. In the vicinity of Nashua and Manchester they could do nothing. Their excuse on getting back to Boston was that they did not have picks and other tools with which to clear the brooks of floating ice.

The lateness of the fishing season is discouraging to the railroads, hotel and transportation men. They claim that they are losing at least two weeks of the best of the season. The reasonable angler is not much displeased, however, since he is aware that the supply of fish is neither great nor inexhaustible at any point, and anything which gives two or three weeks more respite to the stock should be reckoned a real benefit. When the ice does leave his short vacation can be put in with zest, and the feeling that the rabble has not already run the ground all over.

A Portland dispatch says: Ice out of Sebago. Fishing begun. SPECIAL.

CHICAGO AND THE WEST.

Spring Goods.

My friend, Mr. Mershon, of Saginaw, asks me to correct an error I lately made by a slip of the typewriter. He remarks, "Under the head of 'More Spring Trade' you say, 'The members of the Kinne Creek Trout Club, or more properly, the Flint & Pere Marquette Club.' I want to correct this. It is the Flint & Pere Marquette Railroad, but the Pere Marquette Fishing Club." This fact I knew, and should have stated correctly. The club receives its name from the saintly conduct of its members.

I am glad to note that the waters of Kinne Creek will not know any backset this year. The club transplanted over a thousand yearlings and a number of older trout, putting them in the hatchery pens to grow good and fat before going into the stream. The stream proper had 150,000 fry turned in out of the club hatchery.

Mr. Mershon goes on to give further facts regarding his territory, after his obliging and comprehensive way, and I feel obliged to quote from his personal letter:

"Our lumber buyer returned from a trip through northern Michigan the other day and reported that in on the Lewiston branch of the Michigan Central Railroad last Sunday at a dam on one of the streams that this branch of the railroad crosses, a moss back took about 140 trout, some of them weighing 2 1/2 lbs. These things make your blood boil.

"The days are warm and balmy once more, and the brook trout feeling prevades the air and enters into the very marrow of one's bones. I hope I can go up May 1 and fetch in a few of them, but I am afraid that business and half a dozen other preventatives will decree otherwise."

Early Fishing.

Our Western fishing season is now just beginning, or more properly, our trout season is just beginning, as witness a certain uneasiness daily increasing in the deportment of certain friends of mine, who are devoted to the pursuit of the brook trout. One gentleman with whom I fished last year has been in two or three times already to ask if I am "going up there again this spring," and if it isn't about time to be getting ready. I agree with him so far that I have already laid in my trout miliary for the spring, including some leaders of most excellent fineness, which, in an unguarded moment Pop Hirth, of Spalding's, sold to me. I surely will do business with those Prairie River trout this time, and when I get back I may have something further to say about the Taylor system of casting a fly. I have laid in a peck or so of flies, which, as it seems to me, ought to appeal to any self-respecting trout, and it occurs to me personally that trout flies never looked prettier than they do this spring.

Mr. Fred N. Peet, one of our most prominent anglers, dropped into my office the other day and showed me some new flies he has been tying. They were as exquisitely done as any I have ever seen executed by the best makers. Mr. Peet is a sort of all-round athlete in angling. He goes in for long range bait casting, can put a quadruple reel together in the dark, can cast a bait to all sorts of distances, and also maketh and loveth a fly. He tells me that he is going over to Grand Rapids, Mich., to tangle up with Mr. John Waddell on a tour for big

rainbow trout in the Pere Marquette River. He will make another trip about thirty days later, and I think it may be safely said that he will stop one of those big ones before he gets through. Mr. Waddell was Mr. Peet's host last June at the time of the Grand Rapids tournament, and he is thoroughly in love with everything pertaining to Grand Rapids and the Pere Marquette.

Fishing Wisdom.

I go to my correspondence box when I want something good, and just now I have in hand a letter from a fishing friend who is down at Louisville, Ky., confined to his room with gout. He writes to me to relieve his mind, if not his feet, and incidentally contributes several odds and ends of fishing wisdom which I take to be just the sort of gossip that sportsmen like to pass about among the circle. Thus he says:

"Who originated the cane-wound hand grasp for fly rods? I have always had a grudge for the inventor of that abomination. Many a man has found his hand badly blistered after fly-fishing for a few hours with one of these things on the opening day of the season. Yet the rod makers go on year after year and make rods with cane-wound butts.

"A cork-covered hand grasp is the thing for a fly rod. It feels good, will not get slippery when wet, and will not blister your hands. There are two kinds of cork hand grasps made, one being a thin veneer of cork about 1/8 in. thick, the other is made of rather thick cylinders of cork fitted over the wood. The last named are the best and most durable.

"Next to a cork hand grasp for fly and bait casting rods, I have found the cord-wound to be the most desirable. For winding the hand grasps of rods I have used the eighteen-thread cuttyhunk linen line that has been soaked in melted paraffine wax with a little resin added. The ingredients named should be melted in a waterbath (see your druggist about this). After soaking line and allowing same to cool, it should be drawn through coarse cotton cloth, held in the hand, until the surplus wax is removed from the surface. The line treated in this manner is waterproof, and will not get loose in consequence of contraction and expansion. Have never had one of these cord-wound hand grasps blister my hands. This kind of hand grasp is not as satisfactory as the cork covered.

"I am at a loss to understand why so many fly and bait casting rods are made with doweled ferrules. I have never had one of these rods that would not come apart just at the wrong time when casting. Dr. Henshall has written quite elaborately about the doweled rods and condemns them, yet people go on buying rods of this kind and learning by experience.

"I have seen a number of fly-rods with light standing guides on them instead of the usual loose rings. Parties using rods with the standing guides claim they are better than the other kind. Have never used a fly-rod with standing guides. Will some reader of FOREST AND STREAM who has had experience with both kinds give an opinion as to the comparative merits of the two kinds.

"When fly-fishing on streams I have found a light rubber cape a good thing to have in case of a shower. I always carry one with me. It weighs but little and has saved me from getting soaking wet quite a number of times. I should think it would pay some manufacturer to put a good quality cape of this kind on the market. The one I now have is of poor quality, and was made for bicycle riders. I had to cut it open at the front to adapt it to my requirements.

"When out on a stream for the day I carry a mackintosh cartridge bag, in which I put my fly-book and mid-day lunch, which are always dry, unless I happen to fall down, which rarely occurs. A mackintosh bag made especially for the needs of fly-fishermen would be a good thing. Am told that such bags are to be had in England.

"There are, so far as the writer knows, two styles of minnow-casting in vogue in the United States. One is known as the Henshall style, which is a graceful and easy way of casting when you have room to swing your rod. There are many places and conditions when it is impossible to cast in this style. I am under the impression that this style of casting had been in use in some sections of the country for many years before Dr. Henshall reduced to writing a definite description of it. As the doctor was the first to write a description of this method it is now generally known as the Henshall style. The other method of minnow casting, which is probably not so generally known, is frequently designated as the Chicago style, and is what might be called overhead casting. The writer thinks this style of casting has the advantage over the Henshall, in the fact that it can be made under conditions that would prevent one from casting in the Henshall style.

"The writer has never seen any printed description of the Chicago style in the papers and periodicals devoted to angling. A clear description of this method would probably be of interest to many readers of the FOREST AND STREAM. When two persons are casting from the same boat the Chicago style is much to be preferred. Probably the greatest objection to this style of casting is that it requires a somewhat shorter and stiffer rod than the Henshall method. The writer has tried 6 1/2, 7, 7 1/2, 8, 8 1/2 and 9 ft. rods for minnow casting in both styles, and has found that for all-around work a 7 1/2 ft. rod of 8 oz. about the most satisfactory. With this length of rod one can cast in either style with fairly satisfactory results, and have sufficient elasticity to tire a good sized fish within a reasonable time. In some respects, the best minnow-casting rod the writer ever owned was a two-piece Japanese cane 7 ft. 4 in. in length. This rod was light in weight, somewhat stiff when casting, but quite flexible and elastic when a good sized bass was hooked. I could make very accurate casts with this rod, and while it lasted, used it in preference to much more costly ones. I gave it some severe tests in the way of holding hard some large bass, but one day on the Kanakee it came to grief. In striking a small pickerel of about 3/4 lb. in weight the rod broke off at one of the natural joints, apparently as brittle as a pipe stem of clay. Rods of this kind are strong when new, but can not be relied on after the first season.

"I prefer the high arched antifriction guides on minnow-casting rods. They do not look so nice in finish as the so-called trumpet guides, but they do hold the line

up off of the rod so that it does not cut and fray the silk wrappings as much as when the other styles of guides are used.

"For minnow-casting in the styles named, a first-class quadruple reel is the cheapest in the long run if it is properly taken care of. If any one of a mechanical turn of mind will take apart a Milam, Meek or Talbot reel and notice particularly the construction of the pillars in connection with the ends, he will at once see one reason why these reels are so much more durable than many others on the market. I have often wondered why some of the large manufacturers have not "caught on" to this long ago. I know of a reel that is more than forty years old that has seen much service, which is a good reel today. If you have a fine reel, take good care of it, keep it clean and well oiled with best sperm oil. When out on a fishing trip clean and oil your reel at least once a week. For minnow-casting for black bass the writer prefers a hard braided silk line, half-way in size between a G and H. The last named size casts well, but is generally too weak to last one season."

If the writer of the above mention regarding the "Chicago style" of bait-casting will refer to files of FOREST AND STREAM dating back nine or ten years, he will find that I described the system rather fully in my department at that time. I think that it was myself also, without doubt, who gave this style of bait-casting the name of the "Chicago style," this appellation being given it in the FOREST AND STREAM and daily papers at about that time. This was before the organization of the Chicago Fly-Casting Club, whose work subsequently brought the method into greater publicity through tournament competitions.

Dog Sense.

PORTSMOUTH, Va.—*Editor Forest and Stream:* I have been very much interested in Mr. Mather's letters, and like him I believe that dogs do reason. I will give instances often occurring at my country home, in North Carolina, noticed by all the family and often commented on as showing a remarkable degree of intelligence for a dog.

My father always kept during his lifetime from twelve to eighteen foxhounds, which were his special delight. During the long winter moonshiny nights they could be heard for miles in full chorus after the wily gray fox, urged on by an occasional hallo from their master in such musical tones that it never failed to encourage them to renewed efforts. Neighbors around would join my father and enjoy the chase. It was impossible to follow the dogs on horseback, as that is not the proper way to enjoy a fox hunt. Some of your correspondents seem to think one should run his horse close up behind the hounds; but this would soon wind a horse. A good hunter on a good horse can manage to course his hounds and cut them off by some short route and be within a quarter or a half mile of them when they cross a road or field. And the music of a pack in full cry is much sweeter when wafted to you on the still night air from such a distance than when very near. Many and many a fox's hide have I stripped and stretched on a board and sold to furriers in my boyhood days; and then cooked the fox in meal for the hounds. My brother still keeps up the hunting proclivities of the family at the old homestead and has a nice pack of hounds.

But I started out to write about reason and instinct. The hounds showed some reason by never attempting to follow my father to church nor anywhere else when he was dressed in his Sunday clothes. A bird dog named Frank, as good and as fine an English setter as was ever wrapped in dog hide, played the principal part. During the long summer months the hounds would do little else than lounge around in the shade during the heat of the day; and almost any evening late Frank could be seen going from one sleeping hound to another licking their mouths and getting them on their feet and jumping around them in a most friendly manner. Then he would go toward the fields, and if they did not readily follow, he would return and repeat his dog tactics; and he never failed thus to get a good number of them off to hunt rabbits. He would hunt as industriously as the hounds until a rabbit was started, and as soon as it was started Frank could be seen to run around and get between the hounds and the briar patch and watch for the rabbit. He seemed to know they would make for the thickest place, and often would catch the little rabbit and eat it before the hounds could get there. If it was a grown one the hounds would be in time to share the feast. This looks much like reason to me. If it was instinct it is of a high grade article, verging on to human intelligence. Frank was a good dog, loved by all the family and the neighbors. He would hunt for anybody, and after the hunt was over would return to his master, regardless of distance. He was also a good catch dog for hogs and sheep. The family often allude to him in endearing terms. He lived to good old age, and finally had to be killed, and is gone where good dogs go.

Another instance of a dog's reasoning. My brother had also a black setter named Jack, that followed him wherever he went over the farm of several thousand acres. Sometimes my brother would forget to feed Jack after finishing his own breakfast and would leave immediately on horseback on his daily rounds over the farm. Jack would run to the cook and whine and jump up on her until she fed him; and I have often noticed him while eating hurriedly to stop and run to a back door to see which way his master would go. A road ran east and west by the house to a river west of the house, which ran

north and south, and followed its banks to a canal and down the canal to another road leading directly from the house. If my brother took the straight road to the bridge Jack would follow without completing his breakfast; but if he went the river road Jack would complete his breakfast and go down the road to the bridge and wait for his master. Now it looks as if the dog reasoned thus: "My master has gone to the river, and as usual will cross the canal at the bridge, so I will take a short cut and meet him instead of taking such a long run to overtake him."

Most any day Jack would lose his master while running rabbits, and as my brother would go a zig-zag route among the different crops, instead of following up the horse's tracks Jack would go to a brick kiln on an elevation on the farm and see where his master was. Jack would only own one master; he would not follow nor hunt for any one else. He, too, was a good catch dog. By some means he was poisoned and died a premature and hard death.

Such instances as the above were frequent occurrences there and were witnessed by many and were not considered rarities for well-bred and trained bird dogs. But since I've been living in a city and seeing well-bred and well-trained dogs, I note that they do not show the self-reliant air and independence, cunning, sagacity and bottom of the open-air-bred dogs in the country, that are taught to mind when puppies and allowed the freedom of the fields, so that when they are large enough to stand a day's hunt with the gun they are well acquainted with the location of the birds, and it only requires a whipping or two to prevent them flushing when the birds begin to run.

Let us have some more of "Ole Virginia," they are rich and racy; but tell Mr. Hopkins not to let them be rare. TAR-HEEL.

Editor Forest and Stream:

I have been interested in contributions to FOREST AND STREAM regarding dog reasoning power, and though I do not often take the trouble to write when not compelled to, my gratitude to the old dog, whose friend I am, impels me to add a little to the testimony in the dog's favor. A down East fox hunter recently sent you a letter describing fox hunting as practiced up his way, which is the way I have known it done. Fox hunters who prefer to ride horses and do without guns would change their preferences if living along the headwaters of the Delaware River, and they would soon learn that it requires more skill to kill foxes there with a dog and gun than it does to have them run down by a pack of dogs. I once bought a young hound out of imported English stock, and very soon got all I wanted of fast-running dogs, and promptly let a man who fancied that kind have Blaine, which was the rapid canine's name.

That dog repeatedly ran down and caught red foxes on bare ground in a run of four or five hours. He wasted no breath in barking, but put all his energy into his legs and would run half a mile in a minute or two, only barking a few times on the way.

The New England fox hunter describes my old dog so well that I have by his letter been induced to write this. Hunter is now twelve years old, and is getting to be as gray and deaf as his old master, and our hunting is probably about done. He was a slow dog, and would work an old track as long as he was left at it, or until the fox was started, but he got over a wonderful sight of ground when his fox was once in motion. He barked all the time, was never tired and never had sore feet, though he would generally run every second or third day, even though he went hunting alone. He was part black, part brindle, with yellow head and legs, and not very long ears—not half as fancy looking as hounds I have owned not worth comparing with him. In all his life he has never done a mean thing, which I can hardly say for his master.

This dog was raised in Delaware county, and when a year old I took him to Wyoming county. There he saw a big flock of sheep in a field the first time he ran out after the wagon on a Sunday afternoon. The dog ran across the field, and the sheep huddled together and acted so strange that the pup went up to investigate. The sheep ran and the dog ran after and barked. He soon got a whipping and would not come within reach of the wagon until he got home. The next week the experience was repeated and the dog took in the situation. After that he would leave the road and take to the fields on the opposite side if there was a flock of sheep in sight, nor would he notice sheep if he were hunting and passed them in the field or woods.

In the spring of 1892 I concluded to move to Sullivan

county, and chartered a car in which were loaded household effects, horse and wagon, the dog and myself, who went along as man in charge. We started about noon Thursday, passed over four railroads and arrived at our journey's end about 7 o'clock Saturday night. The dog was given his liberty, and within five minutes was running a track in hearing of the car, which was sidetracked. Several times between that hour and 11 o'clock the dog came to the car, and finding it in its place, went back to his hunt. About midnight the car was run to a chute, where the horse could be unloaded, and the dog soon found it. All day Sunday he was about, and Monday the goods were put into a building for storage. The dog was on hand, followed the last load in and lay down among the stuff. The next afternoon about 3 o'clock the horse was hitched to a cart and the dog taken in, when we started on a fifty-mile drive. The frost was just coming out of the roads, and we could not travel faster than a slow walk, and after going fifteen miles, stopped at a farmhouse for the night. When the horse went into the barn the dog went into the woods near by and was soon barking on a fox track. I could not call him off with the horn, or the track was evidently too fresh to leave, and so I went to bed. At 11 o'clock he was running in hearing, but next morning was gone. I spent the day looking for him, advertised him in several local papers and went on without any dog. He had been seen running a fox during the day, but that was all I could hear of him. I went back to the place where the goods were stored, but the dog was not there. A week after reaching my destination the dog was sent me by rail. He had gone back to the stuff after his hunt was over, and remained about, hunting part of the time and returning to look for his master and food, but it was some days before he could be caught. A child finally went up to him and took him by his collar.

Did that dog's "instinct" send him back fifteen miles to a place that he had never seen except for two days? Was it instinct that told him to return to see if the car he had ridden 400 miles in was waiting for him? Was it instinct that told him that when the goods were placed in storage that must be his home?

No matter what it was that taught him. The same power taught him not to venture far from home for a long time alone, and he was careful not to get left for months, until he finally located a permanent home and saw his master's family settled in it.

COLD SPRING HARBOR.—April 18.—*Editor Forest and Stream:* In your issue of April 15, p. 295, W. Wade says: "Occasionally you will meet one like Rev. Chas. Josiah Adams, who believes strongly, but can admit weight in an argument against it. But generally the type of your various anonymes is the ruling one."

I have not the pleasure of an acquaintance with the Rev. Mr. Adams, of Rossville, Staten Island, or I would write to him and ask him to interpret the above quotation.

Again, he writes: "A sample error is that of De Canibus, with the dog that carried the cat to the rat hole. On that one incident, without any investigation into previous experiences of that dog, he deduces reasoning powers. Would any reasonable man arrive in a similar way at conclusions as to another man's acts?" etc.

Was it Talleyrand who said that "Language was invented to conceal one's thoughts"?

I confess that I do not see just where W. Wade is at.
DE CANIBUS.

The Cleveland Dog License System.

A DOG-LICENSE law had been in force for some years in our city, with its usual results. Animals were shot in front of their homes by the police. A gentleman told me he saw a dog coaxed out of the arms of a poorly dressed little girl and shot almost at her feet.

Those that were put in the dog-pound and drowned aroused the sympathy of the curious crowd. "It is an outrage," said one man, as he saw an immense Newfoundland struggling among the smaller dogs in the water.

Mr. C. M. Munhall, a prominent business man, and a member of the Kennel Club, had seen poor women come tremblingly to the city offices to pay the license of some pet creature which they held in their arms. The owners were not able to pay the fee, but could not see their pets killed.

"The poor should not keep dogs," say some. It is useless to argue with a certain class in the community, who think the poor have no place nor rights in this world.

Mr. Munhall, reasoning that a dog is "property," presumably in every State in the Union, as much as a horse or a cow, determined, if possible to "restrain the city from killing dogs." He employed a lawyer, a test case was brought—his dogs were not killed, as he was too well-known—and a "perpetual injunction" was obtained against the city. The license law was of no effect after the decision was rendered.

"The course I pursued," says Mr. Munhall, "is the only way to wipe out such illegal laws." If other cities would follow his example, through some man or woman who is a friend to animals, we might be spared the yearly slaughter of thousands in some of our large cities. Mr. Munhall obtained this injunction eight or ten years ago, and thereby proved himself a public benefactor. Nobody complains of surplus dogs here, except some persons to whom two dogs in a city are too many!

A prominent vivisector here has urgently advocated a dog-pound to "prevent pet animals from straying into the colleges, and it would give the latter a regular channel through which their material might be derived."

In this city of 400,000 people we have no more "mad dog" scares than in those places where license is rigidly enforced. Neither the city nor the Humane Society obtains money through the death of innocent animals, and the poor keep their faithful companions.

A letter lies before me from a well-known Ohio man, who has sixty dogs in his kennels. He says: "I love dogs—all dogs—and believe that they have all a right to live, and that no law is a just one that allows them to be killed by any society or any person. I believe in hu-

mane societies for the good they do, but it is not good they do when they destroy the life of any dog or other animal, unless said animal has been hurt or is diseased and cannot live."—Sarah K. Bolton in *Journal of Zoophily*.

Maryland Sportsmen's Exposition Association's Field Trials.

LAST week the Maryland Sportsmen's Exposition Association gave a true exemplar of the proper manner of conducting a field trial. There have been many trials held before, but these were rude, unrefined affairs, held far out in the country, where there were open fields and wild woods, wherein the birds bred, lived and had their being. This was at a stage of sportsmanship when men were unrefined and primitive, and therefore when what they did do or did not do was of the past, and when men were not properly equipped in the ethics of true sportsmanship.

As to the true manner of conducting a field trial, one must first discover a large city, and thereafter, if he wishes for the full meed of success, he must discover a reasonably smooth park, with its modern landscape gardening, all close to said city. Your correct modern shooting is of the park and not of the wilderness. Birds and dogs which are not of this standard are of a dark age or a long distance from town. In either instance they will not fulfil the requirements of a great educational exposition, such as Baltimore has had the great good fortune of witnessing, unless they forsake their obsolete ways.

The Field Trials.

There was a good number entered in the trial. The running was done just outside of the park, on a piece of ground almost devoid of cover, which of course was as it should be. There was a strip of woods adjoining this, but this was too thick for the dogs to show any speed or style, and the woods should therefore be removed. Furthermore, the birds were not of the kind that made good work possible. They were shipped from somewhere in the South, and those that survived the trip were in a dazed, droopy condition. Of the 400 that were purchased for the trials we are informed that nearly half of them died en route. Prior to a brace of dogs being ordered out for a run, a few of these birds would be liberated on the open ground. Most of these birds would squat right where they were put out, and never move until walked up. In this way they emitted but little scent, and of course made it difficult for the dog to secure a point, which was entirely the fault of the bird. Naturally covey points, where coveys did not exist, were out of question. The few dogs we saw run performed very commonplace. However, due allowance should be made for the conditions they had to contend with and the new theory of what they were there for.

The All-Age had fifteen starters. The Amateur Stake has twenty-seven entries.

The real manner of testing a dog's finding abilities has thus been proven to be on new lines distinctly different from the old. First, you buy your birds, turn them loose a few at a time adjacent to the city, and your real field dog is he who will point a weak, half-starved bird in a new cover. This has been tried before by many field trial clubs and every time it proved to be a failure, which shows how old-fashioned and unreliable they were and how much more advanced are modern institutions which have the sports of the wilderness transported to the heart of the city, where they truly belong. The field trials were necessarily a success, for Gen. Corbin pressed the electric button which started the mechanical wheels and put the gate in official action.

There was also great interest in the whippet races, for there were many famous racers theretofore unheard of which ran the course in very fast time, which has not yet been officially announced through the press. It was a great field, consisting of some half dozen dogs. En passant it may be mentioned that the bird show was not a thing to be sneezed at.

In the free-for-all field trial there was a strong field of five. The thrilling character of the work is thus described by the Baltimore Sun:

"The first brace put down was Dr. J. McCormick's Jim Thompson and C. E. Coffin's Prince Boris. They started well and it was soon seen that both were under good command. Prince Boris found a bird first, when Jim Thompson was brought up to back. He did it rather indifferently, finally passing the pointing dog and caught the bird. When sent on Prince Boris had just about steadied down to a point, when his owner going to him put up the bird. Prince was steady to flush. On the first bird found Jim T. once scented, but passed on without locating it.

"After a short trial in the open C. E. Coffin's Faust's Dan and Monocacy Kennels' Ripsaw were sent into rather thick cover. Dan was first to find, and when Ripsaw was called up to back he was just about pointing the same bird, when it flushed ahead of him. Both dogs were steady to shot. Ripsaw next made a good find in edge of woods, and Dan, called up to back, scented the bird and pointed. Ripsaw was entitled to the credit of the find. Near by in the open, though in heavy cover, Ripsaw got a second point, steady to shot. After thirty minutes' trial they were ordered up, Ripsaw showing the best speed and range and each showing good nose.

"In the trial of L. W. White's Friday and P. C. Gorman's Rap it was setter against pointer, the pointer proving an accurate and fast worker. Rap was quickly on stylish point; Friday backed indifferently. Sent on, Friday found and pointed, Rap backing, Friday breaking to shot, with Rap steady. In next field Rap pointed, Friday backing promptly. The bird proved a running one. Rap did a beautiful piece of working in roading and locating 50 or 60 yds. away. Rap showed good form, working out his ground well, locating with accuracy, excelling in pace and range, considering the character of the ground."

Jim made a mistake in the first heat, inasmuch as he walked by and picked up the weakling. No doubt that man and gun will be adjusted to test their powers on these birds when these trials become universal and the old trials become obsolete.

Now to the third day. The thrilling struggle of this day is thus described by the Sun:

"The field trials of bird dogs were continued. They began before 10 in the morning with two brace, whose work did not compare very favorably with that of Tuesday. The first brace put down was Harry Bock's English setter bitch Hottie Molly, with G. L. Harrison's pointer dog Tip, of Consolation. The dogs did not seem to expect game until a partridge flushed before Tip. In next field Tip pointed a single bird and left it; Hottie Molly passed in ahead, flushed, and chased it. Sent on, Tip made game, and while being cautioned by the handler the bird flushed ahead. A few moments later he pointed a dead bird.

"The second brace was J. Bramble's pointer dog Bang, with J. Roger McSherry's pointer bitch Ripple. They showed better range and speed from the start. Ripple using her nose and hunting, Bang rather giving the impression at the start that he was only out for a run. The only game found was a dead bird that Ripple first pointed and then brought in.

"Owing to a mistake in applying the right names to a brace which ran Tuesday there was a mistake in describing the work between Rap and Friday. Friday did the better work and it was credited to Rap.

"In the afternoon the first series of the free-for-all, or professional stake, was finished, and one brace of the second series was tried. The first brace down was G. L. Harrison's pointer dog Sport C., with L. W. White's setter dog Ben. First came a false point by Ben, Sport backing indifferently at command. Sent on, the dogs were worked up the wind to a bird marked down, when Ben dropped to point, Sport backing. In the meantime Sport pointed a bird in a bottom below, Ben refusing to back. Sport was unsteady to shot twice, and did not take much interest in his work, but showed good nose when he happened on game. Ben showed good speed, but little style.

L. W. White's Ponce, a pointer dog, ran a bye, being the odd dog. He showed good speed, pointed once on game, but to other points claimed nothing could be raised. He seemed a little too cautious on scent. This closed the first series.

"Ripsaw, belonging to J. Roger McSherry's Monocacy Valley Kennels, and Friday, belonging to Dr. L. W. White, were selected as first brace in the second series, and both made a good showing both in speed and style. After working across the open to good cover in the woods Ripsaw first pointed stanchly, Friday backing promptly. Moving on, Friday pointed, when the bird ran, Ripsaw locating him again. Further down the ravine Ripsaw pointed, but was a little unsteady to shot. Returning to the open, Ripsaw pointed in sedge grass, the bird getting up wildly a moment later and settling in the open. The dogs were worked toward him, when Friday pointed stanchly. There was a good run before finding game again. Friday pointed, but, moving on, he raised four birds, which went to timber near by. Here he pointed again. The dogs were then ordered up and the work for the day finished. The last brace gave the large crowd that followed a good exhibition of field trial work."

The next day Ripsaw won first, Friday second, Prince Boris third and Faust's Dan fourth.

In the Amateur Stakes there were twenty-seven starters. The work was as one might expect on weak birds turned out near a park. Prince Boris and Faust's Dan won first and second respectively, Ben third, Pride of Baltimore fourth.

The Beagle Trials.

Again the old methods were found to be obsolete, the true manner of testing the abilities of a beagle on fur is to turn him loose on fish, so a red herring was used. The thrilling chase is thus described by the Baltimore Sun:

"Last night trials were made with beagle hounds, which chased scents made by dragging herring on the ground. The dogs followed the scent, but did not give proper tongue. Then a Belgian hare was taken from a crate and dragged over a course. The dogs gave tongue and ran true to this. When the hare was released he refused to run, but unconcernedly awaited the dogs until an attendant picked him up. A domesticated white rabbit was next tried, but he wanted to run back and play with the dogs. To-night a number of native wild rabbits will be turned loose, and they will give the beagle hounds a merry chase. These races will take place in the park."

If the hounds will not chase fish, "drag" a hare. The hare proving a failure, try a "domesticated white rabbit." If this should prove a failure, turn loose some wild rabbits in the park where the people will need to go through the gate and buy a ticket to view the thrilling sport as it does not exist and as no mawkish hippodrome can make it exist. No details of this feature are necessary, for they did not even approximate to sport, though they had a gate significance. Sport of the wild woods and the ticket seller's office of the city are antagonistic.

Continental Field Trial Club.

UNDER date of April 19 Mr. Hobart Ames, president of the Continental Field Trial Club, North Easton, Mass., writes us as follows:

"I am sorry to inform you that owing to illness Mr. W. B. Means has been compelled to resign as secretary and treasurer of the Continental Field Trial Club. Mr. Theo. Sturges has kindly consented to act as secretary and treasurer the remainder of Mr. Meares' unexpired term."

Points and Flushes.

The fame of the great pointer Von Gull, whose success as a field-trial winner holds a high place in the records, is being further perpetuated. A new brand of cigar, manufactured by Messrs. Hettermann Bros. Co., Louisville, Ky., bears his name.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Yachting.

The Royal St. Lawrence Y. C. One-Design Class.

WE are indebted to the designer, Mr. G. H. Duggan, for the accompanying lines of the new one-design class now building for the Royal St. Lawrence Y. C. Within the past four years this club has come prominently before the world as the successful patron of the smaller classes of racing yachts, its representative craft in the 15 and 20ft. classes, *Sothis*, *Glencairn I.*, *Glencairn II.*, *Dominion* and their numerous sister boats, being the fastest yet produced in their respective classes. With all the *eclat* and enthusiasm that has attended the repeated victories of these boats, the club has found it impossible to maintain among its members an interest in the modern racing machine, and only the necessity of a further defense of the Seawanhaka cup keeps the racing class alive. The expense of building, as carried on at Dorval, is considerably less than in the United States, and apart from some experiments in very light construction, the boats are as a class more serviceable and durable than those from the south side of the St. Lawrence; but with all this they are still too costly and generally undesirable to retain the interest of the yachtsmen of Lake St. Louis.

The new one-design class has been started to provide a fast boat, well fitted for general sailing and class racing under local conditions, but less extreme in type, less costly, more generally useful and more durable in construction; while not liable to be out-built in a single season. Compared with the small yachts of a few years ago, the design would still be extreme in form and sail area; but at the same time it is far abler than the latest racing type, and better fitted for the average sailor. The dimensions are:

Length—	
Over all	33ft. 6in.
L.W.L.	20ft.
Beam—	
Extreme	8ft. 8in.
L.W.L.	7ft. 3in.
Draft—	
Hull	10in.
With board	6ft.
Freeboard—	
Bow	2ft. 3in.
Least	1ft. 6in.
Counter	1ft. 8in.
Sail area—	
Mainsail	400 sq. ft.
Jib	120 sq. ft.
Total	520 sq. ft.

Gasolene Engines and Launches.—VI.

BY F. K. GRAIN.

(Concluded from page 297, April 15.)

SCRAPERS.—Very good boat scrapers are made by turning up the end of an old flat file and grinding to the required edge, wrap the hand end with cord or rag, otherwise it will hurt the hands if used for a long time at once.

PRESERVING UNUSED PAINT.—To keep white lead from hardening after the keg has been opened, fill or cover the lead with water.

PUTTY, CARE OF STAIN.—Putty placed under water will also keep soft. To make cherry stain, take burnt sienna and a little rose pink mixed thin with oil, turpentine and a little dryer.

BRASS POLISH.—To polish brass take any of the best makes of polish, apply with a piece of waste or rag, and after having stood for an hour or so, rub with a strip of cotton flannel, following afterward with silicon or whiteness, which will remove all the grease left from the polish and give a clean and brilliant luster. If you desire to leave your brass work without care for any length of time give it a coat of vaseline, using a new paint brush to apply it with.

PRESERVING OIL CLOTH.—Should the oil cloth in the boat show signs of wear or become dull, give it a coat or two of varnish, in fact, if you will varnish the back of your cloth when new, it will add greatly to its life, as the back part is first to be attacked by dampness.

STERN LINES.—It is well when the water is shallow or the boat lays around at low tide to put out a stern line or anchor, which will prevent the boat swinging or riding up and then resting on a fluke of the anchor which often results in a hole and a sunken boat.

FENDERS.—A very good fender to place on the stern of your yawl boat is the heel of an old rubber boot. Old garden hose with a rope of suitable length run through it makes a very fair side fender.

CABLES TO PRESERVE.—If you are using the same cable to anchor with continually, it is well to change ends every two weeks, as it will materially add to the life of the rope, giving one end a chance to dry out and preventing it fouling with slime, weeds, etc.

ROPES SWELLING.—Always remember in buying new rope that it will swell after being in use, therefore, if to reeve through blocks care must be taken to allow ample room for swelling.

BROOM.—Keep an old broom aboard to wash the mud off of anchor before taking on deck; it will save you lots of work.

REPAINTING.—If your boat looks dirty outside, don't repaint until you have scrubbed it with soap and water. Salt water soap can be had for that purpose; this may save you repainting, and the necessary loss of use and time, and in any case would have to be done.

KINKS IN ROPES.—To keep new rope from kinking fasten one end to a post or anything convenient, then stretch it out full length, pull as hard as you can all the while, turning or twisting the opposite way from which it is twisted, or in other words, unwind it. A little twisting and pulling will take some of them out, and it will be found to be quite pliable. Another good way is to allow it to tow astern.

NEW ONE-DESIGN CLASS, DESIGNED BY G. H. DUGGAN, ESQ., FOR THE ROYAL ST. LAWRENCE Y. C., 1899.

SAIL PLAN OF ROYAL ST. LAWRENCE Y. C. ONE-DESIGN CLASS.

FOULING OF PROPELLER.—If the propeller wheel gets wound up with grass or rope, it can generally be cleared by reversing the direction of the wheel. When a reversible bladed wheel is used it will be necessary, however, to turn the wheel backward by means of the fly wheel.

TILLER STOPS.—Always be sure to have stops placed each side of the tiller or yoke, otherwise in backing the rudder is liable to turn sufficiently to be hit by the propeller.

WATERPROOF CANVAS.—To waterproof a canvas cover paint it with equal parts of turpentine, raw and boiled linseed oil.

TOWING.—When towing alongside of another boat and ready to part company, always cast off stern line first, otherwise you are liable before you can cast off the stern line to swing apart, one boat then pulling sideways on the other, which often results in an upset.

MICA INSULATING WASHERS.—To cut new insulating mica washers, use two sizes of good sharp gouges, placing the mica on the butt end of a piece of hard wood.

CUTTING GLASS.—To cut glass, rounding or irregular shape, use a stout pair of shears, holding the glass under water while cutting. To cut india rubber, wet the tool with naphtha or water.

STEAM, WATER AND GAS PIPE.—Steam, water and gas pipes are made in sizes beginning $\frac{1}{8}$, $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$, $1\frac{1}{4}$, $1\frac{1}{2}$ and 2 in., and from that up, varying $\frac{1}{2}$ in. in size, the measurements being the inside diameter. All sizes up to 1 in. are butt welded, and above that, lap welded seams.

FITTINGS.—Fitting elbows, Ts, etc., are made of malleable iron, light weight for gas, ditto, heavy with reinforce around joint, and cast-iron for steam or heavy pressure. There are also steel fittings made, but not in general use. Brass fittings are made rough, dipped and finished. Brass pipe is made a hundred of varying sizes, both in diameter and thickness of metal, and as such is called tubing. It is also made of the same diameter and thickness as iron pipe, on which the same joint threading is used. This is called brass pipe, iron size.

IRON AND BRASS PIPE.—All iron and brass pipe is made of standard size, as are also the fittings, all using a standard thread of joints. To bend brass pipe or tubing, fill with melted resin, which will prevent its collapsing.

BENDING PIPES.—Iron pipe under 2 in. can be generally bent cold, unless the bend is very short, in which case it requires a special plant.

ANCHOR TRIPS.—If anchoring on rocky bottom always put a trip line on your anchor, otherwise it is liable to become fast under a rock. Take a small line, make fast to one of the flukes, then bury the free end. By hauling on this line the anchor can always be tripped without trouble.

TOWING YAWLS.—Be careful to make your yawl boat fast close up to the stern, also see that the free end of the painter is not overboard, otherwise you are liable to wind the rope around the propeller, especially when backing.

LIGHTS.—The lights to be carried by motor launches must conform with the rules of the Steam Vessel Inspection Service. For small launches they must consist of four lights.

A green light on starboard side.

A red light on port side.

A white light carried between and above the two former.

When at anchor a white or riding light must be carried on a pole as high as possible above the deck.

WHISTLES.—

If one whistle she should blow
To starboard then your bow must go;
And speeding on across the tide,
She'll pass to port along your side.
If two whistles she should blow,
Why then to port your bow must go;
And if the space is fair and wide
You'll pass along her starboard side.
From three short blasts 'tis yours to learn
That she is going full speed astern.

LIGHTS.—

When both side lights you see ahead
Port your helm and show your red.
Green to green, or red to red,
Perfect safety, go ahead.
When upon your port is seen
A stranger's starboard light of green,
There's not so much for you to do
For green to port keeps clear of you.

RIGHT OF WAY.—Boat first—Signalling secures right of way.

Affirmative—Answering signal should be same number of blasts.

Negative—Answering signal several short and rapid blasts.

One Blast—Steer to starboard, port sides passing.

Two Blasts—Steer to port, starboard sides passing.

Three Short Blasts—Going astern.

Salute—Three long blasts.

Distress—Continuous long blowing, or successive short

blasts; also turning flag upside down.

LAWS.—A copy of the laws governing the navigation of steam and motor vessels, with a great deal of other valuable data can be had gratis by applying to the nearest office of the Steam Vessel Inspection Service.

One Statute Mile—5,280ft.

One Nautical Mile—6,120ft.

AUXILIARY.—Of late years the auxiliary has become quite popular, and perhaps for all-round pleasure there is no better type of boat. It combines all the pleasure and excitement of sailing, with the uncertainty occasioned by calms, and head winds let out. As most boat owners are limited to certain hours for sailing, especially as no time of return home, the auxiliary will afford many days of pleasure free of worry, that otherwise could not be had.

Such a boat should have a good sail plan, with a motor of sufficient power to propel her without sails at from five to six miles. Almost any sailboat can be converted into an auxiliary; as, if necessary, the motor can be placed on either side of the centerboard, when there is not sufficient space or depth aft. The gasoline motor is certainly the ideal power for this type of boat, and in addition to power for propulsion, the motor can be used to run fans, lights, etc., and the same gasoline serves for a vapor cook stove. As these motors require no stack, condensers, or special tank fittings, etc., they can be installed very easily in old boats.

RAILROAD TRANSPORTATION.—In transporting launches by cars it will be found necessary to use a flat or gondola car, excepting for a very small boat, 15ft. or under. The launch should be securely fastened on a pair of good strong skids, forming a cradle, as this will greatly facilitate the loading and unloading, not to speak of cartage before or after the journey. The skids must be nailed and cleated to the bottom of the car, and a good tight cover of cloth or wood rigged over the whole. The rates for this class of freight are very high on all roads, it generally being rated at four times first-class. This is a point to be considered in purchasing at a distance. Boats of over 33ft. cannot be carried on a single car, nor can the height above the platform of the car be over 8ft.

Maryland Sportsmen's Exposition Association Tournament.

BALTIMORE, Md.—The tournament that was run here in connection with the Maryland Sportsmen's Exposition can hardly be classed a success, owing to the fact that after the fourth day it had virtually resolved itself into a local shoot. When the management discovered that most of the visiting shooters were going to leave for home, it refused longer to carry out the programme, and declared that the added money as advertised for Friday would be withdrawn. Much disgust was felt thereat by the few shooters who were still on hand. Much of the failure of this shoot can be attributed to the manner in which the programme was arranged. For an amateur shoot, the programme provided for too much shooting, and the events were also too lengthy. Then again the manner in which the money was divided was hardly such as to appeal to the average amateur. With the old inequitable percentage system in vogue, the average amateur stands but little show of lasting over two days. At the very longest, a shoot of this kind should not continue over three days; that is, if one desires it to be a success. It is well to bear in mind that few of this class of shooters can remain away from their business for more than three or four days. Furthermore, one can get but so much shooting out of a crowd, and then it is done. Of course the winners are willing to continue, but the method of dividing the money in use at this shoot always enriches the few at the expense of the many. Four moneys and 20-bird events is a proposition that will tempt only the expert amateur, as, in order to get into the money, he would virtually have to shoot an 85 per cent. gait, and there are few that can do this in competition.

Had the programme consisted of 15-target events, and the money been divided by the Rose system, it would have proven much more satisfactory.

It is well to keep in mind that but few shooters will shoot an entire week unless it is his business to do so. This business class was barred here. The manner in which the shooting was conducted when it was once in progress also robbed it of much of its pleasure, which precludes the possibility of classing it as sport.

The amount of labor involved made it much more like a hired man plowing, for it was one continuous round of shooting once you were called to the score. With so few shooters participating, it would have been much pleasanter to shoot all the events over one set of traps, instead of two, as was here the case.

This worked additional hardship on the shooter, as he no sooner finished his score on one set of traps when he was told to get twenty more shells to proceed to shoot the next event. This further added to the difficulty of making good scores, for as a rule only men of strong physique can stand such a strain. In this active manner five events were shot, after which an intermission for dinner was taken, following which the same procedure continued until everyone was shot out.

The management further erred when it permitted Sim Glover to participate on the first day as an amateur. This was rather inconsistent in view of the fact that at all other shoots where the line is drawn Glover has always been compelled to shoot in the professional class. This too created no little dissention, for through it Glover was permitted to win seventy odd dollars which should have found their way into the pockets of the amateurs. True, it was submitted to a vote of the shooters as to whether or not Mr. Glover should be allowed to shoot for the money. But one shooter, Dupont, had the courage of his convictions to vote No; but this vote was taken in Mr. Glover's presence, and had this not been the case, no doubt it would probably have been the other way. At night additional protests were entered, and the next day Mr. Glover was debarred from shooting for the money.

Mr. Glover, however, claims that he is not in the employment of any one, and does not receive any money for expenses, and that he also shoots his own money.

This classing of shooters bids fair to continue a vexed question.

Tourists.

Among the out-of-town shooters who were present are such well-known shooters as Wallace Miller and J. A. Jackson, Austin, Tex.; J. D. Gay, Pine Grove, Ky.; Col. Martin, Bluffton, S. C.; C. C. Nauman, San Francisco, Cal.; E. D. Hobb, New Market, Md.; Sim Glover, Rochester, N. Y.; the Mallory brothers, of Parkersburg, W. Va.; Pentz, Harpers, Ferry, Va.; Clay, Piedmont, W. Va.; Pearre, Fredricks City, Md.; John W. Coleman, Portland, Me.; F. W. Moffett, Bloomfield, N. J.; also Bob Emslie, the baseball umpire. The trade was represented by John Parker and Tom Keller of the Peters Cartridge and Kings Powder Co.; Jack Fanning, of the Gold Dust Powder; B. H. Norton, Hazard powder; and H. P. Collins, the local Du Pont powder representative.

The tournament was held at Prospect Park, and the arrangements for conducting the shoot were first class. Ample preparations had been made for handling a very large number of shooters, as there were four sets of target traps arranged on the Sergeant system, and two sets of King's live-bird traps in position.

Mr. Hawkins managed the target events, while Mr. Malone had charge of affairs when live-bird shooting was in progress. In the cashier's office Mr. J. K. Starr, of Philadelphia, held sway, and all these departments were well taken care of. The scoring was not always correct, as one of the scorers persisted in watching the shooting instead of paying strict attention to the work in hand. Thus it frequently occurred that he would score as he saw, in place as the referee announced.

This tournament was not conducted under the auspices of the Baltimore Shooting Association, and has no connection with the one announced by this organization for next week. However, the members of this Association contributed in every way possible to help make this shoot a success. Many of its members participated in the events, and endeavored in every way to continue the shooting as provided in the programme; this notwithstanding they were in no way interested. Very few shot through the day's target programme, but of those who did Fanning and Nauman were high; the former had an average of .938 and the latter .886.

First Day, Monday, April 17, Live Birds.

The programme consisted of four events, but as these were soon disposed of, several extras were also shot. The first event was 5 birds, \$5, high guns. This showed the following entries and scores: Col. Martin 5, Hicks, Norton, Gay, Hill, Coe, Dupont, Emslie and Malone 4, Collins and Leland 3, Glover 4.

No. 2 was 7, \$7, also high guns. This resulted: Hicks, Malone and Fox 7, Col. Martin and Hill 6, Dupont, Glover, Hobbs and Coe 5, Norton, Leland, Emslie and Dixon 4, Collins 3.

Then followed the 15-bird event, the entrance being \$15, class shooting. The division was 50, 30 and 20 per cent. The scores of this are given in full, and show, as is frequently the case, that second money paid better than first. The two straight men, Martin and Gay, got 50 per cent., or rather 25 per cent. each. While Smith, the only 14, got 30 per cent. There were two 13s. Thus only five of the fifteen contestants got a share of the purse.

An extra 10-bird event was shot. This showed nineteen entries, but not a single straight, though seven finished with but a single loss.

After this several miss-and-outs were shot. This first had eight entries, and Gay and Hicks cut up the purse on 6 kills each.

The next had but five entries and the debate ended when Hicks, Gay and Malone had each scored 7.

The last had a like number of entries, and here Gay and Hicks were again in evidence, as they were the only ones who could run up a total of 5.

Gay did the best shooting of the day, scoring 42 out of 45. All his shooting was from the 30yds. mark.

The weather conditions were fine, there being very little wind.

Event No. 4 was as follows:

Hill, 28	2222202122-9	S T Mallory, 27	0122222202-8
Smith, 29	2122220222-9	Collins, 26	2020112122-8
Gay, 30	2022222222-9	Glover, 29	0221210022-7
Linthicum, 28	1122022222-9	Mann, 27	0220021222-7
Coe, 29	1222022222-9	F E Mallory, 28	0022220221-7
Hicks, 30	1222022222-9	Dickson, 27	010220102-6
Fox, 30	111121022-9	Hood, 29	2002122200-6
Col Martin, 30	1221222200-8	Leland, 27	1001112000-5
Malone, 30	111011210-8	Norton, 26	2021002020-5
Dupont, 29	1011112210-8		

Second Day, Tuesday, April 18.

The attendance at the opening day of the tournament was about up to the average. The weather conditions were all that one could ask, being decidedly favorable to good shooting.

Fanning's shooting is worthy of special mention, as he put up the excellent percentage of 95. By scoring his first 59 straight he got off on the right foot, and readily realized how essential this is in making a good average. It naturally followed that in the face of such good shooting he should be at the head of the procession. However, his margin is not great, as Sim Glover,

who made his debut as an amateur here, is but one bird short of his total, while so far as shekels are concerned he has these to let, as he is some seventy odd dollars ahead for the day, while Fanning, who was shooting for targets only, got but the glory and the privilege of paying for his targets. Gay is third, a bird behind Glover. There is quite a little gap between Gay and Fox, a local man, who is fourth. There is average money to the extent of \$25, which is divided on a basis of 50, 30 and 20 per cent. This went to Glover, Gay and Fox in the order named, and netted them respectively \$12.50, \$7.50 and \$5. The old percentage system of dividing the purse is in vogue here, and as on several occasions first was won without a tie, it netted quite a nice sum, as the ratio was 40, 30, 20 and 10. Glover and Gay were the most fortunate ones in this respect.

The names of all the principals in to-day's shoot appear in the table appended in the order of merit. The programme consisted of ten 20-target events:

Events:	1	2	3	4	5	6	7	8	9	10	Shot at.	Broke.	Av.
Fanning	20	20	19	17	20	18	14	19	19	19	200	189	.950
Glover	18	19	19	20	17	20	19	20	18	19	200	189	.945
Gay	17	19	20	18	19	19	20	17	20	19	200	188	.940
Fox	18	19	20	18	16	16	19	16	17	20	200	179	.895
F E Mallory	18	19	17	17	18	16	19	17	19	18	200	178	.890
Nauman	12	18	19	19	19	17	16	16	19	16	200	171	.855
Lupus	12	18	17	16	16	19	18	17	18	19	200	170	.850

Jamison											20	10	.500
McKinney											80	38	.475

Third Day, Wednesday, April 19.

Owing to some vigorous protests, the management decided to bar Glover from participating for the money, though it generously offered to permit him to shoot all the targets he cared to free of charge. Whether the turning loose of this one wolf in the flock of lambs had the result of keeping away any of them to-day is hard to say, but nevertheless there is a perceptible shrinkage in the number of those who shot through the entire events.

Fanning is again high man to-day, with a single break less than yesterday, though to-day he is shooting from the 18yds. mark. Nauman, the young Californian, showed his speed to-day by capturing first average money, \$12.50, with an average of .925. Gay again got second, \$7.50, though his shooting really ranks second, as he is shooting from the same mark as Fanning. Malone, a home man, wins third average money, \$5, with .865. This is just a single break ahead of Fox, who was also on the 18yds. mark. But fifteen shot through the programme to-day, and two of these, Fanning and Norton, shot for birds only.

Under the division of 40, 30, 20 and 10, straights paid well, as there were never more than one in any event, with the exception of the last. The two lucky shooters were Nauman, with three straights to his credit, and Fox, with one. Fanning made two, but of course these netted him nothing. Gay, Martin and Hill all made straights in the last event.

Fine weather still prevails, and in this respect the management and principals have nothing to complain of.

Events:	1	2	3	4	5	6	7	8	9	10	Shot at.	Broke.	Av.
Fanning, 18	18	19	20	19	20	18	19	19	18	19	200	189	.945
Nauman	19	18	20	19	19	19	20	20	18		200	185	.925
Gay, 18	19	19	17	19	18	19	18	19	16	20	200	184	.920
Malone	17	17	15	19	18	18	18	18	17	16	200	173	.865

Pearre	11										80	45	.562
Pentz											100	51	.510
Gardner											20	10	.500

Fourth Day, Thursday, April 20.

That Fanning outclasses all the other shooters here is evident from the fact that he has remained at the top from the start. His percentage is not so good as on the two preceding days, though .920 will always rank well to the top in any company. Nauman to-day is on the 18yds. mark, though this did not prevent him from capturing first average, but it reduced his percentage somewhat. Dupont (Ducker), one of the home contingent, came to the front to-day and stopped but one bird short of Nauman. Jackson and E. T. Mallory took third average money on .860. The Mallory brothers shot a very even race, just one bird separating them at the close. Malone, at 18yds., found it more difficult to negotiate the targets. Really the best performance of the day was that of young Fox.

Unfortunately he could only participate in seven of the events, but in these he showed the best form of all the contestants, as he has an average of .935.

From indications it looks very much as though there will be little shooting to-morrow, as most of the visiting shooters are talking of going home. Gay was called home on a telegram, while Miller and Jackson, and the Mallory brothers speak of going also. With this reduction in numbers there will be but few left. Under these circumstances it would not surprise me if the management would declare the shooting off.

Events:	1	2	3	4	5	6	7	8	9	10	Shot at.	Broke.	Av.
Fanning, 18	18	20	19	17	18	19	18	19	18	18	200	184	.920
Nauman, 18	18	17	19	16	17	17	18	18	19	17	200	176	.880

St. Louis Shooting Association.

Mr. GEO. MUNSON, of St. Louis, sends us the following concerning the forthcoming tournament of the St. Louis Shooting Association:

Everything is hustle and bustle at Du Pont Shooting Park, in St. Louis, these days, as Superintendent J. A. Corray has a big gang of men at work preparing the grounds, erecting a new club house and placing new traps, so that everything will be in tiptop shape when the shooters arrive to compete in the twenty-second annual shoot of the Missouri State Game and Fish Protective Association, which will be held May 15 to May 20 under the auspices of the St. Louis Shooting Association.

On Saturday, May 13, Mr. Rolla Heikes, of Dayton, O., and Mr. J. E. Riley, of Kansas City, will shoot a match at 100 live birds at Du Pont Park. The amount of the side bet has not been decided on as yet, but it will not be less than \$100 or more than \$250, the loser to pay for the birds. Mr. Heikes, is one of the best-known sportsmen in the country, and is regarded as one of the best shots in the land. Mr. Riley is an old resident of Kansas City, and has been for years considered one of the best shots in the live-bird shoots in the West. Without any practice, Mr. Riley defeated a field of forty-five for the Kansas City Star championship cup in 1896. J. A. R. Elliott, immediately challenged Mr. Riley for the cup and defeated him. Mr. Riley was vice-president of the Missouri State Game and Fish Protective Association in 1886, and has been an ardent admirer of the rod and gun ever since. Mr. Heikes has defeated a great many men who have said more about their shooting ability than Mr. Riley, but he says he has never entertained a harder shooter than this man from Kansas City.

This match between Messrs. Heikes and Riley will inaugurate the new live-bird traps that are being placed in position at Du Pont Park. These traps will be a decided novelty to every sportsman who attends the May tournament. They are the invention of Mr. E. D. Fulford, of Utica, N. Y., who is not only a first-class man with the shotgun, but also a skilled mechanic. These traps are made of very heavy steel. The pigeons are put in from an underneath trap, the trapper boys and pigeons being in a pit 6ft. deep and 60ft. long. The operation of each trap is controlled by a lever, the slightest movement of which opens the trap, making it lie perfectly flat on the ground and leaves the pigeon exposed to view in an instant. The noise of the traps scares the pigeon, and he, seeing daylight all around him, takes wing immediately.

Pigeons that would be slow flyers in ordinary traps are fast birds when trapped by this new system. It approaches as nearly as possible to the flight of a bird in the field upon which the hunter has come unexpectedly, and while perfectly fair to the shooter, is also fair to the bird.

The improvement in ammunition and guns has been so great in the past ten years that high scores have become possible to a great many amateur shooters. Trap-shooting clubs throughout the country have recognized this fact and have handicapped the shooter by placing him at a greater distance from the bird than was formerly the practice. In former years 28yds. was considered a proper distance for an expert shooter, but nowadays 30yds. is the place where most experts stand, and some are placed as far back as 32yds. This does not seem like much of a handicap, but as it makes the pattern of the load very much larger, so that the bird may escape through it and it lessens the penetration of the shot. A bird may be hit with seven or eight pellets of shot and still have strength enough to fly over the boundary line, whereas if the shooter had been closer to him the shot would have gone clear through the bird, and would of course have stopped his flight immediately.

Mr. W. V. Reiger, who has been engaged to officiate as referee at the May shoot has been official referee of the Missouri State Game and Fish Protective Association for a number of years. Mr. Reiger is quite a modest man, with a clear eye and a correctness of decision of which few can equal. His decisions are never questioned, and this insures to the Association that the live-bird contests, as well as the target programme, will be conducted in a perfect manner.

Mr. J. J. Hallowell, of Phoenix, Ariz., has accepted the position of manager of the May tournament. Mr. Hallowell does not need an introduction to many shooters of the country, as he has traveled extensively all over the United States, shooting his way to the front at all times. Mr. Hallowell learned to shoot off the back of a bucking broncho on the plains of Arizona, and probably has few equals as an off-hand revolver marksman in the land. He is a typical Westerner in appearance, being almost a giant in size, and has the physical ability as well as the nerve to make his ruling stick as manager of the coming shoot, should there be any occasion for such treatment.

Centerdale Gun Club.

CENTERDALE, R. I., April 15.—Our second medal shoot brought good weather and a good crowd to-day. Everybody was pleased at the handicapping, as the scores were all very even. A three-cornered match had been arranged between Root, Bain and Reiner, but at the last moment Griffith was taken in, and he won out, with Reiner second. It was a fine day to shoot, and some of the boys who do not generally shoot very well did excellent work. Our traps worked fine to-day, as we have overcome previous hitches. Below are all the scores:

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6
Targets:	10	10	10	10	25	10	Targets:	10	10	10	10	25	10

Reiner	21 22 22—65

Sherbrooke Gun Club.

SHERBROOKE, P. Q., April 19.—The Sherbrooke Club has come out of its winter shell and started practice in earnest, preparatory for the prospective series of matches and tournaments. Shooting has been going on for two months in a spattering way, with an attendance of anywhere from two to six. But now Joe and his gang has quit exercising Widow Green's fox and settled down to business, and last Saturday there was a fairly representative turnout. Five hundred targets were thrown in the course of two hours and a half, and enough of them broken to show that as soon as the boys get limbered up a little they will be in condition to challenge Montreal for that League cup. A match is on between Craig, the present holder of the Provincial championship cup, and Goodhue, though the date is not arranged yet. The main event ahead of us is our grand annual, on July 1, Dominion Day, open to all amateurs, and we are going to try to break our record this year.

We hope to see all the old faces, and many new ones on that day, and will do our best to make it pleasant for them. The boys are going to Westmount's shoot on May 24, and several of them to Bellows Falls in June, to the Interstate, and anywhere else within a reasonable distance, where a shoot takes place between now and July 1, and their business will be to shoot and whoop up our "annual." C. H. Foss.

Washington Heights Gun Club.

NEW YORK, April 19.—The scores of the Washington Heights Gun Club made at their new shooting grounds, at Fred Lohbawers, Trogg's Neck, Westchester, on Tuesday, April 18, were as follows:

H Forester, 23	2222222212—10	F Mehler, 28	0020002000—2
R Romer, 27	002022*101—4	E Steffens, 28	12001*1111—7

ON LONG ISLAND.

Sheepshead Bay Rod and Gun Club.

Sheepshead Bay, L. I., April 20.—Twenty-two shooters faced the trap at the Sheepshead Bay Rod and Gun Club's shoot, all of whom were confident of carrying off the honors of the day. The first 12 birds met the ground, but the 13th man, Col. Geo. Tappen, started the goose egg rolling until there were but two men left with clean scores, killing their 7 straight. In the shoot-off Mr. McKane killed a difficult right-quarter bird, which made his opponent slightly nervous, causing him to miss his 10th bird. Those who shot 12-gauge guns stood at 23yds.; 10-gauge, 27yds. Mr. Ira McKane won the shoot-off and the badge.

Brooklyn Gun Club.

Brooklyn, L. I., April 24.—On Saturday last we had a rattling good shoot; sixteen shooters tried for the prizes. Event No. 4 (handicap misses as kills) and 7 are prize events, the prizes being 100 loaded shells. Nos. 5 and 6 were ties.

The first prize was won by W. J. Lane, he having to shoot off three times for it. The second was won by E. Brinton, of Philadelphia:

New Utrecht Gun Club.

Woodlawn, L. I., April 22.—Members of the New Utrecht Gun Club turned out in force this day to take part in the last pigeon shoot at Woodlawn. Twenty-five merchandise prizes were distributed among the members winning in the different events.

Events Nos. 1 and 2 were miss-and-outs, with one prize in each event. No. 3 was 3 birds, then miss-and-out, with three prizes. Event No. 4, same, with five prizes. Events Nos. 5 and 6, same, with seven prizes in each.

In event No. 3 F. A. Thompson, Hegeman and Gaughen had a hot race, Gaughen finally dropping out on a strong quartering driver in the 18th round. In event No. 5 O'Brien and Horn had to shoot off for seventh prize, as they both dropped their birds on the 9th round, O'Brien winning.

Louis Piercy shot along as guest. The club will secure new quarters and resume pigeon shooting in September. Scores of the day given below:

J. W. BABBITT.

After the M. W. & Co. handicap contest on April 21, at Watson's Park, Burnside, Ill., Mr. Silas Palmer shot with an extraordinary degree of skill in the miss-and-outs and practice shoots, killing 60 live birds out of 61, and making a straight run of 63.

Brockton Gun Club.

BROCKTON, Mass., April 19.—The first shoot of the season was well attended. The squally wind played jinks with the targets, allowing but one straight score, although several ran to 9 o. k. Then, well never mind! the older ones will do better. It seemed too bad for beginners to face such hard conditions, yet eight tried to shy shot to break the very deceptive targets, and all of them say they can do better next time:

Events:	1	2	3	4	5	6	7	8	9
H S Wood	4	7	9	6	6	6	8	7	9

I used to fancy that everybody would like clouds and rocks as well as I did, if once told to look at them; whereas, after fifty years of trial, I find that is not so.

John Ruskin.

PRESERVE THE NEARBY WATERS.

MR. WM. H. AVIS, whose pleasant story of angling in nearby streams was told in last week's issue, writes that he manages to find some trout every spring, for while the brooks do not yield so abundantly as they used to, a supply giving fair returns is maintained by constant and systematic restocking. This success in what may be termed the rational exploiting of small streams near a great city illustrates what is perfectly practicable with very many streams throughout the country. At an expense of time and money and trouble so slight as almost to count for nothing, waters near home by restocking with yearlings annually might be kept in a condition to afford a constant supply for moderate desires.

The usual rule has been in operation so long, to take with never a thought of replacing, that hundreds and thousands of streams have been ruined, when, by a wiser policy the fishing in them might have been preserved for all time. There are numerous conditions, such as the clearing of forests, the draining of swamps, and other destruction of water supply and of cover, which inevitably involve the ruin of the fishing. But in quite as many and perhaps in more cases the conditions are such that the passing of the fish is caused by unreasoning, improvident and therefore foolish overfishing. As we have often pointed out, the angler of limited means, or who is closely confined to his work with stinted leisure at the best, is the one who is most directly interested in caring for the near home waters, where he may find opportunity for his recreation without large expenditure of cash for railroad fares and hotel bills and guide and boat hire, and of time in traveling to distant water regions.

In the claims of the local fisherman also is frequently found a quite sufficient justification for the trespass sign, which the angler coming from afar finds confronting him on coveted territory. The warning notice means simply, "No fishing here for you. It is for us." We are accustomed to hear frequent and very natural denunciations of this no-fishing sign, and to have expression of the feeling of chagrin and resentment engendered by it in the heart of the man who is on the outside and looking in; but of course there is another aspect, that which is presented to one who looks at the sign from the back of it, the man who is in and looking out.

A HOME ANIMAL.

IF it is not so long ago that you have forgotten all about it—although indeed the further back it is in the years the more vividly it is recalled, as if happening yesterday—you may remember how when as a youngster you caught your first fish in the creek or the pond, the immediate impulse was to rush home with it to show it to your mother. This trait, manifested in the youngest fisherman of us all, is one which persists through life. It is as natural for the angler or the sportsman to take his fish and game to his home as it is for the eagle to fly with its prey to its eyrie.

The sportsman is a home animal. He lives in a home, goes afield from a home, returns to a home. Home he brings his report of success or failure; home he brings his trophies or would bring them if he could; and at home he finds the gratulation which doubles the day's winnings, or the sympathetic word which dulls the edge of chagrin.

This aspect of the sportsman in his home relations is one of which we read little in print; but it is existent always and is an ever potent element of our lives as sportsmen. Some of our most pleasant and dearest recollections of the days afield have to do with the home coming—the elation with which the creel of trout was given over for the inspection of loving eyes, the quiet satisfaction and exultation with which we saw revealed at length the "big one" purposely put in first that it might come out last and so give climax to the exclamations of delight with which the home folks received the trophies of the day.

Moreover, the sportsman, if we may believe half the good things we hear about him, is a fellow of generous impulse; and one of the chief elements of the gratification

he finds in his outings is the sharing of his fish and his game with others, perhaps those of one's family circle, or some fishing friend unable to get away, or some sick one whose fickle appetite is tempted with fish or bird.

For many reasons, and for very good reasons, too, we like the privilege of taking our game and fish home with us; and for these same reasons we resent the laws which absolutely forbid transportation. Such statutes effectually cut off a very considerable factor in the composite elements which make our outings so pleasurable.

The purpose of non-transport laws is most commendable. They are designed to prevent the killing of game for market, and when enforced by an honest and vigorous administration are very efficacious in fulfilling this purpose. They are among the most useful and effective laws we have, and an universal adoption of them would go far toward solving the problem of game and fish protection.

But it has been found perfectly practicable to frame and administer these laws in such a way as to cut off the shipment of game to market, and yet to permit the individual owner of game killed by him to take it home in certain limited prescribed amounts.

ANCIENT HUNTING KNIVES.

THE two figures of primitive hunting knives on another page represent two common types of those once in use among the Indians. The one of stone is shaped, as will be seen, somewhat like a spear head, but has a cutting edge, strong and keen enough to work its way slowly through a buffalo's hide and easily to sever the flesh. It is one of the old stone knives, lost perhaps a century or two ago during the butchering of the buffalo in an Indian slaughter pen, covered up by dust and dirt, and only unearthed in recent days by one who was exploring the curious antiquities of this ancient killing ground. When in use, the knife was fitted with a wooden handle, lashed to the blade with strings of green rawhide, as shown in the illustration, but the snows and the rains of many winters and summers had destroyed all this perishable material long before the knife was found again.

The bone knife was equally useful. We may imagine it to have been especially efficient in the operations of skinning and of dividing the meat, though of course it was much more perishable than one of stone. On the other hand, it took a smooth edge, which could easily be renewed by whetting it on a smooth stone. As already remarked, the first metal knives acquired by the Indians consisted of these bone implements with a strip of tin or hoop iron inlaid along the edge.

From the knife of stone or bone to that of the toughest keenest steel is not a long step. The implement is the same, its uses are the same, only the material is different. We can imagine, however, the time and labor that must have been required—judged by our standard—to skin and cut up a large animal with one of these early knives.

SNAP SHOTS.

Toledo, Ohio, is planning for a centennial exposition in 1902 or 1903, and the projectors of the enterprise have shown praiseworthy sagacity in making Mr. John E. Gunckel the president of the commission for carrying out the scheme. Mr. Gunckel is widely known as an always enthusiastic if not always truthful fisherman, and it was quite a matter of course that one who combines angling and business so systematically as he does should look to his fishing for an inspiration in devising novelties for the great show. President Gunckel proposes to have an attractive fish exhibit, and to install it in a building planned in semblance of a monster fish. Local preference is that the construction shall in its lines follow those of the black bass, the favorite fish affected by Toledo anglers; but Mr. Gunckel tells us that there is a distinct demand from Massachusetts for the whale or at least the codfish, while California is contentious for the leaping tuna, Florida has put in its plea for the tarpon, and New York salt water fishermen have suggested the sea robin; there is a well defined demand from Danvers, Vermont, for the mudfish; and the anglers of Little Rock, Arkansas, through their spokesman, Jno. M. Rose, Esq., insist upon the Mississippi shovel-nose catfish. Perhaps a gigantic, monstrous and hitherto unheard-of and un-

dreamt-of fish freak embodying the picturesque characteristics of all these several species may be adopted by Mr. Gunckel as an expedient to allay sectional jealousies, preserve his own popularity and assure the triumphant success of the fishery features of the centennial.

Deputy Controller Gilman has displayed his customary pernicious activity this year, invading the rooms of the Legislative committees and endeavoring to put through his pet measure to permit the sale of game in close season in New York City. The measure this year was fathered by Mr. Mazet, and as last year had the personal support of Senator T. C. Platt. In vigorous and alert opposition was Assemblyman H. M. Sage, to whose activity and vigilance the final defeat of the bill was largely due.

This Mazet cold storage bill would have practically opened the New York markets to game throughout the year, and so by putting a premium on illegal killing in New York and in neighboring States, would have done great harm. The bill passed the Assembly with flying colors, but that fortunately was the last heard of it, for it was "put into cold storage" by the Senate Committee. Even if that body had acted favorably on it, however, the danger of its becoming a law would have been small, for it would undoubtedly either have received the Executive disapproval or would have been allowed to die without action. The State of New York is fortunate at present in having a Governor who is not only deeply interested in all matters of game fish and forest preservation, but also has so clear an acquaintance with these subjects that he can always be depended upon to act on them for the public good. This he will of the matter in h cate points, about sufficiently familiar self expert adviser questions at issue. It requires a long memory to recall a Governor of New York who has taken any active and intelligent interest in these subjects. Governor Roosevelt, being himself a thorough sportsman, does feel a deep interest in them. Moreover, he possesses one quality which above all others has endeared him to the American people, and that is courage. It is a satisfaction and a security to the sportsmen of the State—and of every State which is interested in having the New York game market restricted—to know that in Governor Roosevelt they have a champion who will stand intelligently and firmly against any endeavor by open or covert legislation to relax the legal safeguards now existing for the game and fish.

Kansas is prolific of notions and projects, and is forever giving the rest of the world something to think about. The latest creation is an artificial lake in the Cheyenne Bottoms. It all comes of a cloud-burst which filled a great natural depression fourteen miles long and from three to four miles wide with water to the depth of seven feet. And when the waters were abroad upon the earth and the flood covered the land, it set the Kansas folks to thinking; and as they stood on the shore and looked across the waters they reflected that the bottoms must have been the bed of an ancient lake, and then they thought of a way to bring a permanent water supply by a thirteen-mile ditch from the Arkansas River; and there you have it, a genuine lake in Kansas, such as has not existed in the State before since the days when the mastodon roamed the prairies, long, long before Kansas bled. It is something the untraveled resident has never seen in all his life. A summer resort is to be created, with launches and sailing craft; and what is more—and of course most important of all—there will be a new ducking ground if the wildfowl shall appreciate it and tarry, as they are expected to do.

The membership of the League of American Wheelmen continues to decline at a rate which is alarming the friends of the organization. As we have suggested before, one alienating agency is the weekly consignment of silly puns which is sent to the members in the L. A. W. Bulletin. These off-puttings of a diseased mind at the rate of a thousand or more a year weary and disgust sane people; and numberless lapses from membership may be attributed to this one cause. As it is an evil for which simple and summary remedy may be found, the officers of the League should give it attention.

The Sportsman Tourist.

Types of Sportsmen.—I.

SOMEWHERE Shakespeare says that

"All the world's a stage
And all the men and women merely players;
They have their exits and their entrances,
And one man in his time plays many parts."

Billy the Bard goes on and refers to the schoolboy and his unwillingness to attend school. Not knowing when a boy begins to be a man, or when a man ceases to be a boy, we are constrained to consider the schoolboy as a sportsman. A little one, if you like, an amateur, but often proficient.

We locate our specimen in a New England village, his first gun being an old-fashioned Enfield rifle, cut off and bored out for a shotgun. He obtained it from the proceeds of the sales of scrap iron to the village blacksmith, driving cows to pasture, gathering cider apples, etc. Possibly some of the iron was sold twice and the blacksmith didn't know and the railroad company didn't care. His mother felt alarmed at the purchase. His father said: "He may as well have it. If the gun does not kick him the horses will, or possibly he may fall off the barn roof."

Who can describe the joy he felt, or tell how he longed to hear the gun speak? He poured in a handful of blasting powder, and then followed wad after wad of newspaper; then the shot, and as the iron ramrod clanked in the barrel the last time, and the cap was on, his spirits were high, and there was a fair prospect that his spirit would go higher. Chipmunks were wont to sport on the wall adjacent to the barn. One posed for him in the altogether as a matter of convenience. There was a terrible explosion. The horses plunged and whickered in the barn; the would-be setting hen, tied to a stake by the leg with a strap of selvaige to curb her maternal desires, burst her bonds, and the mass of fuss and feathers sailed over the barnyard fence, cackling in fright, and the anchor rope trailing like the tail of a kite.

What became of the boy, the gun, and the squirrel? Oh! the boy went to grass, the gun went over his head into the watering trough, and the squirrel was dead, every little bit of him. The boy's mother helped him into the house, unbuttoned his calico shirt and rubbed his shoulder with balm of Gilead and opodeldoc, and then gave him half a pie as a counter-irritant, and he slept off the effects of all in half an hour and wanted more. He used the gun right along after that with more or less success. He studied loads, although of itself the gun was sufficient for the little fellow.

He cleaned the gun in the kitchen one day, and then his mother cleaned the kitchen. He drove a pine plug in the nipple and then poured hot water into the barrel. It stood against the table, while he fitted a rag around the stick. The stick stuck fast and then slipped too easy; then the black vomit invaded this peaceful home. The ceiling, the floor, the mother and son were besmirched with the black decoction of saltpeter, sulphur and charcoal. The plug flew out and a stream of the dirty paste hit the cat in the eye and the pet immediately threw a fit. The boy and the shot or squirt gun were fired to the woodshed.

Many bullets lodged in the trees and fences and buildings about the place, and he would have done more in that line if his supply of lead had not run short. The tea-leads that his sisters used to crimp their hair with and a pewter tea-pot had disappeared. Where the sink spout left the house wall there was a black streak on the clapboards, and he was admonished to go no further in that direction.

As a boy he caught his share in trapping muskrats and woodchucks, snaring rabbits and partridges, fishing for horn pouts, perch and bream; when not fishing, shooting or sleeping he was playing ball known as barn tick and four old cat, or roaming the fields and orchards for fruit that did not grow on his father's land.

It may not be amiss to some sportsmen to state a little experience that is coeval to their progress. Some good neighbor gave his father samples of home-made wine, and inasmuch as the boy was a member of the Band of Hope and had his curiosity aroused by the oft repeated "Look not upon the wine when it is red," he sampled it, and knowing that "one swallow did not make a summer" he took several, and what he had sent to his stomach went to his head. His mother observed his wild-eyed appearance, and the more she looked at him the worse he became. He went to bed in the middle of the day, the furniture played tag all around the room with him and he was "it" all the time. The wild roses creeping around his window were like the sparks of his Fourth of July pin-wheel, but he got over it and lived to grow up and lecture upon temperance.

"Men must work and women must weep." One day he packed his little trunk, boarded the cars and went away to a neighboring city to learn a trade. His mother's tears were his amulet of safety and his remembrance of her love and kindly care were his guide in the right path in after years, and he could not well wander far before his thoughts were back to her and to duty. In succeeding years he returned to his home on Thanksgiving Day, and the associations became more valued to him with each visit; but time brought changes. A sister is sleeping the long sleep; age has its claims, and a summons answered leaves him with but one parent; a brother goes to the far West; another marries; then a sister finds a new protector; the homestead is sold and no more can they call it "home." Many long years elapsed, until one bright autumn day a man, impelled by a longing nursed by time and remembrance, drops the bars at the pasture entrance and recalls the time when leaping over them was easy. As he passes under the walnut trees he, in the absence of other friends, tells his pointer that yonder buildings sheltered him in the years gone by. As though his dumb companion could understand, he talked on of the past. Who knows but what the dog did understand? Do those soft eyes speak not, is the placing of those paws upon his cartridge belt meaningless? The changes about the place were slight. The pump

is new, and as the gun rests against the wall the hunter drinks deeply and knows that the purity of the water is unchanged. A tap on the kitchen door is answered by a white-haired old lady. After explaining that formerly he need not knock and that he had free access to all, the good New England woman said: "So you are one of the — boys." She took him over the house, into the sleeping room where he quarreled with his brother one cold winter night and was bundled out of bed and on to the chilly floor in defeat. He went into the sitting room where winter evenings he had popped corn and eaten apples and nuts, while his mother knit the blue woolen socks for her boys and his father read the weekly agricultural paper. The nails where hung the Christmas stockings a generation ago were still in place, and he fancied that the array of little copper-toed boots were still behind the stove. The barn was the same, the same horse stalls, cow stanchions and hay mows. The kindly old gentleman said to his good wife: "Mother, it seems like as if our boy had come home at last." Tears welled from the dear old lady's eyes as she thought of her boy sleeping somewhere in a soldier's unmarked grave under the Southern skies.

With one last look back at his old home, he entered the pines beyond the orchard, and coming to the cemetery the names of old schoolmates are seen upon the marble slabs. He passes the sepulchres of granite where repose whole families, and recalled the evening that he groaned in the shade of the hedge while his accomplice recited to the timid children, "Hark, from the tombs a doleful sound." He strolls by chain-enclosed plots where granite posts support the chains and bell-like pendants are suspended as ornaments. He inverts the bells and finds that the wasps and hornets build their mud homes as of yore. He finds the resting place of one to whom more than to others his thoughts have reverted. She was his favorite among the schoolgirls; hers were the little feet that he had often bound the skates on; her lithe form was beside him at the straw-rides and at the post-office when the mail came in. Upon no other double sled than his would she coast. Her love and loyalty were always remembered, and as he placed his gathering of wild flowers above her that day his tears went with them. Let the birds sing above and the pine needles cover her, her voice is still heard and her smile seen, though his home is in a far distant city.

W. W. HASTINGS.

Kootcheraw and Pemmican.

Editor *Forest and Stream*:

Capt. Kelly's mention in a recent issue of your journal of the old-time pemmican, its manufacture, and its value as an economical ration for the prairie ranger of the mid-century period, recalls to my mind another article of provender almost equally nutritious and compact, yclept "kootcheraw," which was the aboriginal vernacular for a composition of parched corn pulverized in a coffee-mill or ground between two stones, Mexican fashion, and an almost equal quantity of sugar. Maple sugar or West India sugar, either one was used, according to the locality of the manufacture, which was chiefly along the eastern border of Kansas and Missouri, where corn was a product and rock maples indigenous. The modern corn balls of the confectioners are germane, but an inch cube of the old-time kootcheraw would go as far as a hundred corn balls in the matter of sustenance and distention of the stomach. And it was quite as palatable, forming a pleasant dessert after a meal of pemmican. Only a morsel of it could be eaten at a time, not half a pint in a day, and a man could travel hundreds of miles on what he could carry in his "possible kit" or haversack. The difficulty in putting it always to practical use was the inordinate quantity of fluid required to wash it down; and any person attempting to eat kootcheraw without plenty of water was in the predicament of the contestants in the soda-cracker match, who undertook to eat ten crackers without drinking; entrance fee, 50 cents; capital prize, \$10. They never won! On the grand prairies in midsummer, after the "wet weather creeks" ran dry, a very fair lubricator was contrived from the juice expressed from mascerated cactus, a species of which yields a beverage which that old Santa Fe trader, Max Greene, described as "the intermediate of some wine and first-class swill."

If pemmican is to be recommended for our troops and frontier travelers, why not kootcheraw as well? For my own part, having subsisted on both in my journeys across the plains when adolescent, I would decidedly favor their manufacture and use now. The commissary would certainly find sensible relief from the burdens and requirements of present-day transportation, while heavy marching orders would not carry with them the portent of hardship for our soldiers which they now do.

Any superannuated army officer or soldier who was on active duty before the Union Pacific Railroad crossed the plains, and any old freighter who plodded the Santa Fe Trail while the trade was on, will indorse Capt. Kelly. I know, and accept my added testimony. If I remember right, something is said on this subject in an article entitled "The Siege of Fort Atkinson," which I contributed to the October issue of Harper's Magazine in 1857, describing a wagon trip across the plains.

As for pemmican, which was always a staple article of food so long as buffalo were running, it was packed in portable sacks of fifty to a hundred pounds' weight, with the four corners projecting for convenience in lifting and handling. The last shipment of pemmican in quantity and bulk which I ever saw was at Regina, N. W. T., in 1882, when it was a canvas town, and the Canadian Pacific Railroad had just pushed through to that point. A string of Red River carts had come down to the station from the South Saskatchewan, to which point the remnant of the buffalo herds fled, after the terrible slaughter the previous winter on the Yellowstone bottom. This consignment of pemmican was like the last handful of meal in the barrel, when famine was on; and the contemplation was sad to a sentimentalist who realized that the great bovine race of the plains had perished, and was wiped out forever. At that time I exchanged my very good pony bridle for a shaggy halter, traded even, to the contempt of the hirsute plainsmen who witnessed the swap, and

the halter is now in the museum of the Long Island Historical Society in Brooklyn.

CHARLES HALLOCK.

Gens des Bois.—III.

Ben Jourdan.

"OLD Ben Jourdan is a noble son of the forest—a man you can't measure by dollars and cents," said Mr. W. R. Woodbridge, of Port Henry, N. Y. "I have camped with him since '64 and know something of the man." This is the truth concisely stated about Jourdan, or Jerdan, as he is called in his Adirondack home. He is not to be measured by the standard applied to most men nowadays, when the very alphabet seems based on the \$ and cts. symbols and little is said or written without the use of these characters; and it is as a man who has escaped the stamp of the market place and has no ambition to get ahead in the world that Jourdan deserves consideration.

Jourdan has accomplished absolutely nothing in his three score and ten years, and to-day he is doing chores for a farmer in return for his board.

It is safe to say, however, that on the side of character his life has made more of an impress on the personality of those who have known him than the great majority of the self-seeking elbowers they meet every day of their lives.

Jourdan was born seventy years ago in the town of Moriah, which is one of the largest as well as one of the roughest, topographically speaking, in the State. His father was shiftless, according to most standards, and particularly so in the days when the sweeping characterization was made of all hunters that they were men too lazy to work and not smart enough to steal. His honesty, however, was never questioned, and he lived up to his standards of right and wrong as he saw them. When he needed money he would take a job of shaving shingles, but soon becoming tired of this, he would go off hunting or fishing, as the case might be, following the Bible precept of taking no heed for the morrow. And yet he lived and reared a family, and probably enjoyed his life a great deal more than city dwellers who feel guilty pangs for chance momentary recreations snatched from the busy days.

Ben Jourdan was the eldest of three boys, who were all born woodsmen, and later developed into good guides. His brothers, Orlando and Napoleon Bonaparte, called Don and Bony for short, have since died. As guides they were almost as well known as Ben. No one of them could be made a commercial guide. They would not go with some men for any price, while they were accustomed to guide others they liked for very small compensation at times.

Ben began guiding as a boy of fifteen, and has carried a pack basket for fifty years. He traveled west into the wilder sections of the Adirondacks and camped on Clear Pond, Elk Lake and the Boreas. Sometimes his wanderings carried him as far as Preston Ponds and Cold River, but his favorite territory was the watershed at the headwaters of the Hudson, in Essex county. In the cold weather Ben hunted and trapped, and in summer he fished and guided. Certain qualities which he possessed made him early in life much sought after as a guide.

Ben in Camp.

Ben was good-natured and jolly about camp, and he was always ready to impart to anyone the knowledge he possessed. The present Representative from the Congressional district where Ben lives tells of his patience in teaching him as a twelve-year-old boy some of the rudiments of woodcraft. "Mind you notice that tree," Ben would say, as they traveled some woods trail, "We will come back this way, and I want you to stop and tell me when we come to that tree." At times he would show the boy how to make birch bark cups that would hold water without leaking a single drop, and instruct him in the art of building a fire or getting his bearings in the woods.

Ben is a good cook, and it is this fact that most impressed itself on the boniface of the Stickney House when he had him for a guide. He remembers perfectly how the trout tasted which Ben cooked years ago at Preston Ponds, though the circumstances of their capture long since faded from memory.

As a fiddler he is an important factor at country dances. He also sings in falsetto, a style that used to be common enough in the North Woods, but which at the present time has almost passed away. His songs are chiefly of the ballad type, and are characterized by a somewhat monotonous refrain and an unlimited number of verses. One of them, entitled "Brave Wolf," has for its theme the assault on Quebec, and another tells in mournful strain of a soldier who learns that his child is dying, and on being refused a furlough deserts, with the ultimate result of being captured and meeting the deserter's fate.

How Ben was Lost.

Ben has all the natural aptitude of the woodsman for finding his way in the wilderness, but even the best man at times makes mistakes. Mr. Woodbridge tells of an occasion when Ben was at fault. He was guiding a party on a trip to Mt. Marcy from the Boreas Ponds. It was drizzling rain and familiar landmarks were blotted out by sodden clouds. Members of the party who were provided with compasses tried to perplex Ben, telling him he was traveling in the wrong direction, but nothing they could say bothered him, and he kept along in the same course as before.

"I've got a better compass than any of you," he said at length. "See that hemlock tree? Well, the top twig of that tree points due east."

The men who had compasses looked at them and found that the statement was true.

"What do you do, Ben, when you get to a place where there aren't any hemlocks?" one of them asked.

"Oh, I use something else for a compass," said Ben, "same way that you take a lead pencil to write with if you can't find a pen, or a burnt stick, or the bullet of a rifle cartridge. There's more ways of killing a dog than choking him to death on fresh butter."

"Do you judge by the side of the tree the moss grows on?" said the questioner.

"Not always," replied Ben. "Depends on the tree and the place where the tree grows and a whole lot of other things. It's all experience. There's no rule that works all the time."

The party reached the summit of Marcy safely and camped that night in Panther Gorge. On the return trip Charlie Judd took a notion to cross through Railroad Notch to Elk Lake and then out to Fenton's, on the main road, where he could take the stage for home.

Two hours after he left the party a shout was heard. Ben said it was Judd calling for assistance and that he was lost. He answered the shout, which came from a direction at right angles to the course they had been pursuing, and advanced to meet the lost man. In five minutes they had found him. Judd acknowledged that he had traveled in a circle and was hopelessly mixed up, and he was thankful to get back to the party.

Ben naturally laughed at him for being lost, and after he had meekly taken his medicine the party set out again for the camp on Boreas.

They traveled fifteen minutes or more, and then Congressman Foote, who had a compass, chanced to look at it and made the startling discovery that they were going in a direction that made camp 24,000 miles away.

"Hold on there, Ben," he called out. "What way are you heading?"

"West," said Ben; "I'm going to camp fast as I can to get in out of this rain."

"No you're not," said Foote; "you're heading east. Your ready-made compass has fooled you this time."

Ben looked at the instrument in Foote's hand, which happened to have a plain needle without a cross-piece, and coolly said that the dark end pointed south and that he was right. Another compass was produced and it was found that this, too, had no cross-piece. The individual members of the party had so much confidence in Ben that they were completely at sea, and could not be positive whether it was the light or the dark end of the needle that followed the Pole star. Finally someone asked Ben if he would go by the moss on the trees. He assented to this, and after a few minutes' observation acknowledged that something was wrong.

As the quickest way of solving the tangle, Ben took the party on the back trail to the place where they had been joined by the lost man. Here it was perfectly evident that he had been turned, and in the excitement of the moment lost his bearings. Ben acknowledged his error, and had no difficulty after that in conducting the party safely to camp. This was the first and last time Ben was ever known to be lost. Thinking he would be sensitive on the subject the members of the party determined not to say anything about the incident. A few days later, however, when they had gotten out to Nelson Labrier's, at Boreas River, Ben said to Mr. Woodbridge:

"I've just been telling Nelson about my experience."

"What experience?"

"Why, my getting lost. You don't suppose I'm ashamed to tell on myself when I'm wrong, do you? Nelson's got as good a right to laugh at me as I had to banter Charlie Judd."

Some Characteristics.

"Ben is a patient, everlasting fisherman," said Mr. Woodbridge, "and if there's any fish to be caught he'll get them. Like most of the natives up this way, he's very fond of bull pout fishing, and many a night he has spent on the water. He is a magnificent rifle shot. I've seen him shoot across Clear Pond from the old hunter's camp and take a loon's head right off. Ben's eye is getting dimmed now and glazing over, but he used to have the finest sight of any man I ever knew."

"He loves that Clear Pond country, and wants to be buried there when he dies. It is a beautiful place, with its peaked, wooded hills and translucent water. The pond is fed almost entirely by springs which bubble up from the bottom. It has no inlet of any consequence, but there is always a considerable volume of water at the outlet. Ben has visited the place every year since he was a boy."

"Ben has never smoked, and he can't see what anybody wants to smoke for, anyway. 'It's all right, though, I guess,' he will say, when talking with a smoker. 'You look as if you enjoyed it, and I am glad of it.'"

Ben's Religion.

Ben is not a church member and his religion is of rather a primitive type. Sunday evenings in camp Charlie Judd used to sing hymns, and Ben took keen pleasure in listening to them, for not only was the melody sweet to his ear, but he was also impressed by the sentiment expressed in the lines. After hearing some of the Moody and Sankey hymns he stated it as his belief that any man who went by the words ought to come pretty near being saved. Someone read him the story of Fishing Jimmy one night, and the big, husky fellow cried over it.

He despises foul and mean words, though his vocabulary does not lack expressiveness in other respects.

"Ben has his prejudices," said a man who knows him from long acquaintance, "but I am bound to say he often strikes the truth. He goes directly to the root of a thing, and he sizes up a man with a woodsman's sharpness of perception on a half hour's acquaintance better than most educated men can in a much longer time. Speaking of a clergyman who visited me once, Ben said: 'Say, what did they make a minister of him for? Why, darn it, he ain't more'n half a man. He's all the time looking out for number one, and the hog shows out in him pretty much all over. He may be good enough to preach, but I'll tell you one thing, he ain't good enough for me to guide.' And Ben refused the proffered \$3 a day with the greatest contempt."

Rainy Days.

Ben, like his father, never bothered his head much about the future. He made no preparation against a rainy day, relying on his ready wits to help out of financial trouble—just as in the woods a few hours' labor suffices to provide a flimsy shelter from the storm. Once when his landlord got tired of waiting for his rent and threatened to evict him, Ben went to a friend and told

him he had determined to give his note for \$25 to raise the money.

He was very much surprised when the friend informed him his note was no good and that nobody would take it. The word had had a potent sound to Ben, and he confessed that he had always counted on this means of securing cash when all else failed. He had no idea of the significance of security, and naturally did not know that it is often harder to borrow \$25 than \$25,000.

"But I'll give my note for it," said Ben again, unable to comprehend the significance of what he had just been told. "Wouldn't you let me have \$25 on my note?"

"No," said the friend, "not 25 cents. But," and here he took out his purse, "I'm perfectly willing to let you have \$25 without your note. Here's the money, Ben, and you can pay me back when you get ready."

"Ben is not a prohibitionist," said another friend. "He knows good whiskey when he sees it, and his views on putting down the liquor traffic lead him to putting it down his own throat. He may take a little too much at times, but he knows how to stop, and when he was guiding I've seen him refuse liquor many a time. Ben's a good, square fellow, and it's a shame he has this failing."

Bear Incidents.

Ben has done a great deal of trapping in his time, but the bulk of his experiences in this direction will be buried with him when he dies. Those who know him best unite in saying that he is not given to talking about himself. The first bear he ever killed was one which he happened upon accidentally in the woods while hunting partridge with a small dog. The bear at first tried to get

BEN JOURDAN.

away, but the dog, on seeing it turn tail, thought he would expedite matters, and started after the bear as brave as if he had whipped it in a pitched battle. The cur's onslaught was too much for the bear's patience, and it turned on the dog and chased it back between its master's legs. The boy saw the bear coming and stood his ground, as the animal charged down an old woods road on the gallop. It was enough to make an older hunter nervous, but young Jourdan kept his wits about him and saved his single charge till the bear was within a few feet, and when he fired into the animal's head there was no need of an autopsy to determine the cause of death.

On another occasion, years later, when Ben was following a trapped bear, he had a somewhat puzzling experience. The trail, which had been plain enough up to that moment, ended at the base of a large spruce tree. Looking up the tree Ben could see the marks of the bear's claws, proving plainly enough that the animal had gone up the tree, but it was equally certain that the bear was not then in the tree, and Ben could find no trail leading away from the spot. He had never heard of bears flying, but he couldn't quite see how any other hypothesis would fit the case, until by chance, as he was examining the tops of neighboring trees, his eye fell on the bear trap lodged in the crotch of a soft maple. Investigation showed that the bear had crossed over from the spruce tree into the lower branches of the maple and then climbed the latter till, either by design or accident, the trap became wedged in one of the crotches so firmly that the bear was able to break away and make its escape. After getting free from the trap, the bear left no trail on the leaves with which the ground was strewn.

"It's no uncommon thing for bears to get out of traps that way," said Jourdan. "Now, there was McCoy, of North Hudson, who found one dead in a trap hanging in the tree, because his weight wasn't enough to break him loose when he jumped." And so he turns the subject from his personal experiences.

A School Girl's Essay on Old Ben.

One day in school one of Mr. Woodbridge's daughters, who is now Mrs. Le Wald, took Ben Jourdan as the subject for her exercise in composition. The description of the old woodsman is an excellent character sketch and true to life.

"No one who has been in Camp Lookout can ever for-

get Ben, our old guide. He is now nearly seventy years old, and his strength has almost gone, but his large frame and keen eye show what he has been. For thirty-five years he has accompanied my father in his camping trips, and we children look upon old Ben as a faithful comrade and slave. Who but he could find such quantities of nuts to bring us every fall? Who else could peel birch bark as he, and where could you find better paddles and oars for the little rowboat than those Ben made with only a knife and a hatchet? I have at home a pair of deer horns brought me one fall by Ben, after hearing of my disappointment in not being allowed to accompany my father to the Adirondacks. Many of his quaint sayings have been handed down from year to year until now they are told as camp legends.

"He was and is very fond of young people, and many a time when we have been laughing a great deal have I heard Ben's quiet remark: 'I guess you must 'a found a tee-hee's egg in a haw-haw's nest, ain't you?' No one could appreciate a joke better than he, nor did he fail to get one on us whenever an opportunity presented itself. On being asked one day if there were any wild beasts in the woods around camp, he quietly surveyed the questioner, who was attired in quite a startling costume, and he said (with a twinkle in his eye): 'They ain't many wild varmints around here, but I seen a good many wild garminits. Better look out or some one'll be scairt to death, and you might jest as well be eaten up by b'ars.'

"He was very surly with those whom he thought looked down upon him, and woe to the daring stranger who addressed him as 'Ben.' 'My name's 'Jordan,'" was his response to such undue familiarity. If, however, you respectfully addressed him as 'Mr. Jordan,' he was almost sure to say, 'Git out; everybody here calls me 'Ben.' He would never tell hunting or fishing stories. 'Thar's plenty of liars in the world,' was his usual answer, when urged to tell some of his experiences. And yet how pleased he was when someone repeated a story of his exploits, which he had heard from another source. He was a fine dance fiddler, and many a Virginia reel and quadrille have we danced in front of the big fire to Ben's fiddle.

"Sometimes he would sing to us, and what a treat it was to hear 'Brave Wolf,' 'Montcalm' and old-fashioned love songs, sung in his high-pitched, quavering voice. It was almost impossible to keep the younger members from smiling at times, so they were generally placed where he could not see them." J. B. BURNHAM.

An Open Air Service.

ABOUT 7 o'clock last Sunday morning we started with the dogs and walked quietly out of town, and when the paved streets gave way to the high road and the foot-path, we took to the fields, for there were no warnings to keep off the grass. At the first brook the dogs all took a bath, and we stood on the bridge and wished we could; and one of the party remembered how when he was a boy he had been in swimming in April—just couldn't wait. It was funny to watch the dogs; some were young and had to chase robins and sparrows and point frogs, while the older ones worked along unmindful of the unruly youngsters—perhaps they remembered the hard road they had traveled to perfection.

Just beyond, two of the dogs began to make game, and soon we had points from Max and Lee, and three hen Mongolian pheasants flushed and left the cover. We were glad to find these birds; for it was gratifying to know that they had wintered well. So we kept on until in another little run Tom and Lee pointed again, and we flushed a hen and a gorgeous cock, which made an outrageous noise for Sunday as he sailed away across the fields. From here we crossed an open field, where we started a partridge, which took to the trees, where we found her sitting on a limb with outstretched neck as still as though carved from stone. We all gathered under the tree, a small pine, took a picture of her and admired her trim form and beautiful feathers, and then quietly walked away, leaving her still on the limb, evidently chuckling to herself at how she had fooled that parcel of men and dogs. We will meet you again next fall, old lady. We found six more partridges and a woodcock, which whistled us its beautiful notes, and it was the sweetest solo on our Sunday programme. We saw a little snake sunning himself, so glad spring had come again. We heard the frogs piping praise; we heard the musical brook, tumbling over rocks.

We had left the house with the cares of the past week fresh in our minds, and we came home after fifteen miles of our open air sermon and song, better for the walk, better for the talk, better for the tonic in the air. The practical side of the walk showed us that our birds had wintered well and now we look forward to the brown days, and the red-letter days. Don't let us call each other names and denounce one another as "game hogs," but get the man who murders wantonly to walk with you on Sunday or on a week day; show him what you see; and next fall his mercy will extend even to the birds; and when you get more birds than he does he won't figure out how to load his gun so as to kill them all; he will be glad that some can get away. NOX-ALL.

The Mayflowers and the Mayflower.

CHARLESTOWN, N. H.—*Editor Forest and Stream:* The copy of magazine attachment shows that you have made some capital selections, and I am glad to see that you propose to include Col. Thorp's "Big Bear of Arkansas." I tried to think of the author's name a year ago, but it had gone from my memory completely.

I do not wish to seem too critical, but it seems my mission lately to "call down" somebody or other, and this time it is Fred Mather! To be sure, it is not much of a call, for he disclaims any knowledge of botany, but when he says the Pilgrims named their ship after the Mayflower he has got "the cart before the horse," for the epigea, mis-called trailing arbutus, is not known in England, and the tradition on Cape Cod is that when the Pilgrims saw this new flower they named it after their ship! VON W.

Just About a Boy.—XX.

INYAN KARA seemed just as near as it had been when the boy watched the sun gleam first on its top early in the morning, away down by the spring where we camped at the foot of the pine ridge.

The only difference was that the deep blue seemed to have faded out of the side of the old mountain and left it a lighter, smoky, indistinct bulk that was a little lower down on the horizon.

"Seems 'sough that hill don't git much funder off no matter how much we travel," said the youngster. "Here we bin goin' a day 'n' a haff, 'n' there's th' ole mountain juss liken't wus when we started, on'y yeh can't see none o' th' hollers on th' side of ut like yeh kin when yer clost up—'n' nen it don't set s' high 's ut did. Reckon that's cos we're gittin' kind o' over th' bend o' th' world like, 'n' yeh can't see 'round th' curve."

"You guessed the reason exactly," I answered. "By and by you will only see the top of it and that will look like a bit of cloud right on the horizon, and then when the sun sets you will see all the colors of the rainbow reflected from those old rocks where we ate our lunch the other day."

"Th' Bearlodge Range ain't th' same color 's Kara is. What's 'er reason o' that?" asked the boy.

"They are timbered clear to the tops, and are not as high as Kara. Timber always looks more or less blue in the distance—sometimes even indigo blue when the light is right. There is no reflected light, just the blue always, sometimes one shade, sometimes another, but always blue. Remember that in this part of the world, too, for it may be valuable when the cold northwest winds come down over this country and you need wood for a camp."

"Aw right; I won't furgit."

We were driving across the desolate country between the Black Hills and the Big Horn Range—a country that is baked and dry at all seasons except just while the winter snows are melting, and even then there is no water except a pool here and there in the dry beds of a long-ago creek.

Just now the weather was very warm for early summer, and the gray ground reflected the heat until the air was aquiver with it. A few stray flowers still struggled to bloom against the drouth, but they were stunted and undersized, and their colors lacked the brilliant hues of their kind that had come and gone with the meager moisture of the melted snow banks. Here and there the purple lake petals of the pincushion cactus made a spot of color in this gray desert—a few gaudy prickly pear flowers perched with half-closed leaves on the upper rim of one of the green pads, in close company with a tiny striped lizard, perhaps, for these little creatures basked in the sunlight or flitted across the barren, hot ground as the mood seized them. Mostly it was gray desert covered with grayer sage brush in the valleys and low places, and with rocks of a hundred hues to crest the hills or pile in picturesque abandon downward into the valleys.

"What's that? Looks like a town er sompin' way off there?" said the boy.

"Bad Lands. What you see there is the south edge of them, and it is a wrecked country from there clear up to the Missouri River, a good many miles to the north. That country is worse than this, for it is loaded with alkali, and has not even sage brush or grass to cover its nakedness. It is the bottom of an ancient lake, cut and gashed by erosion until it is now nothing but a country of a thousand hills, each hill with a flat top and built up of many-colored strata. There are no good springs there—all are thick with alkali. There is fire clay, coal, ashes, clay, sandstone, fossil monsters and petrified things up there till you want no more. It is a country of ruin, silence and death, my boy, and have a care that you do not stray far among those flat-topped buttes, for each one looks like each other one until you are puzzled and lose your way, then—well, there are many bones in there, and yours would not be noticed by a passer-by."

"Gee! That must be a' nawfull sort o' a place 'f that's th' case, but I'd like to get up clost 'n' have a look at 'em anyway," said the youngster.

"We will cross a spur of that country soon, and you will get all you want of it then."

"Whoa! Wait a minit—they's a whopper of a rattlesnake right back b'hind that rock, all curled up 'n th' sun. I want his skin." The boy had tumbled out of the seat and was running back on the trail as he spoke.

In a moment more he had picked up a fragment of a rock and battered the life out of a 6ft. "diamond back" rattlesnake. Then he pulled out his pocketknife, put his foot on the snake's neck and after cutting the skin clear around the reptile's neck he skinned the squirming body despite the muscular contortions and the singing rattles. "Ain't it a daisy?" he asked, as he came complacently back with the yellow-marked pelt dangling across his arm. "Goin' t' make a hat band o' that feller's jacket—one, two, five, nine, eighteen rattles—good string, ain't it? Well, ole feller, you won't never bite anybody else that's one sure thing, an' yer hide'll do me juss 's much good er more 'n' it would you, anyhow, cos you'd a shedded it anyway, 'n' 'sides, a feller 'd ought to kill a rattlesnake ever'time he sees one, juss same's he would er kiote er any other varmint uts-dang-rus 'n' no good."

He certainly had the Western idea about rattlesnakes, for no man who has dwelled in the grassland or ridden the range will pass by one of these dangerous snakes—cow men especially will always stop and kill them on sight, using the "honda" or the swivel end of their picket line for the purpose, or even just a loop of rope.

All through the hot afternoon we drove on across the gray desert, passing by the horned toads, the lizards and the cactus, until we were near the Belle Fourche River, in time for the night's camp.

"What's that white stuff over there; 'tain't alkali, is it? Seems too kind o' yellow," said the boy.

"Soap, natural soap," I answered. "That is something of a curiosity even in this country of strange things. It is actual soap, too, all right, and it is really a spring of soft soap coming out of the ground. You see the whole country here is loaded with alkali—to the west there is coal. Bed rock slopes toward the Black Hills, and in the lower country here along Wild Horse Creek and the Willow there are some oil springs, where crude petroleum comes up out of the ground. In some in-

stances the alkali and oil meet in about the right proportion, and you have one of these 'soap beds,' as the cattle men call them. They are dry on top, but soft under the crust, and cattle that try to cross them break through and sink into the mass of soap underneath and never get out. That is the reason the cattlemen have begun to fence these treacherous places. You see they look like dried up springs, and the cattle come to them in the hot weather looking for water, and down they go. Nobody knows how deep they are, but you can push a good many 10ft. poles down, one on top of the other, and when you are tired out some other fellow can push just as many more down on top of them."

"Gee, I don't want much to do with that kind o' a mess. Do they all look sort o' white 'n' crumbly on top like this one?"

"Mostly; some are more so, some are less, but the character is the same. Keep away from the edge of them even if you expect to be safe."

"Wont ketch me foolin' 'round no sich a trap 's that is, you bet," said the boy.

"Hol' on, gimme th' gun—saw a kiote juss sneak over that point down there—'m goin' after him." Away he raced up to the top of the next ridge like an Indian, and stood among the rocks waiting. The coyote with characteristic cunning had vanished, and the lad could not get a shot.

Coming back, he stopped every few feet and picked up something from the ground, so that when he arrived at the wagon once more he was loaded down with a hatful of rocks.

"Got some pet-ree-fide wood, 'n' things, anyhow," he remarked, as he climbed back on the seat.

In his collection there were fossil shells, petrified eels, wood, bone and other substances, turned to stone, and there were also some fine moss agates and carnelians, all gathered within a few yards of space, and there were tons of them left littering the ground for a long distance.

These things kept him interested while I drove down the long slope of hillside to the valley of the Belle Fourche and brought the outfit to a stop on the banks, where a bit of open glade stretched along among the switch willow breaks, and a few cottonwood trees offered dead wood for our camp-fire.

There was a pool there in the river I knew, and it was all the water we could get, though it was red with alkali, and the rim of the pond-like place was white with a frost-work of crystals all around it. Yet it was this or nothing. Ere the sun vanished our camp was made, the horses picketed and our fire going merrily. The coffee pot bubbled and hissed as the alkali water foamed inside, but we made good coffee just the same, because we put a few crystals of acetic acid in with the coffee to kill the alkali.

EL COMANCHO.

Notes of the Dumb Creation.

HAVRE DE GRACE, Md.—*Editor Forest and Stream:* Knowing that FOREST AND STREAM has always been a great friend to the dumb creation, as well as myself, I think that it might be a little interesting to its many readers to tell them a few very remarkable things that have come to my notice that should be credited to the dumb creation.

There is no room to doubt that the dumb creation is possessed of a large amount of benevolence; but I have only recently come to the belief that some of the birds that inhabit the earth do possess the power of reason. I think that I have sufficient grounds to establish my belief, of which I could give you many, but it is not worth while to take in the whole programme. I will tell you one instance.

A friend of mine gave a dinner to some of his old acquaintances, and this friend had a parrot that could talk the English language to perfection. Polly had a great curiosity to know what was going on about the house, and whenever she saw any strangers coming toward the house she would go out to meet them, and if the dogs would commence to bark she would say to the dogs, "Come out! Come out!" and then she would tell the visitors to walk in, and that the dogs would not hurt them. When a party was invited into dinner Polly also came in the dining room; and once, after they all got seated, one of the party told a very marvelous yarn. Polly was a very attentive listener and kept very quiet until the end of the yarn, and then she rose up full length and said, "Oh, what a lie," and then laughed, and so did all the gentlemen, and the one that told the yarn got very angry and said that he would give \$10 to be allowed to kill the parrot. I call that a clear case of reason.

I will now give you a case of benevolence. A friend of mine living near our city was bothered very much with crows in his cornfield and built a blind in his field where he could hide to shoot the crows. All who are acquainted with the crow family know that they have the reputation of being noted rogues. This gentleman tells me that while concealed in his blind there came two crows and lit down very close to him, and one of them had his upper bill shot off, so that he could not pick up a grain of corn; and the other crow would pick a grain of corn off the ear and put it in the mouth of the wounded crow. He shot both crows and found corn in the craw of the crow that had no bill to pick it up; and was very sorry about it. I call that first-class benevolence.

A farmer living in Hartford county has for many years very often invited the preachers of a Sunday to take dinner with him; and of course, as all preachers are very fond of fowls, his wife would have some killed and prepared for dinner. And strange to say, but nevertheless true, all his old gobblers and roosters by some means could tell a preacher by his looks; and just as soon as a preacher drove up to the house the old gobblers and roosters would call all their families to hide under the big barn and stay there until the preachers left. But upon one occasion two preachers drove up and no turkeys nor chickens could be found anywhere. But after dinner one of the preachers left and the old rooster came out and flopped his wings and told his family that the preachers were all gone; but the old gobbler was not satisfied, and poked his head out and said: "Doubtful, doubtful, doubtful." That was the first time that I ever knew that any of the dumb creation could count, as the old gobbler was certain that two preachers had driven to the house.

Another very remarkable instance. My son some time ago found a very large blacksnake that had caught a very large garter snake, and tried to swallow it. He had the garter snake about half swallowed. They both measured nearly the same size around the middle, but the blacksnake was 15in. longer than the garter snake. It was wedged in the blacksnake so tight that he could not pull them apart, and was sorry that he killed them.

Speaking about natural instinct, a friend of mine had a breed of small pigs and sold two of them to a farmer about twelve miles distant. The purchaser put them in a box and carried them home in a small wagon and let them out the next day. That night he missed his pigs and they found their way back to their home and mother.

Then again, a friend of mine living in Baltimore gave me a Chesapeake water dog and I shipped the dog to Havre de Grace in a vessel and had him only one day, when he found his way back to Baltimore by land on the third day; it is thirty-six miles.

The most intelligent family of wild fowl that visit our waters is the wild goose family. They do all their feeding at night. They are very noisy all day when they are sitting out in the middle of the bay or river, but at night, when they visit any of our warm rivers and creeks to feed, they never say a word, not even whisper. Day or night they are never without a watchman, and when he gives the signal of warning they are up and gone, and then they can be heard for miles.

E. B. GALLUP.

Moose on Railroad Tracks.

DRUMMONDVILLE, Que., April 24.—*Editor Forest and Stream:* Since writing you a few days ago from Sutton, Que., regarding deer in the Eastern townships, I have had occasion to visit this section of the Province, and have heard some interesting sporting notes that shall be chronicled for FOREST AND STREAM. The first incident occurred only a few weeks ago, between here and Wickham. Mr. Jim Timmons, track foreman, and one helper from Wickham were running a bumper car on the Canadian Pacific Ry. some three miles north of that place, when they were stopped by a huge moose that confronted them upon the railroad track; they were obliged to stop their car and back up out of his lordship's way, as he held full possession and refused to budge an inch, merely shaking his head and looking our friends over very closely. Mr. Timmons backed up his car a mile or more and tried to borrow a rifle, but could find none, and the moose, after holding his ground for the best part of an hour, easily stepped over an ordinary Page wire fence that inclosed the railroad property at this point and very leisurely made his way off into the woods. Mr. Timmons says the animal's horns must have stood 10ft. or more from the ground, as he stood with head erect, a perfect picture of strength and beauty.

Another incident occurred about two years ago on the Drummond County Railway, the headquarters of which are situated here. A freight train was making for this point, and when about ten or fifteen miles from here, a huge moose suddenly appeared upon the track ahead of the train and made a stand to stand off the locomotive. The train was running at a fast speed when it struck the animal and knocked him down the dump. The trainmen stopped the train, backed up to the animal, bled him, and loaded him on to a flat car and brought the prize into this station. The incident is vouched for by Mr. Wm. Houston, former superintendent of the D. C. Ry., who resides in this village.

The writer has seen during the past week plenty of deer tracks and runways between this place and Wickham; the distance between the two points is about nine miles. This section of country used to be alive with work and business, but it is now rather dead, most of the mills in the woods hereabouts having closed for want of material to work on, and the result is stagnation. But deer thrive, and the old logging roads are ideal places to still hunt this noble game. Very few hunters find their way into this section, and as a result the deer and moose thrive comparatively unmolested. Mr. Edward Carpenter, the veteran section foreman on the Northern Section of the Canadian Pacific Ry. south of here, informed me to-day that one day the past week three deer ran out of an old barn that stands near the track some three miles from this village, scared out by the noise of his handcar when passing. He says that he sees deer nearly every day when passing over his section. Mr. Wm. Houston, at present roadmaster on the Drummond County Ry., informed me to-night that no less than three deer have been killed by their trains within a few miles of here, within the past few months, and two moose met their end in the same manner during the past two or three years. I have promised myself (D. V.) a week's outing in this vicinity during the coming autumn, and if success crowns my efforts will chronicle the same for FOREST AND STREAM.

I would like to ask some of your correspondents a question regarding the difference in size of Adirondack and Lake Megantic (Quebec) deer. In the autumn of 1898 I spent six weeks in the Adirondacks around Saranac Lake, Lake Flower—Lake Placid—down through the Wilmington Notch, and as far as Jay, New York, and saw many small deer brought out of the woods. In November and December of 1897 I was in and around Lake Megantic, Ditchfield and Spring Hill, and I saw dozens of deer brought out of the woods, and they seemed as a rule to be larger and finer animals than the Adirondack product. How is this accounted for? Or am I wrong in my observations? Of course the Adirondack open season began on Aug. 15, while the Megantic season only opens on Oct. 1, one and a half months later. This may account in part for the better look of the game. I think Megantic turns out four deer to the Adirondack's one, i. e., for the section visited by myself.

WM. BROWN.

[Something is wrong about the first of these moose or the date at which he was seen. Moose do not carry horns "a few weeks" before April 24.]

A second edition of the April number of the Game Laws in Brief and Woodcraft Magazine is now printing and will be ready immediately.

Natural History.

Some Indian Natural History Comments.

Editor Forest and Stream:

Some months ago in your columns I made mention of statements made to me by Blackfeet Indians that the shore lark (*Eremophila*) had been found nesting in the thick hair between the horns of a living buffalo bull, and subsequently (FOREST AND STREAM, Vol. LI., p. 424) Mr. E. B. G. Haymond stated that the same thing had been told him by other Indians living in a buffalo country far to the east of the Blackfeet.

It has been suggested that this story is inherently improbable, because the birds having their nests in such a position would lose it, as the animal which carried it moved from place to place. This has not appeared to me a good objection, for I believe that each buffalo bull has its own individuality, and may be readily recognized, just as in a herd of red cows the farmer knows each one by sight, or the shepherd his individual sheep, if the bunch is not too large. So I think the birds, before their nest was built, would learn to know their own bull. Besides, there are, I think, some cases on record where birds have built their nests in vehicles moving from place to place. I have not until recently been able to put my hand on any such reference nor to find any ornithologist who could point one out to me.

Not long since, however, I found in Land and Water of 1877 mention of a sparrow's nest inside the cavity of an iron buffer of a railroad wagon, and in a communication dated St. John, N. B., Nov. 30, 1877, a correspondent signing himself Tantramar wrote to FOREST AND STREAM as follows: "In the spring of 1859 a pair of robins took possession of one of the pigeon holes (*i. e.*, a receptacle for papers, way bills, etc.) of the guard's brake van on the Essendine & Stamford Railroad, Rutland, England. Industrious the happy pair worked during the time that the van was at Essendine (for this van ran through and returned from Stamford three times a day, a distance of twenty-eight miles), until the nest was completed. The female laid five eggs and incubation commenced. She was carried to and from Stamford some ten or twelve times. But this happy state of things was suddenly brought to an end by an ignorant Nottingham drummer trying to secure the little bird by putting his hat over the nest. Mrs. Robin could not brook this intrusion. The nest was forsaken."

I have heard of a pair of sparrows building their nest in a ferryboat which plied between two banks of a river, but cannot locate the place. I have also a vague recollection, but cannot locate the statement, of a pair of wrens having built their nest in a wagon which passed daily back and forth between two neighboring towns.

On the whole, I think there is no force in the objection that the parent birds would lose the buffalo which carried their nest.

In the same contribution I called attention to a belief of the Blackfeet that the chickadee "counts the months of the winter on his tongue"; that if you kill a chickadee in the spring and open its bill and look at his tongue you will see under the tongue five others, the six representing the six months of the winter, or November to April, both inclusive. On this subject Mr. Frederick A. Lucas, curator of comparative anatomy in the United States National Museum, and well known as a student of the tongues of birds, writes me: "This note is really very interesting, or while it is not quite exact as a matter of scientific fact, it is actually based on the structure of the chickadee's tongue. The tongue in *Parus* is a little four-tined pitchfork, the tines growing out from the under side of the tip of the tongue. To anyone opening the bird's mouth and looking in, these tines would seem to lie just under the tongue. While the tines are four in number, they are often split, and one might imagine five."

The structure of the under part of the tongue is well shown in the figure given in Mr. Lucas' paper on birds' tongues, published in a report of the National Museum.

As to the butterfly and its sign, I am permitted by the editors and publishers of the American Anthropologist to quote here a brief article which I sent to the January (1899) issue of that periodical.

"The Butterfly and the Spider among the Blackfeet."

"Not very long ago, in FOREST AND STREAM, I called attention to the belief held by the Blackfeet Indians that dreams are brought to us in sleep by the butterfly (*ih' a'nni*). As my informant said:

"You know that it is the butterfly who brings us our dreams—who brings the news to us when we are asleep. Have you never heard a man say, when he sees a butterfly fluttering over the prairie, 'There is a little fellow flying about that is going to bring the news to some one to-

night'? Or have you not heard a person say after night, as the fire burns low and the people begin to make up their beds about the lodge, 'Well, let us go to bed and see what news the butterfly will bring'?"

"I called attention also to the sign for the butterfly—a design roughly in the shape of a maltese cross, one arm horizontal and the other vertical, which is painted on most of the more elaborately ornamented Piegan lodges, just below the smoke-hole and between the wings at the back of the lodge. This sign painted on a lodge indicates that the style and method of painting the lodge were taught the lodge owner in a dream. More recent inquiry leads me to suspect that the influence of the butterfly is not confined to dreams, but covers sleep as well.

"It is still a custom for the Blackfeet woman to embroider the sign of the butterfly in beads or quills on a small piece of buckskin, and to tie this in her baby's hair when she wishes it to go to sleep. At the same time she sings to the child a lullaby, in which the butterfly is asked to come flying about and to put the baby to sleep.

"The word *ih' a'nni* appears to have some relation to *ih' a'nni*, which means 'talking around,' or 'talking in different places,' 'to go about telling news.' *A'wa'ni*, 'he says'; *ih' a'wa'ni*, 'he walks about.' The prefix *ih'* seems to denote presence or existence in different places.

"I have not been able to learn why or how the butterfly brings dreams or sleep. It is stated merely that it is soft and pretty and moves gently, and that if you look at it for a long time you will go to sleep.

"How widespread the faith in the butterfly as the American sleep-producer may be—and this cross as its sign—I do not know. My direct testimony comes only from the Blackfeet, but the belief may well have been shared by their old-time allies, the Atsena or Grosventres-of-the-prairie, and the Sarsi, who with three tribes of the Blackfeet nation—Siksika, Kainah, and Pikuni—made up the five tribes of the 'Prairie people.' It is suggestive, too, that on the head of a Kutenai baby-board in my possession, there are embroidered three conven-

women pray briefly to the spider and ask help from its intelligence.

"It is unnecessary to refer to the position which the spider holds in the beliefs of many other tribes. The subject is a familiar one. I may call attention, however, to the fact that among both the Cheyenne and the Arapaho the same word is used to denote 'spider' and 'white man,' and that in both languages this word appears to convey the idea of high intelligence, being almost the equivalent of 'wise or intelligent one.'"

GEORGE BIRD GRINNELL.

Western or Yellow-Haired Porcupine

THE western or yellow-haired porcupine (*Erethizon dorsatus epixanthus*) is one of the few mammals that is not confined to any particular life zone. In the high mountains of the West, even to timber line, and sometimes making excursions above it, they are found, as well as in the sage and grease brush flats in the valleys, thousands of feet below. It is also the only animal of any size and abundance that can be killed without firearms, and for that reason the Canadian Government has passed a law protecting it. Many a hunter, trapper, or prospector, who has had the hard luck to lose his way, burn his outfit, or swamp his raft while far from home, has found the porcupine a Godsend. On the other hand, they are a great nuisance about camp, and during the absence of the hunter they are apt to gnaw into his cabin and do considerable damage. They enjoy gnawing into caches improperly made by a tenderfoot and going through his grub.

In the valleys, they may be found during the day, resting in clumps of bushes, or asleep on the low limb of a cottonwood tree along a stream, while in the high mountains they make good use of the large tracts of slide rock that occurs so abundantly at and above timber line, in the Rockies, Sierra Nevada and Cascade ranges. These animals do not hibernate, but during the winter live on the bark of alder, willow, cottonwood and pine trees, together with what roots and grasses they are able to find on places blown free from snow. While traveling in the Wind River and other mountains of Wyoming several years ago, I saw large numbers of trees that had been gnawed, and in some instances completely girdled by them. In this one section the damage was very extensive. Not far from the same place I saw four feeding in one small grassy park. During summer they subsist on tender shoots, roots, fruits, buds and grasses. A ranchman in Washington once complained that one was making raids on his garden, and ate his vegetables, among which he mentioned apples that had fallen from the trees. A few days later he caught the animal.

During the day they usually remain quiet, appearing about sundown, or earlier during the dark days of the winter months, and it is by no means uncommon to find them prowling about at midday, although properly speaking they are nocturnal. They are usually found singly, but on one occasion I met two together. (The four I have mentioned as seeing in a single park were far from each other.) They move slowly, the zigzag imprint of their tail left in the snow or dust being caused by the rolling motion of their body. Their sight, as well as scent, seems to be very imperfect, and I have repeatedly ridden up within 20 ft. of them on horseback.

During the summers of 1895 and '96 I spent several months of each year collecting specimens of natural history in the Rocky Mountains of northern Alberta, Canada, during which several amusing incidents with these animals occurred. At the time, my camp was pitched at Jasper House, in the pass bearing the same name. I had a line of traps set in a rocky bluff on the other side of a swift-running stream, and when fording it, for fear of falling and wetting my gun, I would leave it at camp. It was while out looking at this line of traps one day that I chanced to run across a porcupine, huddled up on a low limb of a large cottonwood tree. His back rested against the back of the tree. As I ascended the tree he did likewise, until we were both as far as we could go, and yet he was out of my reach. Here was a problem that took me several minutes to solve. If I shook him out, the probabilities were he would fall on me. Finally, with my hunting knife, I cut the limb, so that I could push it over and break it off, which I did. Down went the bunch of quills through the branches, and I followed via the trunk. He struck with a heavy thud, and after lying there a few seconds (he had fallen fully 65 ft) he gained his legs, and when I reached the ground was making off toward some rocks. I overtook and secured in him a good specimen.

At another time, while returning from a hunting trip one moonlight night, I saw several. There was about 1 ft. of snow, which helped to make it all the lighter. During the five-mile ride, most of the way of which led through the edge of the timber close to timber line, I encountered several of these animals. They were all in the open timber, or small parks, feeding on the bare spots which the wind had swept clear of snow. At my approach they shuffled off for some place of retreat, but if closely pur-

Showing the crosses on the Medicine Lodge.

tional sprays of flowers, each flanked on either hand by a cross, which certainly would have signified the butterfly as the sleep bringer, if the board had been ornamented by a Blackfoot woman. Crosses appear on two baby-boards figured in Prof. O. T. Mason's paper on Primitive Travel and Transportation.*

"On a very large lodge shown in an old photograph of 'Southern Cheyenne wigwams,' kindly loaned me by the Bureau of American Ethnology, appear four maltese crosses, quite like those shown on some Blackfeet lodges, except that they are much larger and are differently placed on the lodge, being in pairs one above the other. The upper series is well below the smoke-hole, and the lower is just above the ground painting, which seems to extend 4 or 5 ft. up the side of the lodge. It looks as if the complete upper series of crosses runs entirely about the lodge, and the lower series also, except where interrupted by the door.

"Still more to the point is the fact that on some prehistoric Hopi or Moki pottery collected by Dr. J. Walter Fewkes, and now deposited in the National Museum, appears a figure identical with the Blackfoot sign for the butterfly, and in close juxtaposition to it the unmistakable figure of a noctuid moth. It will be interesting to learn whether this belief in the butterfly as the god of sleep and this same sign for it have any general currency among the Western Indians.

"The use among the Dakota of the Latin cross to denote the dragonfly as a warner of the approach of danger is interesting in this connection.

"The Piegan Blackfeet call the spider 'underground deer' (*ksu' a'wa' kōs*), no doubt because of its rapid movements and the readiness with which it disappears from sight when disturbed. Its activity and supposed intelligence cause the Indians to hold it in high esteem. In ancient times there were religious beliefs and a ceremony about the spider, and though much of this has been forgotten, the animal still possesses a more or less sacred character among these people, so that even to-day in the ceremony of the medicine-lodge, the medicine-lodge

* Smithsonian Report, 1894, pp. 516, 517, Figs. 207, 208.

sued would stop, duck their heads, bristle their quills and switch their short, stubby tails from side to side. No matter which way I turned, the porcupine always kept his back toward me; it was impossible for me to get at his head. It was remarkable what an amount of hammering on the back one of them would take before he would succumb, and yet a light blow on the nose was sufficient to kill them. The skin is rather thin, and the quills so lightly attached that a light blow from a stick is sufficient to knock some out, many of which stick to the club. Many persons who have not had any experience with porcupines, believe that they have power to throw their quills, which is not so. I remember reading an article written by a man who supposed that he had had a narrow escape from one of them. As I remember, he came suddenly upon the animal, climbed a tree, a limb broke, he fell to the ground a few feet from the porcupine, and his miraculous escape he could never account for.

Again, while hunting little-chief hare (*Lagomys princeps*) in a large tract of slide rock, at timber line, I was entertained for some time by one of these animals. I was waiting for a "coney" to appear, when my attention was attracted to a slight sound at one side, and turning, I beheld a porcupine watching me from an elevated position close by. Evidently I had disturbed him in running over the rocks, or he had come out to sun himself. He gazed at me a few minutes, then came a few feet nearer, sat on his haunches, with his front feet held in the air, like a squirrel, then he licked his paw, scratched his side and shook himself, advancing until he was not more than 50 ft. from me. His actions were very comical, and he reminded me more of a monkey than a rodent. As I got up to leave, he took refuge among the rocks.

Regarding the habits of a Canadian porcupine (*Erethizon dorsata*) that Audubon and Bachman had in confinement, these gentlemen say (Quadrupeds of North America, Vol. I., pp. 280, 281): "It was occasionally let out of its cage to enjoy the benefit of a promenade in the garden. It had become very gentle and evinced no spiteful propensities; when we called it, holding in our hand a tempting sweet potato or apple, it would turn its head slowly toward us and give us a mild and wistful look, and then with steady steps advance and take the fruit from our hand. It then assumed an upright position, and conveyed the potato or apple to its mouth with its paws. If it found the door of our study open it would march in and gently approach us, rubbing its side against our legs and looking at us, as if supplicating for additional delicacies. We frequently plagued it in order to try its temper, but it never evinced any spirit of resentment by raising its bristles at us; but no sooner did a dog make its appearance than in a moment it was armed at all points in defense. It would bend its nose downward, erect its bristles, and by a threatening, sidewise movement of the tail, give evidence that it was ready for the attack."

I had a dog that would attack every porcupine he found, and of course came out worsted in every round, but experience was no teacher to him; he did it again the very next time he had a chance. Frequently he came into camp with his head full of spines, which necessitated my gagging him and withdrawing them with a pair of pincers. Several spines in his paws, that he had broken off, worked through in the course of a few days, and were extracted from the other side. A half-breed Cree Indian told me that once while eating a piece of porcupine meat, of which these people are very fond, he got a quill fastened in the roof of his mouth, and in trying to pull it out, the point broke off, and a week or ten days after the piece worked out of his nose.

The flesh is dark, tender, but of a rank taste, and hard to become accustomed to.

I was once hunting in the mountains of Wyoming, when I saw a pine squirrel (*Sciurus fremonti*), sitting on a log, acting altogether too quiet and unnatural for so spry an animal. He was all huddled up, and took no notice of what was going on about him. I crept close to him, and from the side of his neck saw several porcupine quills protruding. Whenever I got within 4 or 5 ft of him another squirrel in a tree near by chattered and aroused him. Several times I was on the point of striking him with a stick, when the other squirrel gave the alarm, and at last he went up a tree. I would have shot him, but deer and elk tracks were abundant, and I did not feel like risking a shot and scaring the game, not even for science. I have often wondered how the squirrel got the quills in him; surely it was accident. Possibly, while playing, he ran quickly around the trunk of a tree and surprised the porcupine sleeping on a limb, and received a blow with his tail, or he may have jumped upon the animal's back, taking it for a stone. I am quite sure that he died from the wounds in course of time, for the action of the muscles would work the spines further into the flesh every day.

Mr. E. W. Nelson, in speaking of the western porcupine (Natural History Collections made in Alaska, p. 274), says: "The Indians and Eskimo are very fond of its flesh, and, with the exception of the wolverine, are its only enemies."

From Audubon and Bachman (Quadrupeds of North America, Vol. I., p. 285) I copy the following: "We have mentioned in an article on the Canadian lynx that one of those animals (referring to the Canadian animal) was taken in the woods in a dying state, owing to its mouth being filled with porcupine quills. We have heard of dogs, some wolves, and at least one panther that were found dead, in consequence of inflammation produced by seizing on porcupine." Dr. C. Hart Merriam, in his "Mammals of the Adirondacks," p. 301, says regarding this subject: "The porcupine, owing to the formidable dermal armature, has but few enemies. Chief among them, as has already been shown (Vol. I., pp. 30 and 48-50), are the panther and fisher, and since these prowling carnivora have become rare in the Adirondacks, the porcupine has been, and still is, on the increase. He is occasionally attacked by wolves, eagles and the great horned owl." In a foot-note the same author says: "In FOREST AND STREAM of March 20, 1884 (p. 144), Mr. J. L. Davison, of Lockport, N. Y., states that he has recently examined a golden eagle that had been shot at Plessis, Jefferson county, N. Y. He says: 'The feet of the eagle were full of porcupine quills, which was probably the last animal he had dined off, and about as hot a meal as he ever had.'"

On turning to the pages referred to above, I find the following: "Cougars are either particularly fond of porcupines, or else are frequently forced by hunger to make a distasteful meal, for certain it is that large numbers of these spiny beasts are destroyed by them. Indeed, it often happens that a panther is killed whose mouth and lips, and sometimes other parts also, fairly bristle with the quills of this formidable rodent. Porcupines are such logy, sluggish creatures that in their noctivagations they fall an easy prey to any animal that cares to meddle with them." In speaking of the fisher (*Mustela pennanti*) he says: "Sir John Richardson tells us that 'its favorite food is the Canadian porcupine, which it kills by biting on the belly.' Corporal Lot Warfield, who writes of this animal from western Vermont, states his experience as follows: 'I agree with Penobscot that they are not plenty, but account for it on different grounds, namely, its fondness for the flesh of porcupines, whose quills often prove fatal to it. I have several times found the quills buried in the bodies, besides quantities of flesh, hair and quills in the stomach and excrements, and from this gained a point in baiting them. Let other trappers try it.' Continuing, the writer, Dr. Merriam, says: "During a recent visit to the north shore of the Gulf of St. Lawrence I was informed both by an agent of the Hudson's Bay Company and by trappers themselves, that porcupines constitute a large and important element in the food of the pekin (fisher). Mr. Nap. A. Comeau, of Godbout, who secured me a large and handsome male of this species, tells me that its intestine contained hundreds of porcupine quills arranged in clusters, like so many packages of needles, throughout its length. In no case had a single quill penetrated the mucous lining of the intestine; but they were, apparently passing along its interior as smoothly and surely as if within a tube of glass or metal. Mr. Comeau could not discover a quill in any of the abdominal viscera, or anywhere in the abdominal cavity, except as above stated. A great many, however, were found imbedded in the muscles of the head, chest, back and legs, and it was remarkable that their presence gave rise to no irritation, no products of inflammation being discovered in their vicinity. In examining the partly cleaned skeleton of this specimen I still find some of the quills in the deep muscles and ligaments about the joints. A knee in particular showed several in its immediate neighborhood. One is deeply imbedded in the dense ligament alongside the patella, three lie parallel to and close against the tibia, and two can be seen between it and the fibula."

It is probable that all of the quills entered the body while engaged in killing and devouring the porcupine, for those swallowed seemed to have caused no trouble after having fairly entered the alimentary canal. Therefore there remains no question whatever that the fisher feeds upon the porcupine, but I do not agree with Corporal Warfield in the belief that the "quills often prove fatal to it."

The Indians of the North use the quills in decorating their moccasins and for other fancy work.

J. ALDEN LORING.

OWEGO, N. Y.

Tree Nesting Ducks.

CALAIS, Me., April 20.—*Editor Forest and Stream:* I have been interested in reading what Mr. Mather and others say about tree ducks, and thought perhaps the experience of an old bird and egg collector might interest the readers of your natural history column. Fifty years ago we used to have six different tree ducks breeding on our river: barrows, golden eye and the buffle head (*albeola*) rare, but the common golden eye, the American merganser, hooded merganser and wood duck abundant. About fifty years ago pickerel were put into our waters, which soon put an end to most of our wild ducks breeding, as the pickerel eat up all the chick ducks except in the few lakes or ponds that were free from pickerel. Near to Calais are several ponds and lakes that are free from those fish, and the tree ducks bring their young to those lakes for safety.

I was at the Kendrick Lake, and a lad that lived near by was with me. A duck (whistler) came flying low toward us, when the lad threw up his hat with a shout, when the old duck dropped a young one that fell near us that was at least ten days old. The old one went for it so quickly I almost lost it, but I got it and put it in my pocket for a specimen. We were near the lake, and the old duck also, when we saw she had four others in the water. The boy says if we keep quiet she will go away and bring others, or if she is afraid of us very much she will take those across the lake or to the other lake. They were getting near to some water grass, when the old duck made a flutter, caught one and went across the lake; it was hardly two minutes before she returned and took another.

I don't think she took them by her mouth, and the one she dropped, if it had been in her mouth we should have seen it. Mr. Eastman, father of the lad, said they often took their young from one lake or river to another if they thought them in danger, and said he had seen them bring the young from the nest to the water and then in their bills, or to go any distance, or if they are any size carry them pressed to the body by the feet, and the boys often by a shout made them drop their young. They brought me several different kinds afterward, wood duck, whistlers and hooded mergansers, but no young of the large merganser.

Many years ago I was up to Grand Lake Stream salmon fishing, when I saw a large duck fly into a hole high up in a large birch tree. The log drivers said it was a sheldrake and had nested there many years. I was anxious to see what kind of a merganser it was. After the log drivers' day's work was done one of them by driving spikes managed to get up. The old bird flew out, and he brought down one egg, and said there were seven more. I then got the man to arrange a noose over the hole, and the next morning we had the old bird hung by the neck and the eight eggs were new to science. The log drivers said they had seen the old bird bring down the young in her bill to the water. Several years later Mr. John Krider, of Philadelphia, went with me to the same tree and collected the eggs. He was a well-known collector. Mr. Audubon was mistaken in his account of the nesting of this merganser

since he describes it as nesting on the ground among rushes, in the manner of the serrator, having a large nest raised 7 or 8 in. above the surface.

On one of my collecting trips my attention was called by the log drivers to a singular contest between two ducks; it proved to be a female wood duck and a female hooded merganser, for the possession of a hollow tree. Two birds had been observed for several days contesting for the nest, neither permitting the other to remain in peaceful occupancy. The nest was found to contain eighteen fresh eggs, of which one-third belonged to the merganser, and as the nest was lined with the down of the merganser it appeared probable this bird was the rightful owner of the premises. I once found a dusky duck's nest in a cavity of a leaning birch tree about 30 ft. high.

GEO. A. BOARDMAN.

The Harriman Alaska Expedition.

MR. E. H. HARRIMAN, of New York, who is taking his family to Alaska on a large private steamer, has invited a notable party of scientific men and others to accompany him as his guests. The party will leave this city late in May, and will be gone two months. It will not keep to the beaten track of travel, but will visit out-of-the-way portions of the coast of which the average tourist sees nothing and of which comparatively little has been written.

As at present made up the arts and the sciences are well represented in this party. There are geologists, botanists, topographers, ornithologists and mammalogists, and there are three or four artists and two men eminent for their literary ability—John Muir and John Burroughs.

The following gentlemen constitute the guests of Mr. Harriman, E. L. Trudeau, Jr., T. H. Carney, Department Agriculture Washington; E. S. Curtis, Seattle; F. V. Coville, Washington; Dr. W. H. Dall, Smithsonian Institution; D. G. Elliot, Field Columbian Museum; Prof. B. K. Emerson, Amherst, Mass.; L. A. Fuertes, G. K. Gilbert, Geological Survey; Drs. C. Hart, Merriam and A. K. Fisher, both of the Biological Survey; Dr. Lewis Rutherford Morris, Mr. John Muir, Dr. H. S. Pritchett, of the Coast Survey; Prof. Wm. Trelease, Botanical Garden of St. Louis; R. Swain Gifford, George Bird Grinnell, John Burroughs, Robert Ridgway, Smithsonian Institution; E. S. Dellenbaugh, Henry Gannett, Geological Survey; Prof. Wm. H. Brewer, of Yale, and Prof. W. K. Ritter, University of California.

The expedition is expected to leave Seattle, or some other Sound port, about June 1, and to proceed by the inside passage to Sitka and Skagway. Thence it will move north, taking in the Muir and Malaspina glaciers, the Mount St. Elias Alps, and from there cruising along the coast to Cook's Inlet, to Kadiak Island and perhaps beyond.

It is anticipated that great opportunity will be afforded for the collection of little known birds and mammals, and that important scientific results may be achieved. The opportunity for viewing the marvelous scenery of the Alaskan peninsula and of seeing out-of-the-way places is a remarkable one.

It is anticipated that occasional brief excursions will be made into the interior in search of some of the larger mammals, which are not only very desirable objects of the hunter's skill, but most interesting to science as well. Among these animals are the white sheep, named after one of the guests of the party, and the great Kadiak bear, named by one of the members. It is possible too that the steamer may get far enough north to reach the resting places of the walrus, though it is not likely to enter the Bering Sea.

Reason and Instinct.

Editor Forest and Stream:

Doubtless you feel that this discussion is growing lengthy, but I will only ask this one reply.

If I correctly understand Hermit, his challenge to name anything that is necessary to the existence of the lower animals which they do not comprehend, renders any reply from me unnecessary; I never claimed anything of the sort, and if knowledge of prime requisites to existence is the full definition of reason, then I know nothing of such reason in man. Hermit puts the argument I and my "ilk" make as, "The acts of animals which seem to indicate reason are null and void because of other acts which seem to indicate a lack of reason," and I accept that statement, if to it is added, "until the antecedents and all connected circumstances are examined, and fail to afford an explanation of the acts in previous experiences or habits, of the animal performing the acts."

If Hermit holds that the reason of the least intelligent of sound-minded men should not teach them that while grown persons are to be kept away from a child in its perambulator, a toddling child may be permitted to approach, I pity his estimate of human mentality.

Hermit's remarks about adoption are wholly illogical (or what is now the same, misleading), as I never referred to "adoption." It was substitution which I cited as indicating lack of reasoning power in dams.

"Mr. Wade and his ilk do not call on science to verify their claims. We know how gladly they would do so, if science was on their side." That statement is incorrect. But now for a bit of lay science. Hermit gives us lots of what is doubtless the correct article, as he knows it, but he makes statements which are incorrect. "Thus the dog's sense of smell is superior to man's." But no hound has a keener "nose" than many of those human beings both deaf, dumb and blind. To be able to distinguish one's clothing from that of another after washing and a year after that washing, to recognize that a friend is within several yards, to know and name every article of food on the table on entering a dining room seated for three hundred, to know there are many books in a room upon entering that room, to know one's books from others', to distinguish any kind of wood, to distinguish brass from steel, all by smell, is about as much "nose" as any hound I ever knew had (although, I admit, not equal to the American bloodhounds that followed a man's

trail after he changed horses without putting foot to the ground).

It is not logical to conclude that the lower animals reason because they possess the necessary organs for it. We all have the same organs of smell that the deaf-blind have, yet we normals cannot smell as they do. Hermit says: "It is one of Nature's laws that a useless organ soon disappears." It does, does it? How much "soon" is there in the continuance of the extinct third eye now surviving as the pineal gland of the brain? Surely it is a longer stretch of time than any "soon" since we were lizards.

I would suggest to Hermit that Lloyd Morgan's "Introduction to Comparative Psychology," "Habit and Instinct," "Animal Life and Intelligence," etc., can be had of Edwin Arnold, 70 Fifth avenue, New York, and somehow Prof. Morgan has enough "science" for me to sit at his feet and think that I am honored in finding him support my "claims." W. WADE.

Weight of the Raccoon.

Editor Forest and Stream:

Have you any record data at hand showing what weight the raccoon attains? My attention was called to this matter by an item in last issue of FOREST AND STREAM, relative to a 50lb. coon, said to have been killed recently near Bangor, Me. Very many people will question the accuracy of the scales upon which the 50lbs. was weighed, and I would perhaps be found among the doubting Thomases but for the following incident: About twenty-five years ago a young man named Schoolcraft killed, near the village of Fonda, N. Y., a raccoon that is said to have weighed 53lbs. The coon was weighed at the American Express in the village of Fonda, and there was at one time and possibly is yet, in existence a certificate signed by several reputable persons who saw the animal weighed, which certificate gave the weight at 53lbs. The heaviest one I ever saw put on the scales weighed 28lbs. and was a very large male. The largest I ever saw shot weighed less than 25. Domestic animals sometimes attain abnormally large weights, and no doubt wild ones do also. The weight of the coon killed near Fonda appeared to be quite well authenticated. S.

TROY, N. Y.

[Definite records of the weight of the raccoon are not accessible. It has always been our impression that the full-grown animal weighed from 15lbs. to 18lbs., but we have seen some that were much heavier, though none to equal the weight given above. We should be glad to have authentic weights from any correspondents.]

California Audubon Society.

REDLANDS, Cal., April 22.—*Editor Forest and Stream:* At the close of the meeting of the Contemporary Club at the Y. M. C. A. Auditorium last Monday afternoon, a meeting was held for the purpose of organizing a society for the protection of song and insectivorous birds.

It was decided to call the organization the California Audubon Society. Following officers were elected: A. K. Smiley, Redlands, President; Mrs. A. G. Hubbard, Mrs. G. T. Grunlied, Miss A. H. Partridge, Redlands; Mrs. Elizabeth Grinnell, Pasadena; Mrs. Isabel H. Baxby, Santa Barbara; Mrs. Caroline Severance, Los Angeles; Mrs. Geo. H. Dole, Riverside; Rev. T. H. Williams, F. P. Meserve, Kirk Field, H. L. Graham, Redlands; Prof. Everett McLoomis, Academy of Science, San Francisco; Prof. A. W. Anthony, San Diego; Prof. A. J. Cook, Claremont; Honorary Vice-Presidents. Secretary and Treasurer, Mrs. Geo. S. Gay, Redlands; Executive Committee, A. K. Smiley, Mrs. Geo. S. Gay, Harry L. Graham, Redlands. The following resolution was passed:

Resolved, That the California Audubon Society hereby appeal to all parents and teachers to prevent the cruel and wanton slaughter of our native birds by air guns, slingshots, parlor rifles, shotguns, etc., in the hands of the youth under their charge, and that they exert their influence and authority against the practice of egg collecting, now so prevalent among boys.

On payment of 25 cents anyone so wishing may become a life member of the society. REELFOOT.

Manitoba Elk Heads.

WINNIPEG, Man.—The largest wapiti or elk head killed last season in Manitoba measured 49in. along the beam; had thirteen points, and a span of 3ft. 4in. This is much smaller than some Montana or Wyoming heads, but a very large one for this Province, though not a record. ST. CROIX.

Salmon in the Oswego River.

Editor Forest and Stream:

In late numbers of your paper reference has been made to the former presence of salmon in Lake Ontario and its tributaries. Up to the time the Oswego Canal was constructed and the dams built, salmon in great numbers frequented the Oswego River, coming up each year from the sea through the St. Lawrence River and Lake Ontario to visit their spawning beds.

My father has told me of seeing shoals of them on bright sunny days, stopped by the shadow of the bridge at Oswego Falls, twelve miles above the mouth of the river, waiting until the sun was off the water to pass up; and at night of seeing the river covered with boats and canoes, the men in them spearing the salmon by torchlight. These salmon were never known to take a fly or any bait so far from the sea, except that a man fishing for trout many years ago on Salmon River (coming into the lake twenty miles below Oswego), at the foot of the high falls, took several grilse.

Some years ago fishways were placed at each dam on the Oswego; but the demand for water for power and for the canals at low water time, when the salmon were running up, was too great, and the fishways had to go dry.

Up to 1870, and perhaps a little later, salmon were occasionally taken in the whitefish nets set off the harbor of Oswego. FISHERMAN.

Game Bag and Gun.

Old Hudson's Bay Dag.

THE weapon and its sheath here figured come down to us from the olden time. These dags—so called—were the first knives furnished by the Hudson Bay Company to the Indians of the North, and most of them have long since been worn out, given away or lost. A few still remain, and are cherished more as relics and mementoes of the good old days than for any use to which they are put at present.

When the first white man came, he found the Indians using knives of bone, or of flint stone to skin and cut up their game. Strangely rude and useless they must have seemed to him, yet they served well the purposes of these primitive people. We may imagine that thousands of years before that, the Indians did not know even how to use a sharpened stone or bone for cutting, but that they tore their way through the tough hides to the flesh below with their teeth, or perhaps with a sharp-edged shell, or possibly with the tine of a deer's horn.

After the white man came, the first improvement in the

HUDSON'S BAY DAG AND SHEATH.

knives was by inserting a strip of tin or hoop iron along the edge of a bone knife. For, in those first days, of course, metal—this new and mysterious substance—must have had an enormous value for the Indians, and they must have used it as economically as possible. This strip of tin would take an edge and hold it for a little while, and thus give them a knife vastly better than anything that they had previously known. Soon after this, however, there were brought into the country these old-time dags, useful weapons which rendered far easier the labors of men and of women. These were employed for many years, but later the company sent in an improved knife, more useful for skinning and for the other purposes of camp life, but not nearly so good for war.

It was for this last purpose that in later years these dags were chiefly used, and each warrior when he entered a hostile camp for the purpose of cutting loose horses, carried his dag, slung by a loop to his left wrist. Very likely he might leave all his arms hidden outside of the camp, for an armed man walking through the camp with bow case and quiver and shield upon his back would be an object of curiosity and would be stared at and soon investigated by the people who occupied the camp. So the warrior who entered it, and who, above all things, desired to escape notice, was usually clad only in blanket or robe, and tried to be as inconspicuous as possible. Yet some arms he must have for his defense, and so he carried the dag swinging to his wrist under his robe, and ready at an instant's notice for the terrible forward and downward thrust which might rip open an enemy.

Our friend Bear Chief, who will be remembered by

many of our readers, was once stabbed through the lungs with one of these great knives, the point of which almost came out at his back, making a wound two inches wide, through which the wind whistled as he breathed. Many another man has been similarly cut up, and it is singular to notice how many of those stabbed in the chest recovered from their wounds.

As has been said, the dag is a relic of the olden time, almost as much so as is the bone knife which preceded it, or the still earlier knife of flint. The one here figured is a legacy left to its present owner by a friend, a brave Piegan warrior, who several winters ago left his people to join that greater throng who, in the Sand Hills, still hunt the buffalo that have long since vanished from the material world.

How the Bird Hid.

READING Pine Tree's article, I feel it my duty to write this explanation. The quail and ruffed grouse have the power to retain all scent under certain conditions.

When Pine Tree has hunted as long as I have, which is almost three score years, he will learn that the best-nosed pointers cannot locate a frightened quail which has dropped into the grass and leaves to hide when even less than a yard from their nose.

Last October, while hunting about two and one-half miles north of Hartford, with as good a Jewell setter as any man could wish to shoot over, the dog trailed a covey of quail about eighty rods and came to a point at some scattered brush at the roadside. I flushed the quail and stopped a bird with right and left, and marked the rest down in a cultivated raspberry patch not 50yds. away. Picking up my two birds, I went into the raspberries, which were in distinct rows, with my dog close at hand and my gun ready. I went up and down through that patch of berries both ways, following the rows, the dog hunting faithfully. But from the action of the dog you would not have thought there had been a quail there for a month. Knowing the power of the quail to suppress all scent for a short time, I called the dog and walked away 50yds. to an apple orchard and sat down and ate apples for fifteen or twenty minutes; then took my dog and returned to the raspberry patch, and the dog had no sooner entered the bushes than she came to a point. On the ground we had so recently been over, the dog found and I flushed and shot six quail. The situation was such that I positively know the quail were there all the time.

With the same dog my son and I killed forty-two quail and twelve partridges in one day.

Yet I have seen that dog within 2yds of a partridge on his drumming log and still unconscious of there being a bird in that neighborhood. The partridge will drum continually in places where there are foxes, skunks and other animals who would devour them were it possible to locate them by scent. If, when Pine Tree flushes a flock of birds that fly only a short distance, he will wait a few minutes before he puts his dog on to the ground, he will never have to kick the birds out. The dog can find them. For further proof of this fact I refer him to Frank Forrester's complete work on "Dog and Gun."

SULLIVAN COOK.

MICHIGAN.

Connecticut Grouse Snaring.

Editor Forest and Stream:

The last shooting season demonstrated the fact that partridges are unusually scarce in this vicinity, while woodcock and quail average about as usual. Sportsmen are puzzled over the scarcity of partridges, but a moment's reflection should reveal part of the cause.

The Connecticut law allows snaring on owner's premises. This license is eagerly grasped by land owners, who have always borne reputations as snarers. I write of what I know to be a fact, when I say that many post their lands to protect the snares they set on them. While they reap a reward through the medium of this lame law, yet they are filled with hatred of game laws in general. Many of them are too ignorant to realize the far-reaching benefits of good game laws; they think they are made by and for the benefit of a class. "Let me catch one o' them dudes that make the game laws on my land once; I'll have him arrested and shoved higher'n a kite." That's the way some of them talk to me.

From experience I will say that it is useless to undertake to reason with such men. You could never convince them that game laws are a benefit to them. Of course they believe in the law which allows them to snare on their own lands, but not in game laws in general.

Besides the partridge stranglers, there is a small percentage of farmers who kick against game laws because they have that privilege, and they would kick against anything else for the same reason. Ask them their reason and they will either evade your question or give an answer like this: "The birds don't belong to the city dude, and they've got a nerve to make laws so they can hunt over my land in the fall of the year. What right have they got to hunt on my land?" They don't hunt the birds themselves and would keep others from hunting them, simply because they themselves are chronic kickers.

For the benefit of my fellow sportsmen, I would say that a little flattery judiciously applied works to perfection on this material. Praise the appearance of their fields or of their cattle and horses, and you are in the right road to an invitation to "have a glass of cider? Won't you stop to dinner?" or "Say, you can hunt on my lands whenever you like."

Of course there are farmers, and many of them are staunch supporters of all game laws, who are compelled to post their lands. I talked with one of these persons recently and he said: "It was like drawing teeth for me to post my land. I am so near the city, however, that I was compelled to do so. It was bang! bang! bang! right around my door, all day long; and the rowdies and Italians broke down my fences, stole my fruit and even shot some of my chickens. I stood it all as long as I could before I put up the signs. Any decent man is welcome to shoot over my land, even now; but he must ask permission first." I know of a number of cases like this.

Now, it is not the "chronic kicker" who is the real enemy of game laws. Neither is it the farmer living near the city. The first would kick just as hard against doing away with all game laws as he does against existing ones, for it is his nature to kick. From motives of self-preservation the second would be compelled to post his lands, game laws or no game laws. The only real enemy of all game laws therefore is the natural lawless character who is too lazy to work and who chokes birds for money. He is the grown-up snarer.

It goes without saying that any law which allows snaring under any conditions is a lame one, and the sooner it is stricken from the statute books the better. Then another should be inserted in its place so strict against snaring that the very wording might scare a partridge strangler out of his wits. Such is the only kind of an argument that these people understand.

A couple of sportsmen, with whom I am acquainted, went out of town for a day's shooting early in the season. They went on the Derby R. R. Upon their return they told me how they had seen over 100 partridges delivered to the baggagemaster; not in one batch, but in small instalments at different places. They examined some of the birds and found they had been snared.

WILLIAM H. AVIS.

HIGHWOOD, Conn.

CHICAGO AND THE WEST.

Minnesota Forest Reserve.

CHICAGO, Ill., April 29.—What is perhaps one of the largest bits of out-door news turned up in years appears herewith in the *FOREST AND STREAM*. It is news which will be larger a year from now than it is to-day. Although it is always a long step from the inception of any enterprise to its completion, I think we may briefly cover this matter by stating that it is among the possibilities if not the certainties that the State of Minnesota, one of the most remarkable in the West, in the extent of its forests and in the wealth of its fish and game, will have set apart as a forest reserve, under the protection of the United States Government, a tract which will cover four counties, which will be 140 by 125 miles in extent, which will embrace the sources of the Mississippi River, and which will include one of the most remarkable sporting regions to be found anywhere in the West. It is a long way to the fulfillment of this possibility or this certainty. We may call the result reasonably sure, because it is to be backed by some of the broadest minded thinkers and some of the longest headed men of affairs to be found anywhere in the West.

Although an announcement like the above is practically news to the sporting press, and is news absolutely in regard to the sober features of an actual beginning in the working part of the enterprise, the matter of a forest reserve or "State park," in Minnesota, is not a new thing. At the last session of the Legislature of that State there was passed, "An act to encourage the growing and preservation of forests and to create forest boards and forest reservations." It invites the gift of land for forestry purposes and provides that any one who will turn over to the board a tract of land of not less than 1,000 acres may have the forest named after him."

On the above lines, Congress was memorialized by the Minnesota Legislature to set apart for the use of the public some 2,500 square miles of land in the Leech Lake and Winnibigashish district, and this action of the Minnesota Legislature may be perhaps called the first real step taken in a general way in the matter of the forest reserve. Following hard upon this legislative action, Mr. Chas. Christodoro, prominent in the lumber trade of that State, and a resident of St. Paul, wrote the first communication which I can discover upon the matter, being a letter to the American Lumberman, earnestly advocating the establishment of the reserve, and making use of the following words:

"Beyond the question of forest preservation is the interesting one of the conserving of the game. Deer, moose, elk and bear would thrive and multiply in this region of lakes and woods if controlled by the Government, and were it protected as is the Yellowstone. As a pleasure and outing ground for the people of the Northwest, it cannot be excelled. With its sixty to seventy lakes, in some of which the first line is yet to be cast by a white man, all of them teeming with muscalonge, pike, bass and pickerel, it affords an ideal spot for the lover of the rod and reel. The sportsman can count upon good flight duck shooting as long as the mallards and scores of other Northern ducks are allowed peacefully to rear their young within the confines of the score or more of rice lakes within its borders.

"We Minnesotians want this land and water as a national park. We want Congress to act favorably in the matter. We realize that the railroads, the timber hog, the town sites are all against the idea of making such a profitable piece of territory into a national park, and it is against such that we wish to prevail in our efforts to preserve for all time a pleasure ground for the people, where the canoeist, camper, tourist and fisherman can enjoy nature at her best and where, twenty years from now, after every stick of white pine is gone the way of the black walnut, one can walk under the massive cork pine giants and think of what a wooded paradise Michigan, Wisconsin and Minnesota were before the advent of the axe and saw."

Commenting upon the above, the editor of the paper mentioned endorsed the idea from the standpoint of the lumberman—this being endorsement from a source unexpected, for the rapacity of the lumber cutter is a proverb nowhere better exemplified than in this very tract of Minnesota, where twenty million feet of Government timber have been stolen outright. Taking the high standpoint of the thinking man, the editor above mentioned approved the view of the thinking lumber merchant and of the State Legislature, and went on further to say:

"The fame of Minnesota as an agricultural region has gone to the uttermost parts of the earth, but her greatest glory has properly been ascribed to the magnificent wealth of forest, lake and stream with which nature endowed her. The disfiguring of these beautiful areas, due largely to man's necessities, in part to fearful conflagrations and mostly to the consummation of commercial desire, has left a dreary waste of hundreds of miles of what was once

as fair a prospect as ever sun shone upon. The time is near at hand when utilitarian purposes can logically be directed to other sources, and is with us now when some reminder of the most glorious natural characteristic of the Northwest should be preserved not only for the benefit of those of this generation, but for the enlightenment, the instruction, the good health of and a refining influence upon the generations to come, to whom this generation owes a debt, emphasized by its richer resources and its loose stewardship of them and in which resources the coming generations should be conceded their undeniable rights.

"Miles of bare Northwestern land, unpromising as to future usefulness, thousands of acres of black and blasted stumps that offend the eye and insult the artistic sense, appeal for the preservation of some of the best of what is left in primeval growth."

In the same issue of the same paper, yet another thinking lumber merchant, Mr. W. B. Mershon, of Saginaw, Mich., came out with a letter reiterating practically the above, and showing yet further that the matter of a Minnesota reserve is not one which is going to be fought by all of the great timber companies operating in that State.

The above, so far as I can discover, covers about all of the reserve matter up to date. I confess I was not aware until to-day that so much had been done, and was writing to the *FOREST AND STREAM* upon a different line when I received a call from Mr. Christodoro himself, stating that he had been to New York and had talked with the Editor of *FOREST AND STREAM* in regard to this very matter, which I had written up, and had in my desk ready to mail! I had arrived at the same station by an entirely different road, and through news sources quite independent of the above.

I have still left to state that, while the matter of the forest reserve belongs to Minnesota, and has been first considered in Minnesota, it is sure that the first step toward active work for the attainment of this great purpose was taken by a Chicago man, and taken within the last few days. Justice requires this statement, though the enterprise itself is too large to be held even within the bounds of all Minnesota. Chicago will not rest content with this credit, and indeed would disclaim any intent to call this a Chicago undertaking, for it belongs to the whole United States. The best and greatest news about the whole thing is that it seems far more than likely that the matter is now past mere beginning and will not be allowed to rest until it has attained success or absolute rejection by the Congress of the United States.

The Man With an Idea.

Years ago when the muscallonge country of Wisconsin was just opening up, one of the most ardent pilgrims to that favored land was a well-known Chicago attorney, Col. John S. Cooper. Col. Cooper is not a politician, but attorney. He won his title honestly in the Civil War, and he has earned the title of sportsman over and over since that time. He was fond of exploring, and there are few lakes of the Wisconsin chains which have not known his boat or canoe. After the glory of Wisconsin began to depart, in some measure, with the advent of the new roads, Col. Cooper turned his face to the less known wilderness of Minnesota. Years ago I predicted that Minnesota would be the next State to be reached by the throng of angling travelers, and this prediction has been fully verified. It was only two years ago that Col. Cooper made his first muscallonge trip in that State. Before he had ended his first outing in the great wilderness of upper Minnesota, he was a devotee to that region, and a convert to one idea. He resolved then and there to spend the remaining years of his life, if need be, in the effort to secure the preservation, intact, so far as that might be, of that great stretch of wild country about the head of the Mississippi River. He saw that the rapid denudation of the forests by the lumbermen must surely be followed at no late date by the most serious consequences in the flow of the head waters of the greatest American stream, probably also by a distinct change in the climate of the region. He saw that the fish and game, even now rapidly passing away, must soon become practically extinct there, as they have in other regions left open to the tender mercies of State laws and the unchecked impulses of eager human nature. It was not enough to Col. Cooper to go on and take what he could of the fish and game of this country, though without doubt its resources would outlast his time. It seemed to him better, indeed it seemed to him imperative that something should be done to keep this wilderness so that the American people might have one more chance to see how noble a thing its original heritage had been.

Col. Cooper was the man with the idea. He was the man with the enthusiasm. He was the man with the purpose and the energy. At the beginning of every considerable enterprise you will find some such man. Sometimes he is overridden, and often he is forgotten, and often he fails. At this point, at what I take to be the first written word in the sporting press regarding this enterprise, I wish to make it clear in the record, that should the State of Minnesota and the people of America win this great forest reserve, the credit for the first working steps toward that fact belongs, and should be given, to Col. John S. Cooper, lawyer and sportsman, of Chicago, who began the work not for glory nor for advertising, but because he loved the woods and streams.

Plan of Campaign.

A great many persons have ideas, but it is very gratifying to state that in this case the idea was not allowed to rest in embryo. Col. Cooper saw some men in Minnesota to whom he mentioned his proposition in part. He met at St. Paul a gentleman who offered suggestions of greatest value. He took counsel among certain Chicago friends, who promised him support, and he found outside this city and outside both these States, other broad-minded men who saw at once that this enterprise was not a personal one, but one of national importance. I need not describe all the steps that have quietly been taken here for the past few weeks, and which have been fully known to myself. Let it be enough to give below a brief sketch of the plans which have been outlined for the furtherance of the main proposition.

In the first place, this work of moving for a Minnesota

forest reserve is not a Chicago enterprise, and it is not a personal enterprise. It is already far beyond both these phases. The matter belongs to the United States, and will need to be brought before the Congress of the United States. Should it come before that body as a mere proposition, should it appear as a political measure, or as a scheme for the benefit of some persons or corporations, the fate of the measure might be written now. Yet more, should it approach Congress in a loose and indefinite form, something perhaps good but vague, something perhaps desirable but not definable, the result of failure might again be prophesied. Still more than this, were this proposition never so clearly and convincingly put, it none the less might fail, if it came before members of Congress who, while they might be willing and anxious to approve the measure if it seemed of great popular benefit, might themselves be too personally ignorant of the region and the data regarding it to act with perfect understanding in the matter.

All these contingencies have been foreseen. It may be said with a certain pride that they have been guarded against with a certain Western largeness and thoroughness. Chicago claims no more than the first step, but the first step, being the one which counts, would appear to have in this case to have been well considered. In a short time there will be a meeting of a few prominent men of Chicago, let us hope of such men as George E. Cole, president of the Municipal League; Edwin F. Daniels, president of the Tollester Club; Judge Grosscup, of the Circuit Bench; Ruthven Deane, foremost ornithologist of the West, and a few other such men, men of social rating and conservative thought, who will be asked to meet as a body for preliminary organization. After such organization there will be invitations sent out to similar men in other States, men of the kind who are not content with passing resolutions. Thus there will be formed, and I think formed at no very late date, a body of American thinkers. I shall not call this a body of American sportsmen. This is by no means a sportsmen's measure, for all classes are interested in it, though sportsmen are primarily so. This body of American thinkers will be one whose invitation will carry weight and be entitled to respect.

An Invitation to Congress.

Soon after the formation of this representative body, which will be sometime this summer, and at the earliest possible date, there will be issued to some sixty members of Congress an invitation to go out and see this wilderness of Minnesota, to see it personally, and to examine it thoroughly, in such way that they may be able to vote understandingly on any measure regarding it and may be able to give their colleagues any facts that they may need.

To take sixty members of Congress, from all parts of the Union, out into the State of Minnesota, to pay their expenses for the entire trip, whether by rail or by canoe, is something which runs very rapidly into the thousands of dollars. Perhaps we may stamp as something less than visionary this interesting proposal when I say that it is already well within the bounds of likelihood that the funds for this large enterprise may be already reckoned as secured. Just how this will be done is something which I am at this writing not at liberty to disclose, but I may perhaps within the bounds of discretion say that if ultimate success shall crown the undertaking it will be due to the liberality of one of the biggest minded men the West has ever produced. So much for the news up to date of a matter which if left alone would not be worth writing about, but which, if handled as it seems likely it will be handled, may run into something very large and interesting indeed.

The State of Minnesota.

To many persons living in the East the State of Minnesota is simply a place out West. To many near-by dwellers, and even to most of the residents of the State itself, much of the original history of the State, and many interesting details regarding this northern part of the State, will come in the way of added knowledge. Really, there are few States more interesting, and few whose history holds more of wild romance. Here it was that stout and devout Lieut. Pike, honest Zebulon Pike, in the year 1805, came to spy out the new possessions of the United States, and to order the traders of the Northwest Fur Company to take down their British flags. Honest Zebulon accomplished his purposes, and told contemporary man much about the resources of that region, although he made the mistake of believing that Leech Lake was the headwaters of the Mississippi.

Prosaic, plodding Zebulon, what a good time he had without knowing it. Because, after he had come down the Mississippi River to St. Louis again, he was sent out into the West to the headwaters of the Arkansas River, with the purpose of crossing over to the headwaters of the Red River, thence descending that river and coming back home again to this great Mississippi River, which then marked the boundary of the known America. He got lost, did sober Zebulon, and by mistake struck the headwaters of the Rio del Norte, in Spanish territory. He was taken prisoner by the Spaniards, taken over to Santa Fe, and then was forced to ride with his captors horseback all the way to Chihuahua, in Old Mexico. Finally released, he rode again northward, through San Antonio, and across Texas far to the east, until finally, in the most matter-of-fact manner in the world, he came again to the Mississippi River, and to soil admittedly American. Meantime Lewis and Clarke were making their lucky trip to the Pacific Ocean, that wonderful trip which brought them so much glory, and which so far overshadowed honest, plodding Zebulon M. Pike, although the latter had seen much of new America himself.

The Historical Society of Minnesota has recently been digging in the early history of the State, and had discovered that Minnesota is the only State with a dual origin. As a matter of fact the territory of the State came partly from the Northwest Territory and partly from the Louisiana Purchase. Minnesota is the only State in the Union which combines territory of those two sources. Just to make my story more complete, and perhaps to please some citizens of Minnesota, I may quote from a paper

read by Mr. Samuel M. Davis, of Minneapolis, at a recent meeting of the Historical Society.

"It is not possible," the author said in part, "to divide among Benjamin Franklin, John Adams and John Jay the exact honor due to each for saving the Northwest to their country. To one, however, who goes through the original documents, it would seem that we are not least indebted to John Jay for his distinguished services in this connection.

"England's claim to the Northwestern territory was founded both on conquest and on the charters of the original colonies; and she was very reluctant to surrender so much of that region as remained in her hands at the close of the war.

Minnesota's Origin.

"The part of Minnesota east of the Mississippi River was taken from the original Northwestern territory. As afterward ascertained, its west line northward from the source of the Mississippi, in Lake Itasca, would pass through Beltrami county, by the west margin of Red Lake, to the Lake of the Woods. The territory east of the Mississippi and this line now included in Minnesota comprises about one-third of the State. The remainder of Minnesota as a Territory and State was derived from the Louisiana purchase.

"The interest that attaches to the Louisiana purchase is romantic as well as historic. That vast territory acquired by the United States in its early history laid the foundations for the subsequent greatness of the republic. That region had belonged successively to powerful and aggressive nations of Europe. Zealous and pious missionaries had traversed it. Daring and adventurous explorers and discoverers had plowed its rivers with their canoes and laid open the vastness of its extent and the magnificent wealth of its natural resources. At length it was returned to the dominion of France. Napoleon was at the head of the French nation, and was in need of funds to equip her armies for conquest. The United States stood ready to purchase Louisiana, and events hurried Napoleon to a conclusion."

Proceeding onward from the dates of acquisition of these great tracts, the first from Great Britain in 1783, and the second from France twenty years later, which supplied respectively the northeastern third and the western two-thirds of Minnesota, Mr. Davis reviewed, in the latter part of his paper, the successive changes of territorial organizations.

Wilderness Incurable.

Since the date of 1849, when Minnesota became a Territory, the changes have been too rapid to follow, yet in spite of the great development of the State there has always remained, virtually unchanged, a great tract of wild country in the upper part of the State, which has not been and which never can be reduced to the purposes of agricultural or city-building man. Hundred of square miles remain now covered with forests, in part virgin growth, though now largely ruined by the lumbering operations. The soil over the greater part of this section is so poor and sandy that it can never be farmed. A few little villages dot the wilderness here and there, dependent mostly upon the lumber companies. There is no permanent civilization, nor will there ever be after the forests are cut off. It is a country fit only to be a wilderness, but yet a country too noble to be merely a desolation. The time has come when, in the opinion of many thinking men, the desolation should be in part arrested, and the wilderness preserved.

It seeming desirable to place in available form as much information as possible regarding this region, a diligent study was made along all possible lines, and certain statistics were tabulated, this work being done on request by Mr. H. G. McCartney, of Chicago, a gentleman who has long been interested in the country lying about the headwaters of the Mississippi. To put this information into form readily digestible, I may say that the proposed forest reserve will include practically all of the four counties of Cass, Hubbard, Beltrami and Itasca. As stated above, the tract would be 140 by 125 miles, and would run from the southern line of Hubbard county clear to the Canadian border. This tract includes 4,000 lakes and countless streams. While it does not include the great White Earth Indian reservation, it does include six large and small Indian reservations, whose territory is already under the control of the United States Government. Under the control of the State of Minnesota is the State Park, which surrounds the headwaters of the Mississippi River.

Of the region thus embraced but little is known by the average man, and I know of but one other section in the Middle West of America equally wild and equally unknown, and that is the canebrake region of the Mississippi Delta, which latter is so rich it is being rapidly taken up by settlers. There does not lie out of doors a tract of country less suitable for agriculture or mining, or more suited to the uses of a national reserve than this sandy, piny Minnesota wilderness. This is not intended as a national park, properly speaking, but as a forest reserve only, and its establishment would not impair individual rights. Details regarding the extent, resources, population, etc., of this tract are given below.

1. The amount of land within the proposed park, which is included in the Indian Reservation, together with the number of Indians. The names of Indian reservations and number of acres and number of Indians:

	Number of Indians.	Acres.
Rois Fort	378	6 square miles.
Leech Lake	1,155	94,440
Red Lake	1,341	3,200,000
Cass Lake		320,000
Winnibigoshish	426	

Total

White Earth Reservation contains 36 square miles, with 1,322 Indians. This reservation would not be included in the Park. Total number of Indians in Minnesota, 7,280.

2. As near as can be concluded, the number of lakes within this region: Itasca county, 400; Cass county, 350; Hubbard county, 150; Beltrami county, 200; total 1,100.

3. The character of the soil in that region in Minnesota: Soil mostly of the drift period. A sandy loam, interspersed with sandy and rocky areas, fit only in most cases for tree growth.

4. The character of the timber and the probable amount of merchantable pine still standing:

Beltrami county is remarkable for its great extent, and the magnificent body of virgin pine forest, situated on the Red Lake Indian Reservation, southeast of the lake. Pine is also found on high ground all the way to the north boundary: White pine, 1-

500,000,000ft.; Norway pine, 350,000,000ft.; oak, maple, birch, spruce, poplar, tamarack, 250,000,000ft.; wood, 16,500,000 cords.

Cass county contains rich forests of pine and hardwood around Cass, Leach and Winnibigoshish. Land south of each lake to the width of ten miles has good clay and loam soil: White pine, 1,600,000,000ft.; Norway pine, 400,000ft.; oak, 8,000,000ft. ash, birch, basswood, elm, etc., 25,000,000; wood, 6,000,000 cords.

Character and amount of timber in Hubbard county: White pine, 450,000,000; Norway pine, 300,000,000; jack pine, 50,000,000; oak, 3,000,000; birch, 10,000,000; spruce, poplar, etc., 10,000,000; wood, 3,300,000 cords.

Character and amount of timber in Itasca county: White pine, 2,200,000,000; Norway pine, 550,000,000; jack pine, 30,000,000; cedar, 100,000,000; spruce, 100,000,000; tamarack, 50,000,000; birch, 100,000,000; oak, 50,000,000; basswood, maple, elm, ash, poplar, etc., 100,000,000; wood, 36,000,000 cords.

Itasca county has two important rivers, the Big Fork and Little Fork, Little Fork being the largest. The land traversed by these rivers covered with fine growth of timber, both hard and soft, and is good farming land. Much of the pine along these rivers has been stolen and floated down to the Lake of the Woods.

5. The number of villages or towns within the Park, and the inhabitants:

	Population.	Acres.
Itasca county.....	743	3,676,000
Beltrami county.....	312	1,431,000
Hubbard county.....	1,412	604,000
Cass county.....	1,247	1,768,000

Totals

Number of acres reserved: Itasca county, 586,014; Beltrami county, 1,088,000; Hubbard county, none; Cass county, 421,240; total, 2,095,254.

Population of towns in proposed park: Park Rapids, 277; Hubbard Village, 533; Grand Rapids, 415; Walker, 200; Bemidji, 150; Deer River, 50; total 1,625.

Character of unappropriated and unreserved land: Beltrami county—Prairie land and timber, hardwood.

Cass County—Timber, brush and swamp.

Hubbard county—Timber and prairie.

Itasca county—Largely timber; gold in the north, with light swamp; agricultural in the south; iron belt in center, running east and west.

6. As to the navigability of the Upper Mississippi for our light-draft steamers from St. Anthony Falls at Minneapolis to Grand Rapids: From St. Anthony Falls from Minneapolis to Brainerd, navigation is obstructed by rapids. Light-draft boats from Brainerd to Grand Rapids. Light-draft boats from Grand Rapids above the United States Government dam to Winnibigoshish dam; Winnibigoshish dam to Cass Lake.

7. The different kinds of game and fish in that region:

Birds—Woodcock, plover, prairie chickens, wild geese, quail, pheasant, wild ducks, all varieties; grouse, snipe.

Game—Elk, moose, caribou, deer, bear.

Fish—Muskallonge, great Northern pike, black bass, wall-eyed pike, pickerel, lake trout, whitefish, silver bass, croppies, rock bass, perch.

8. The market value of the land on an average, subject to the removal of the merchantable pine: In small lots, \$3 per acre; in large lots, \$1.50 per acre.

9. All the facts from Government reports and otherwise, bearing upon the management and cost to the Government of the Yellowstone National Park. The number of employees and the people under Government control, as well as the reports of officials having charge of the Park. About the number of forests through that Park, as well as to the extent of the Park itself: 62 miles long from north to south; 54 miles wide from east to west; contains 3,848 square miles; Park controlled by U. S. troops.

Sequoia and General Grant National Park: Sequoia Park, Tulare county, Cal.; contains 250 square miles. General Grant Park, Mariposa county, Cal., contains four square miles. Park is controlled by U. S. troops. Hot Springs reservation contains 900 acres.

The distinction between national parks and forest reservations: National parks special act of Congress; individual titles extinguished; private interests excluded. Forest reserves under a general act; no private holdings disturbed.

Itasca State Park: Amount of land owned and under State control, 10,879 acres. Private ownership, 8,823 acres. Park originally proposed by Mr. Albert J. Hill, in 1889. Seven miles north and south and five miles east and west.

10. Adirondacks Park under the control of the State of New York. State of New York owns 677,220 acres in the Adirondacks and 48,491 acres in the Catskills; a total of 725,711 acres, which has been set apart by law as a forest reserve. The management of these lands was vested in a State bureau, styled the Forest Commission; a board of five members to serve without pay. Under them a superintendent with assistants.

Private clubs own 550,000 acres; three of them own over 100,000 acres each, or a total of 390,000.

New York State has come owner of nearly 1,000,000 acres abandoned land by lumbermen because it was not worth the taxes.

11. Comparative statements from other countries, such as Germany, about their Government parks:

German Forest Administration—Average yearly new growth, 50 cubic feet per acre, or 2 3-10 cubic feet for 100 cubic feet standing timber. In Germany the prices of wood has increased in the last 30 to 40 years at the rate of 1 5-10 per cent. to nearly 3 per cent. per annum. In Prussia prices doubled from 1830 to 1865. From 1850 to 1891 it rose 59 per cent. From 1830 to 1879 net yield increased 1 36-100 per cent. per year. In Saxony from 1850 to 1879 at the rate of 3 2-10 per cent.

In the Bavarian forests at the rate of 3-14 per cent. per year. This will repeat itself in the United States.

12. What forest reservations the United States Government has provided for, and the manner in which the Government has taken control and is managing the same:

Report of the Secretary of the Interior—Forest Reservations by States.

Arizona—	
Grand Cañon.....	1,851,520
California—	
San Gabriel.....	555,520
Sierra	4,096,000
San Bernardino.....	737,280
Tabuco Cañon	49,920
Colorado—	
White River.....	1,198,080
Pike's Peak	184,320
Plum Creek.....	179,200
The South Platte.....	683,520
Battlement Mesa	858,240
New Mexico—	
The Pecos River.....	311,040
Oregon—	
Bull Run	142,080
Cascade Range	4,492,800
Ashland	18,560
Washington—	
The Pacific	967,680
Wyoming—	
Yellowstone National Park, timber reserve.....	1,239,040

Total amount of acres in above reservations.....

Lands actually reserved are only vacant, unappropriated public lands in said boundaries.

The number of these reservations is 16, and they are partially protected by the Government, by rangers or fire wardens.

Objects for making these reservations not defined by law, but are supposed to be protection against fire and axe, and also upon conditions of water flow, which are said to be dependent.

13. As to the effect of preserving the timber at the headwaters of our rivers in maintaining a volume of water therein as against a condition where timber has been cut off, it has been established beyond controversy that forest cover influences the regularity of water flow.

Forest floor prevents rapid evaporation, and tends to turn surface drainage into underground channels. Retards melting snow and thereby reduces spring floods.

Miscellaneous Notes.

Red Lake Reservation.—Arable land limited, but sufficient for the tribe; 95 miles wide and 115 miles long.

Secretary of the Interior recommends the sale of all timber on reservation at once to save loss by fire and wind.

White Earth Reservations contain 36 square miles of the best farming land in Minnesota. Ample in size and resources to accommodate all the Indians in Minnesota. White Earth Indians are self-supporting.

Area of timber land in the United States estimated, 500,000,000 acres.

Timber growing scarce, of the following kinds: White pine of the North, white ash, tulip poplar, and black walnut.

We consume 25,000,000,000 cubic feet of wood a year. Sixty years will exhaust our existing supply if there is no new growth.

Forest resources treated as a crop, rather than as a mine, from which we take what is useful and abandon the remainder.

White pine timber grown for market takes about 100 years.

Mayor Goes Snipe Shooting.

Hon. Carter H. Harrison, Mayor of Chicago, is a sportsman of no mean pretensions, which is to say, he is a sportsman of no pretensions whatever. The Harrison family came from Virginia to Kentucky, and from Kentucky to Chicago. It would be strange if the sportsmen's instinct did not show in it. Mayor Harrison is the second of his family to be Mayor of Chicago, and like his father is holding his second term of office. An ardent fly-fisher of wide experience, a bicyclist of thoroughgoing sort, and a sportsman tourist, Mayor Harrison is also a good wing shot, and now and then takes a day afield with the Louisiana quail of the Indiana jacksnipe. To-day he sent for me to ask where he could get some good snipe country, as he wanted to go out for a day before long. We both agreed upon the country near Lorenzo, on the Santa Fe road, where there is quite a section of marsh which is sometimes very good. Mayor Harrison will probably put up with Mr. Kelly, at his place on the banks of the Kankakee River, where, as Mr. George E. Cole and myself can both testify, the table groans, and the daughters of the family sing. I am sure I hope he will have very good fortune.

Snipe Situation.

Mr. E. H. Hughes, assistant passenger agent of the Grand Trunk Railway, in company with Warden Harry Loveday, of this city, and Fish Commissioner Nat H. Cohen, of Urbana, Ill., went snipe shooting day before yesterday, at Lottaville, near Valparaiso. They got there just a day too late, the birds having left, and they got but eleven jacks between them.

Mr. W. P. Mussey, who has been snipe shooting at Maksawba Club, has had bad luck the last two days he has been out, though earlier he got thirty and forty birds a day.

At Koutts, Ind., one of the best snipe marshes in the country, there have been some birds, though a great many shooters. Mr. Oswald Von Lengerke went to Koutts day before yesterday for a try at the jacks. At Shelby, Ind., or rather six miles north of there, there is a grand marsh, and this is a popular point. We are having very warm weather right now, and it may be the birds are moving out north, but if they are not leaving the entire section there should be shooting in the Fuller Island tract.

A shooter of Blue Island, a Chicago suburb, says that he has been finding quite a number of birds along the Sag, a few miles west of Blue Island, within the past few days.

Wake up.

Mr. R. R. Wiley, of Peoria, writes me as below:

"Allow me to congratulate you upon the success of your efforts in regard to the Senate bill 43. The stand that you and the other gentlemen so opportunely made should set an example to those who preach protection but who never do anything. If they would only wake up we might hope of having such improvements as 'no spring shooting' on the statutes."

Itasca State Park.

Among other good acts, the late Legislature of Minnesota appropriated \$20,000 for the enlargement and improvement of Itasca State Park, around the headwaters of the Mississippi River, which is, in the estimation of late Warden Fullerton, one of the greatest breeding places for game in the State.

The Executive.

The new executive agent of the Minnesota Commission, Mr. Beutner, is bestirring himself in his new duties. He has looked into the matter of licenses for Lake of the Woods, has held an auction sale of confiscated fish and game, and at last accounts had gone to Ely Lake, via Tower, for the purpose of collecting wall-eyed pike spawn.

E. HOUGH.

480 CANTON BUILDING, Chicago, Ill.

As to Flintlocks.

BALTIMORE, April 26.—*Editor Forest and Stream:* Noting "Snap Shots" in issue of 29th inst., and Mr. Orin Belknap's call for gun flints, do not, please underestimate the value of gun flint guns. My first gun was a "gun flint," and my affections go out to it as a companion that never failed me. In the early 40s my older brother had it changed to percussion, and when I returned from school I felt disposed to cry. The gun was a smooth-bore, and was carried by my grandfather in the battle at Lexington. The change from flint to percussion destroyed half its value as a family relic of the Revolution. I was a shooter at ten years of age, when I could not hold the gun at arms' length. That was early in the 30s. What would I have done if my percussion caps had become exhausted, or my cartridges—in the case of a breechloading gun. I lost a deer in Mississippi in 1843 because my percussion caps, carried in my breeches pockets, had become wet in my wading in the overflows. How I then wished for my old flint lock. It never missed fire. It sometimes "hung fire," but I would hold it as long as the powder in the "pan" burned, and it was sure to give a good account.

I don't see what people living remote from civilization want with breechloading guns or percussion guns. Where could they obtain supplies of percussion caps or shells, presuming they would load their own cartridges. That is where the flint lock gun comes in. My ideas may be old-fogy and tintured by my early education in firearms, but "thar I are." EDWIN S. YOUNG.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

One Ball, Two Ears, Two Holes.

ONE day last year while squirrel shooting in Essex county, N. Y., I rested for a few minutes on the sunny side of a hill overlooking Lake Champlain and the "Ti" Flats. There was an old man sitting among some bundles of corn, which he was husking in a lazy sort of fashion. We got to talking about hunting, and the old fellow said: "There was once a chap named Race Winters out in Schroon who had a hound that he shot a good deal by. Well, one day the dog was chasin' a deer through a pasture owned by a man named Wyman. Race hurried up so as to get a shot at the deer on the runway. Pretty soon he seed a big buck a-comin' full tilt right for him. He was jest goin' to shoot when somebody fired from a thicket near by, and the dog gave a yelp and fell. Race was so mad at the shootin' of his dog that he blazed away right into the center of the smoke about ten rods off. He heard a groan and felt that he had better get out of there pretty quick. Just then the old hound got up, shook himself and went on after the deer as if nothin' had

PIEGAN INDIAN BONE KNIFE.

happened. Race soon got to a cranberry marsh, but his partner, a city chap, had already shot the buck as it was druv in by the dog. The funny part of the story is comin'. There was two round holes through that hound's ears, fresh bored by a rifle ball as clean as a punch could have done it. Of course, the spunky old dog was all covered with blood—but he got over it all right. Winters told me once that a neighbor, who hated to have deer drove across his land, recovered from a flesh wound a few weeks later on, sayin' that he had shot himself by accident. I never heard of a neater single rifle shot than this borin' of a dog's ears while they was a-hangin' below his jaws." SILEX.

Ontario Quail.

LONDON, Ont., April 25.—*Editor Forest and Stream:* Quail have come through the winter in this section very well, if reliance can be placed upon reports. Our club has leased about 20,000 acres of land from the Government as a game preserve, upon which we have quail, partridges and woodcock. Reports from there are most encouraging, and we expect abundance of birds as usual next fall. Although this is a natural quail country, and it abounds with native birds, we are in the habit of putting out several hundred imported birds each spring, with the most gratifying results. We have succeeded in saving and putting out alive a very large percentage of the birds

INDIAN STONE KNIFE WITH WOODEN HANDLE.

which we imported in the winter, and in this way we have succeeded in keeping always an abundance of birds on our preserves notwithstanding that it is pretty heavily shot during the open seasons. I think every encouragement should be given to clubs who have preserves of this kind, and are willing to spend their money in keeping up a supply of birds, as we have done, as it benefits not only those who may be members of the club, but the birds scatter and help to keep up the supply on adjoining premises.

Our game laws here are very well observed. We have no spring shooting on ducks, and I would urge you to do all in your power to stop it in the United States. I belong to one of the best duck clubs in western Ontario, and we have very good shooting there, but would not if it were not for the strict observance of our rules for protecting the marsh and giving it regular rests. But it is somewhat discouraging that, while we on this side of the lake and river are doing all in our power to keep the ducks with us and give them every opportunity to increase, our American cousins in Michigan are shooting them ruthlessly in the spring; at least so I am informed on good authority. H. MARSHALL GRAYDON.

Spring Shooting.

MR. EDWIN TINSLEY, Chief Game Warden of Ontario, sends us this letter recently addressed by him to State Game Warden Chase H. Osborn, of Sault Ste. Marie, Mich. It has wider application than to the districts immediately concerned in Mr. Tinsley's references:

PARLIAMENT BUILDING, Toronto, April 22.—Mr. Osborn: I regret to learn that some of your good work in game protection in the State of Michigan is likely to be undone by the combined efforts of the unreasoning greed of pot-hunters and almost criminal apathy of sportsmen. We in Ontario have had to contend for some years with advocates of spring shooting who allege that we have been protecting the ducks for the sportsmen in New York State and Michigan. We had fondly hoped when

your Legislature abolished spring shooting that New York State would fall in line and that the shooting of wild fowl en route to their nesting grounds would soon be a thing of the past. I cannot understand what pleasure or enjoyment a man can derive from shooting game in the spring when unfit for food and full of eggs, men who do this and then expect to have a supply of young birds to shoot in the fall ought to be inmates of a government institution under medical surveillance. If any public officials of your State have any doubt of the wisdom of abolishing spring shooting let them cross Lake St. Clair by boat from Michigan to the marshes on the Canadian side during the summer months, and note the large number of the various species of wild game breeding unmolested, in striking contrast to the dearth of bird life in your waters. A public officer, no matter what his position may be, can confer no greater boon on the people of his State or country than by conserving and perpetuating for them the wise provisions of nature, whether of land or water, so bountifully provided. It is to be deplored that so few public men have the manliness and

courage to rise above political exigencies and honestly do what they know to be right, and just to God and their fellow-men.

Well, friend Osborn, you have done your duty, it rests with those in more exalted positions to do theirs. E. TINSLEY, Chief Game Warden.

North Carolina Quail.

Editor Forest and Stream:

I notice that much has been written through the columns of your valuable paper about the destruction of game birds by the extreme cold weather of February last. I have made diligent inquiry in this section about the matter, and while there is no doubt that they suffered a great deal from cold and hunger, I have every reason to believe that but very few succumbed. When I say "game birds," I refer to quail of course, as they are about the only really game birds that we have here, and I have only heard of three being found dead.

I know that great numbers of doves, larks, yellow-hammers and smaller birds did freeze to death, for I found many of them myself.

I only took one hunt after the cold wave, and on the trip found twenty-four fine coveys, and out of sixty-eight bagged only found one bird that was poor.

Several weeks ago I had occasion to go about nine

miles in the country, and in going that distance I saw five very fine coveys along the roadside. From what I have seen since the shooting season closed, I should say that there was more than enough left for breeding purposes, and with a favorable season I think that we will have a great abundance of quail for our next fall's shooting.

The worst enemy that we have to game here is the "pot-hunter," who goes out with only one idea, and that is to get birds, no matter how. They are after meat and not sport.

May the day soon come when no man will be allowed to sell game. C. H. HARRIS.

ROCKY MOUNT, N. C.

Newfound Lake.

NEWFOUND LAKE, Bristol, N. H., April 29.—The fishing season at this noted lake will open in a few days, as the ice is commencing to honeycomb. Sure sign that dissolution will soon take place.

The season promises to open lively, with all boats engaged, as already there are a few fishermen from Boston now at the lake shores waiting and hoping for the honor of landing the first landlocked salmon this year. If the fishing opens as good as it was the first few days of last year, many a nice trout or salmon will grace the tables of anglers' friends in Boston or New York.

This lake is restocked every year from the State hatchery, located on its banks, which now contain fry in tanks for future distribution in lakes and streams of New Hampshire: 1,000,000 lake trout, 60,000 landlocked salmon, 125,000 brook trout.

Newfound Lake is fed by numerous cold springs. Trout and salmon are often caught during the summer months by deep trolling.

LANDLOCKED SALMON HOUSE.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Sea and River Fishing.

The Mascalonge.

NATURE must have been in an ugly mood when she formed the ancestral pike and launched it in the fresh waters upon its mission of destruction. Thoreau has described the pike as "the swiftest, wariest, and most ravenous of fishes, which Josselyn calls the river wolf." An English writer says: "The European pike, like its brethren, is the most voracious of fresh-water fishes; it probably exceeds the shark, to which it has been compared by many writers, in the relative quantity of food it consumes. Ponds would soon be depopulated, but for its cannibal propensities, no pike being safe from another of its own kind large enough to swallow it." Hallock refers to the mascalonge as "a long, slim, strong and swift fish, in every way formed for the life it leads, that of a dauntless marauder."

But what has the mascalonge to do with the pike? It belongs to the same family, and even the same genus. The pike family is a small one, containing only five principal members. In this family the pickerels are the small fry, the pike comes next in size, standing in a group all alone, and in some waters, rivalling in proportions the giants of the aggregation, the formidable mascalonges. In Europe pike weighing from 40 to 50 lbs. are not uncommon, and captures of much larger ones have been reported.

What are the races of mascalonge? There are three: The common form of the Great Lakes and the St. Lawrence River, with the upper part of the body usually gray, the lower part pale, the sides and fins with numerous roundish dark spots, about as large as buckshot; the banded mascalonge of Chautauqua Lake, New York, which has no dark spots, but has many irregular dark cross bands, intermingled with broken bands and blotches, and the variety in lakes of Wisconsin and Minnesota, which lacks both spots and bands, and has uniform bluish gray sides. The last is the one described by General Garrard, under the name *Esox immaculatus*, from eagle waters.

The writer is at a loss to know how to regard the

Nat. Size.

MASCALONGE 4 DAYS OLD FROM CHAUTAUQUA, LAKE, N. Y.

mascalonge of the Ohio River, and its tributaries since authorities differ as to its relations. Kirtland described it as: "White with many narrow transversal brown bands, somewhat curved; length, 5 ft." Jordan and Evermann in "A Check-List of the Fishes," etc., 1896, place the Chautauqua Lake variety along with the unspotted mascalonge of Wisconsin and Minnesota; but in Bulletin 47, U. S. National Museum, published nearly two months earlier, the Chautauqua Lake specimens are supposed "to be allied to the typical form *masquimongy* rather than to var. *immaculatus*, but are somewhat different from either in coloration. No constant difference in other respects is apparent."

The three forms of mascalonge have been defined as follows:

(1) A typical mascalonge, the sides with round or squarish, blackish spots of varying size on a ground color of grayish silvery, the belly white, the fins spotted with black. (In the Great Lakes, their outlets and tributaries.)

(2) A form with spots coalescing in bands. (In Ohio River, Chautauqua Lake, Conneaut Lake and other clear lakes outside the Great Lakes system.)

(3) A variety, or subspecies, with spots obsolete, but with vague, dark cross shades, the tail a little more slender and fins a little higher than in the spotted, or lake, mascalonge. (This in lakes and rivers of Wisconsin and Minnesota.)

The great difficulty with these varieties is to keep them where they are supposed to belong, and induce them to maintain at all times the characters assigned to them. They have an unfortunate way of growing out of one style and into another, and mixing things up by swimming away from one jurisdiction into another. To illustrate: The Ironton Register, Ironton, Ohio, Nov. 28, 1895, had an account of a "pike" taken on light bass tackle by James Dupuy in Tygart's Creek, a tributary of the Ohio River. The fish was 44½ in. long and weighed 31 lbs. Mr. E. Hough wrote about that fish in FOREST AND STREAM, July 11, 1896, as follows: "The head was spotted with dark, regular, exactly round black spots on the jaws and gill-covers. Mr. Dupuy said that the entire body had these regular black spots all over it, a trifle larger than the end of a lead pencil." The writer saw the head of that specimen at FOREST AND STREAM office, July 29, 1896, at which time the black spots of the head were present, but scarcely visible. The head was 9 in. long.

Now, if the mascalonge described by Mr. Dupuy, Mr. Hough and myself be a black-spotted fish without cross bands, it is not the same as Dr. Kirtland's mascalonge, and the Ohio basin must be credited with two races instead of one. Dr. Henshall has contributed to the history of color variation with age in the following paragraph:

"It was also supposed that in all cases the mascalonge was always dark-spotted on a lighter colored ground, but as already stated, while the young are always thus marked, these dark spots become more or less obscure or obsolete with age, and the largest specimens will exhibit a uniform grayish coloration, with brownish or greenish reflections. I have seen large examples from the St. Lawrence basin that were apparently identical in color with others from Eagle Waters and the upper Mississippi of similar size and weight."

The best account of the mascalonge in Wisconsin waters is given by Mr. A. A. Mosher. He says there are three varieties, the unspotted, barred and spotted, and describes them as follows:

"The 'barred lunge' agrees in coloration with the

variety in Chautauqua Lake. On the 'barred lunge' the bars are transverse and commence near the back and extend to the edge of the belly, that is to say, some of them do, while others go only part way, being quite irregular all over the sides, without any apparent system; the dorsal fin is marked the same.

"In the spotted variety the spots are also irregularly placed, and the intervening space partially filled by transverse bars, the dorsal fin marked with distinctive round black spots, exactly the same as in the common gar.

"The '*Esox immaculatus*' has no distinctive mark, the back being dark green, which color extends down the sides, fading, as it extends downward, into a greenish yellow, where it blends with the white on the belly.

"These distinctive marks are on the barred and spotted specimens when very small, not over 2 or 3 in. long, which shows that they are different in marking, at least, from the moment of leaving the egg or nearly so.

"These three varieties are found together, and in fish-

The name *mascalonge*, or *maskinongé*, appears to signify "deformed pike" or "spotted pike"; but we may never know the original orthography and meaning of the designation first applied to the fish. Mr. Chambers, in his book of "The Ouananiche," says:

"The original spelling of the Indian name was undoubtedly 'maskinongé,' and such it is still called in the statutes of Canada. According to Bishop Lafleche, of Three Rivers, a recognized authority upon Indian customs and dialects, and in his early life a devoted missionary to the Northwest, 'maskinongé' is derived from *maské* (deformed) and *kinoje* (a pike), and was applied to the *Esox nobilior* by the Indians, because it appeared to them a deformed or different kind of pike from that to which they had been accustomed."

Dr. De Kay, in the Zoology of New York, Fishes, 1842, mentions it as: "The *muskellunge* or *maskinonge*, for its orthography is not settled. * * * According to Le Sueur, the name of this fish in the Wyandot dialect is

palate almost as long. On the tongue will be found a long patch of fine teeth, beginning in a sharp point and wide at the hind margin. The gills bristle in front with numerous clusters of short, spiny tubercles. Many of the teeth are depressible, facilitating the capture of the prey and preventing its escape. The eye is silvery white with a tinge of yellow, and it has a cold, calculating and ferocious aspect. The combination of great size, enormous strength and formidable dentition makes the *mascalonge* easily one of the most dangerous of the predaceous fishes of our fresh waters.

No hint of the ferocity and destructive character of the adult *mascalonge* is conveyed in the appearance of the newly hatched young, here represented for the first time, and upon an enlarged scale, the actual length of the embryo four days after hatching being not quite 1/2 in. The specimen illustrated was one of a series preserved at Chautauqua Lake by Mr. Frank Redband, foreman of the Caledonia Fish Hatchery. It would require a lively exercise

THE MASCALONGE.

ing for them one is as likely to catch one kind as another. In size and proportions there is no perceptible difference in the three, and in the spring, while they are spawning, they are found together at the same time and place, which would go to show that they are really of one family, for the spotted male is as likely to be found with a barred female as with a spotted one, or with an '*Esox immaculatus*,' so called. * * *

"It may be that away back in the past during some very high waters some of the St. Lawrence variety got over into the Mississippi waters, and mating with '*Esox immaculatus*' produced a hybrid in the spotted and barred *mascalonge*, and that nature, for some inscrutable reason, has kept up these markings in different individuals."

Even in Chautauqua Lake, according to Mr. James Annin, Jr., color variation with age has been observed. Mr. Annin writes that Mr. Frank Redband, foreman of the Caledonia Hatchery, is familiar with the *mascalonge* during the spawning season only. He says all the large fish, above 25 lbs., are spotted (meaning banded). If there

Thuhahwesah han." It must be remembered, however, that Richardson regarded Le Sueur's description of a supposed *mascalonge* as applying to the pike, and not at all to the *mascalonge*. The name *maskinongé* or *maskinongy*, was published in the Mirror by Dr. Mitchell in 1824. In 1815 De Witt Clinton knew the fish as the *muscalinga*, and his account, in the first volume of the Transactions of the Literary and Philosophical Society of New York, published that year, is as follows: "The *muscalinga*, a species of pike, is greatly esteemed, and is generally caught in rivers emptying into the lakes. It weighs from 10 to 40 lbs., and in a few instances 45 lbs., and is generally very fat."

Rev. Zadock Thompson, just fifty years ago, described the *mascalonge* from specimens taken in the River La Moille, Vermont. It was then called by the fishermen the *masquallonge*, and Thompson defined it thus: "The vulgar name *masquallonge* appears to have been given by the early French settlers of Canada to the pikes and pickerels generally, it being a term or phrase descriptive of the

of the imagination to forecast this puny little creature in the rôle of a "dauntless marauder" or a "mere machine for the assimilation of other organisms," and yet, potentially, "he is it."

The egg of the Chautauqua Lake *mascalonge* is about 1-1 1/2 in. in diameter, and 74,000 of them will fill a quart measure. The eggs are free, semi-buoyant, and not adhesive, although some writers say they are slightly adhesive and stick to water plants. In a fish weighing 39 1/2 lbs. the ovaries weighed 5 lbs. and a 35 lb. fish has furnished 265,000 ripe eggs. Spawning usually begins in April or May, soon after the lake is free from ice, and the season is short. It occurs in depths of 10 to 15 ft. on the mud in the bays, or among rushes and grasses near the banks of streams. The eggs have usually been hatched in boxes with wire-cloth tops and bottoms, submerged from 1 to 4 ft. below the surface, the boxes being drawn up daily, the covers taken off and all sediment and dead eggs removed. In 1898 Mr. Annin experimented with the eggs in Chase hatching jars, each containing about

THE UNSPOTTED MASCALONGE.

be any difference in the *mascalonge* at the spawning season the men did not notice it.

About May 1, 1898, Mr. Annin and Mr. Cheney inspected about 130 *mascalonge* at Chautauqua Lake, and in all that number did not find one of the spotted ones, that is, with round spots covering the entire fish, or anything like the *mascalonge* of the St. Lawrence. A good many of them were spotted near the tail, but on their sides they were all barred. One of the very large fish had neither bars nor spots, but seemed to be all of a brownish cast.

From the foregoing somewhat elaborate details we are forced to the conclusion that no one of the three races of *mascalonge* is restricted to a single locality, but two or more of them may occur at any time, and anywhere within the known limits of distribution.

In Chautauqua Lake, New York, it is stated, the dark transverse bars on the sides are characteristic of young fish, and, in the female especially, they disappear at an early age. It is said, further, that the sexes are represented there in the proportion of four males to one female. So-called *mascalonge* are reported in several of the inland lakes of New York, but it is doubtful whether they belong to that species.

The pike was so called on account of its long, slender shape and pointed snout. The pickerel is a little pike.

whole family—*Masque* signifying face or visage, and *allonge*, lengthened, they all having lengthened or elongated heads. In modern times this name, *masquallonge*, has been confined by the fishermen to the species here described, while the other species bear the vulgar name of pike or pickerel. * * *

In his description of the *mascalonge*, Mr. Thompson first called attention to the most important superficial character by which it is distinguished from the pike and pickerels, namely, the absence of scales on the lower half of the cheek.

According to General I. Garrard (see FOREST AND STREAM, Vol. XXVII, p. 268) the unspotted *mascalonge* is *Osh-au-wash-ko Genozhay* of the Chippewas, or blue pike. It is not proposed to discuss further the origin and etymology of the name, since these matters have already been extensively treated in this journal.

The savage character of the *mascalonge* will be revealed through a glance at the size of the mouth and the structure of the teeth. The long jaws are armed with bands of strong, sharp, curved teeth, which might as well be called fangs. The middle of the roof of the mouth bears a patch of teeth nearly one-third as long as the head, and this is flanked on each side by a band on the

four quarts. Apparently they worked as easily as white-fish eggs, but after hatching they seemed to be too weak to rise and go out of the jar into the receiver. The same difficulty has been experienced with certain trout eggs, but by transferring the embryos to rearing boxes or troughs the trouble was overcome. The *mascalonge* eggs usually hatch in fifteen or sixteen days, when the water temperature is 55 degrees Fahrenheit, and the yolk-sac is absorbed in the same length of time. The fry are always helpless when first hatched, but especially so when the hatching period is protracted. At Chautauqua Lake in 1898, according to Mr. Annin, eggs hatched during the first week in May had been in the boxes over thirty days.

The spawning fish are captured in nets, which are set as soon after April 1 as the ice leaves the lake, and the season usually closes in the latter part of April. Males are much more abundant than females on the spawning grounds.

Mascalonge are not gregarious, but are often caught in pairs after the spawning season has passed. They are, for the most part, surface feeders, or they will be found along shallow bars where aquatic plants grow nearly to the top of the water. Their food sometimes consists of vegetable substances, but usually of smaller fishes without regard even to their own offspring. They frequently conceal themselves under lily pads and lie in wait for their prey.

* In the Rapport sur les missions du diocèse de Québec, No. 12, April, 1857, p. 102.

upon which they dart swiftly by a single stroke of the powerful tail. Fishes and young waterbirds are destroyed by them in great numbers, and still more victims would fall before their voracious appetite, but for the huge and somewhat unwieldy bulk of the pursuer. In Chautauqua Lake the mascalonge frequents nearly the same feeding grounds in summer and winter, and is always found in or near water weeds. In February, when the water becomes very clear, the fish range into greater depths; in fact they prefer the depths for permanent quarters, except at spawning time. They are said to feed freely after sundown, and on bright moonlight nights. Warm water appears to have an enervating effect upon them, but when the nights are crisp and cold, as in October and November, they are particularly active and vigorous.

De Witt Clinton wrote to Mitchell of the "muscalinga" as a species of pike which is greatly esteemed. Dr. Kirtland considered the fish one of the best for eating produced by the western waters. Rev. Zadock Thompson described the Vermont "masquallonge" under the specific name *nobilior*, "believing it to attain to a larger size and to be a more excellent fish for the table than any other species of the pike family found in the United States. It is a fish which is eagerly sought, and commands the highest price in market." Mr. James Annin, Jr., stated to me that he had never tasted a mascalonge, or any of the pike family, from other waters that would compare favorably with the Chautauqua Lake mascalonge. The writer cannot claim much experience with the mascalonge as a food fish. While at Trout Lake, Wisconsin, in 1893, we had it on the table of a U. S. Fish Commission car. The flesh was tough and stringy, and poor in flavor; but the weather was warm and something may have gone wrong in the cooking. The finest fish of the pike family, in my judgment, is the little banded pickerel, which is found in its best condition in streams of Long Island, whose lower waters become brackish on flood tide. It is almost free from small bones, the flesh is firm, and the flavor is exquisite, and especially so in October.

The mascalonge has not the dash and activity of the bass, nor the impetuous rush of the salmon and trout; it may nibble at live bait, play with it, and leave it instantly when alarmed by a suspicious movement or an unnatural appearance of the lure. It does not always strike with the regularity and frequency so much desired by the patient angler, and, even when it takes the bait, it must be allowed to hook itself as a rule. Sometimes it will strike with a rush and leap out of the water when hooked, shaking its head fiercely to remove the hook, and again, it may sulk at the bottom as persistently as a salmon, or it may give slack line faster than the reel can take it up. In summer the mascalonge loses its vigor to a large extent, strikes the live bait or trolling spoon with little energy, and offers only slight resistance when hooked; but in October and November, when the nights are crisp with frost, it fights vigorously, especially after sundown and on bright moonlight nights.

Owing to its habit of lying in wait for its prey, the mascalonge is usually caught by trolling with hand line or rod and line near the reeds or lily pads in which it is concealed. A moderately stiff rod, $8\frac{1}{2}$ or 9 ft. long, and weighing 8 to 10 oz., with about 300 ft. of No. 9 Cuttyhunk line, and spoons of the sizes 7 and 8, meet the usual requirements of mascalonge anglers. A live chub of good size, a sucker or a frog will be found suitable for bait, and one of these may be used effectively in combination with a spinner. With about 50 ft. of line out the cast should be made as close as possible to the edge of the reeds or lily pads, the boatman rowing along about 20 ft. from the edge. It is important to let the fish hook itself, and to play it until it is completely tired out. When the fish leaps out of water the tip of the rod must be lowered and the rod held parallel with the surface of the water, to prevent the huge body from falling on the line, and to keep the hook firmly set. The line is to be kept taut, holding the fish on the spring of the rod.

When the gaff is to be used, insert it securely back of the gills and bring the fish aboard with a strong and quick motion, unless you prefer to kill it in the water with a stout club or by shooting it in the head. It is extremely risky to attempt to handle the mascalonge, even when apparently exhausted, instances being on record of severe injuries inflicted by the fish upon the hands of unsuspecting fishermen, when placed in the water in front of its jaws.

For trolling astern, 150 ft. of fine silk line may be used where the fish are not very large. When the fish is hooked it is best to row out into deep water, where line can be freely given without danger of fouling in the weeds. In the lake region about Georgian Bay a small spoon with two blades and two swivels is often used.

In central Ontario, the lakes and connecting rivers from Kingston, on Lake Ontario, to Georgian Bay, covering more than 300 miles, mascalonge and black bass are still abundant. Stony Lake offers celebrated ground. Lake Cameron and its tributary, Balsam River, are well-known mascalonge waters. Lindsay and Peterboro are noted headquarters for the fishing. From Lindsay parties go out to Sturgeon Lake, Bobcaygeon, and Fenelon Falls. In the rapids of the Balsam, formed below a low log slide, big fish live and thrive. In this region minnows, green frogs and crawfish are used for bait.

In the pine woods region of upper Michigan and Wisconsin there are series of lakes and connecting streams extending for hundreds of miles. "Below the low range of hills called the Iron Divide the streams flow to the Mississippi, the chief rivers being the Wisconsin, Flambeau and Chippewa. The Manitowish waters are tributary to the main branch of the Chippewa, and from these are separated by a low divide the Turtle waters. Each of these is a connected series of lakes, the streams uniting them being in many cases mere sluggish creeks called 'thoroughfares.' The mascalonge is found in all these lakes and streams which are tributary to the Mississippi."

Chautauqua Lake, New York, and Conneaut Lake, Pennsylvania, especially the former, are famous for their mascalonge and for the superior qualities of the fish as game and food. On account of its size and the esteem in which it is held, the fish has steadily diminished in numbers with the increase of population, but with the aid of protective legislation and artificial reproduction it may long continue as a distinguished member of the society of American game fishes.

TARLETON H. BEAN.

CHICAGO AND THE WEST.

Chicago Fly-Casting Club.

Mr. H. G. Hascall, captain of the Chicago Fly-Casting Club, issues the following card:

"The regular contests of this club will be held during the summer of 1899 at the North Lagoon in Garfield Park, upon the following Saturday afternoons:

"May 13 and 27, June 10 and 24, July 22, Aug. 5 and 19, Sept. 2, with extra contests for re-entries upon July 8 and Sept. 16.

"Entries for any one of the four events will be received up to the time the last man is at the score in each event. Late arrivals will be allowed to cast in each event after all the contests are finished.

"The time for calling the events shall be as follows: Long distance fly, 1:30; distance and accuracy fly, 3; bait and dry fly, 4. The captain to state which of the latter shall be called first."

The secretary of the Chicago Fly-Casting Club is Mr. George Murrell, room 2, 161 La Salle street, Chicago.

A Good Rule.

It was at Kabekona Camp, in Minnesota, that the rule was first established among the guests of the resort that all fish above the legal daily limit, or above the amount which could be readily used by the taker, must be returned alive to the water. In practically all cases this rule was cheerfully complied with. I am glad to see that a resort at State Line, Wis., follows suit by publishing this also as a rule of their establishment. It is a good rule, and should be followed by all summer hotels.

Trout.

Mr. Charles Antoine, of Von Longerke & Antoine, of this city, will start within the week for the Prairie River of Wisconsin. He will be accompanied by Mr. Edward Taylor, originator of the "Taylor system," of which we have heard so much.

Bass.

The weather is bright and warm here now, and the trees and grass show all the marks of advancing springtime, yet this change has been a sudden one, and the season, so far as fishing is concerned, is fully two weeks late. At St. Charles, on the Fox River, suckers are running and some pickerel are taken now and then, but hardly a bass has been seen, or at least had not a few days ago. By the almanac it is time the sucker run was over and the bass should be up in force. I should expect to hear of the bass run at that point within a week at latest.

Speaking of bass, and speaking of St. Charles, reminds me that I was once told by Ed. Rock, a local fisherman, that he has very often seen both bass and pickerel go up over the fishway at that point. He has seen them nearly succeed in going up over a sheer fall of water at the dam, at one side of the fishway, where the water drops nearly 10 ft. straight down or with but little pitch. Many men think that bass will not ascend a fishway, as I remember was the assertion of Mr. Avery, of Port Huron, at Lansing, Mich., last winter.

Trout Time.

It is getting very close to trout time now. I should not be surprised, from all I hear, if the trout season in Wisconsin were relatively more advanced than the bass season here. The middle of May will be late enough and the first of May will do.

The best time in the year to take big trout on the fly is just at "the turn," when with a leap winter changes into summer in the pine woods. At that time the big fish are moving and they are less wary than they will be soon after the streams begin to be whipped and plugged by fishermen of all sorts.

E. HOUGH.

480 CAXTON BUILDING, Chicago, Ill.

New England Early Fishing.

BOSTON, April 29.—The movement of sportsmen toward Sebago Lake for landlocked salmon fishing is a fairly good one, though the ice was eighteen days later than last year in getting out. Reports say that the fishing is to be good, though up to this writing there are no accounts of big catches. The Sebago Club party is off for their beautiful location near the mouth of Northwest River, but the numbers are a little reduced by the fact that the ice was so long in getting out, putting members into other engagements. In the party are Henry S. Fisher, manager of the excursion, and pioneer of the Sebago Club; W. T. Farley, S. A. Bolster, C. A. Dean and two or three others. The party really carries considerable weight, as Mr. Bolster is judge of the Roxbury Municipal Court, while Mr. Dean is one of the most successful of Florida tarpon fishermen. Mr. Farley has a reputation of a 6 lb. trout at the Rangeleys. Messrs. Brackett and Clark are also about starting for Sebago for salmon. I use their names together because they have fished together so many seasons that among fishermen, especially at the Rangeleys, they are always named together as a firm. Later they will go to the Upper Dam, at which point they have fished for a great many spring trips. Mr. Kendrick is also getting ready for Sebago. Mr. L. Dana Chapman, secretary and treasurer of the Megantic Club, with W. K. Moody and Mr. Jones, editor of the New England Sportsman, are off for Sebago. Mr. Chapman has fished there for a number of seasons. He has his son, a youth of twelve, with sporting proclivities, with him on this trip, and he is expected to take a big salmon. They go to Fitches, near the Northwest River, and will doubtless fish the mouth of the Songo and Muddy River besides.

Later a Portland dispatch says that thirty salmon were taken at Sebago Friday. Mr. Pinkham, of Portland, took one of 18 lbs.

EAST SEBAGO, Me., May 1.—This is a queer little town, four miles through the pine woods from Mattock's Station, on the M. O. R. R., and on the southeasterly shore of Sebago Lake. It is here that a good many landlocked salmon fishermen gather in the springtime, while there have sprung up a number of ideal camps, to which tired

Boston and Portland fishermen resort as often as business will permit during the summer and autumn. Fish and Game Commissioners Carleton, Stanley and Oak, with Supt. of Hatcheries Carr, were here yesterday. I understand that they did not fish at all, there being some ice still left in parts of the lake, and the new law reading, "When the ice is out." Evidently the Legislature did not make the law plain enough. But others are fishing. A young man by the name of Field took a salmon Saturday weighing 17 lbs. Mr. W. D. Brackett, of the Brackett and Clark party, took three salmon the same day, one of 3 lbs., one of $5\frac{1}{2}$ lbs. and one of 8 lbs. A party of sportsmen, some from Boston and Portland, is at the Anco-cisco Club. Frank Ferdinand, of Roxbury, is in the party. They came in Friday night. I have not yet heard of their success with salmon. A number of Portland sportsmen have gone up to the Sanyo River.

SPECIAL.

The Moosehead Signs.

MOOSEHEAD LAKE, Maine, April 25.—*Editor Forest and Stream:* Tell the boys through your columns that they can begin to overhaul their fishing kits and look after the old tried rod, for the time approaches when there will be fun to be had with our big speckled trout and lusty lakers! The black ice is already up, and if the extreme warm weather of the past week holds for a day or two yet, it will so honeycomb the ice that the first hard gale will break it up, and fishing will be in order. From present indications I venture to predict that the ice will be out by May 8.

I go fishing with a great many parties each season, and notice that many gentlemen who come here do not use large enough hooks when bait-fishing—that is, trolling with live minnows. We have lots of trout of 3 lbs. weight in Moosehead, and even as large as 6 lbs. have been taken, and when one of those fellows strikes a light hook, away it goes, and the fish is lost. Then, too, many of the rods brought here are too light and springy. In order to hook a fish securely a good weight, stiff rod should be used, and it should not be too long. Our earliest fishing is done by trolling with from 60 to 80 ft. of line, and it needs a fairly stiff rod to set the hook well home when striking the fish. Our lakers, or lake trout, weigh as much as 30 lbs., and when one of that size catches on, he means business, and it needs good tackle to hold him.

These remarks are intended for those who have never fished Moosehead Lake, many such coming here each year for the first time. Of course, the oldtimers and those who are familiar with our waters, know what they are at and come with proper outfits.

I know the boys are all longing to try the trout, and impatiently waiting for the season to open here. The fever is in the blood of all good fellows, and I even got a spasm myself, so I worked it off with poetry flatus—I believe that's what a regular poetry feller I was with two years ago, called it. He used to set by a brook and "listen to the water talk," as he said, instead of fishing. When the "flatus" hit me I was setting by my camp-fire looking at the moon, and wondering why it took so long for spring to get into the backwoods. Here's how it struck me:

The snowdrifts, they are a-goin',
An' the brooks they are a-flowin',
An' the fish-worm is crawlin' in the ground;
On the lake the ice is thawin',
In the woods the crow is cawin',
An' the trout fishin' season's comin' 'round;
An' my blood it is a-b'illin',
Fer a tussel I'm a-sp'illin',
At the big trout I must surely have a go.
"With my rods and reels an' traces,"
I'm a-goin' ter try the places,
Where the biggest fish of all are lyin' low!
Ev'ry day the sun gets higher,
Gettin' warm as my camp-fire,
Soon the papers they will say, "the ice is out";
Then I'll grab my old bamboo,
An' a-killin' fly or two,
An' be off to Moosehead Lake to try the trout!

ED HARLOW, Registered Guide No. 92.

Pennsylvania Troutng.

A FEW days of the last week in April spent at the Spruce Cabin Inn, Canadensis, Pa., afforded the writer the opportunity of again taking up his fly-rod, which had been laid aside for two years on account of the cares of business. The weather was bright and beautiful, the country charming, the trees just beginning to leaf, and the water clear as crystal. The Broadhead and tributary streams had run down low from the absence of rain for several weeks, making the trout shy.

Careful fishing, however, gave satisfactory results at times. I caught enough fish to eat while there, and nine nice ones to bring home. They ran up to 12 in., and were in fine condition. Seasonable showers are needed to insure good catches. My outing was altogether pleasant.

Foxhounds and Foxes.

Now that New England fox hunters have Reynard "started," I hope they will let their "trigger finger" play with the pen and narrate their hunts in *FOREST AND STREAM*. The article under the heading of "New Hampshire Fox Hunting," by C. M. Stark, that recently appeared, plainly stamps him as an experienced fox hunter, and one who has studied out the successful ways of pursuit. In your last issue I recognized an old acquaintance in Dr. E. H. Niles, and was surprised he had joined the crowd of "lazy, shiftless fox hunters." He, too, has discovered the health-giving sport fox hunting abounds in. Fox hunting has grown in favor for the past few years, and is the foremost sport in many sections. That unique figure, the old fox hunter of twenty-five years ago, who could be found in nearly every neighborhood, has gone, together with his hound.

During the past year my experiences have shown that good foxhounds are scarce. My brother and I commenced during the last week in September to purchase a foxhound, and not until the last week in January did we buy; and then we purchased a young dog that had been hunted on rabbits for two years. Over one hundred had been killed ahead of time; but he formed a habit of starting foxes, and so was condemned as a rabbit dog. Nothing now will induce him to run rabbits. He has a wonderful nose, is a fast, wide ranger, and foxes run well before him.

I would advise everyone to take a dog on trial before purchasing. We had six dogs on trial, at prices ranging from \$5 to \$35. Nearly all came highly recommended. None of these dogs would we take as a gift. However, the \$5 dog proved the best. He caught a fox in a manner similar to that described by Mr. Stark. We saw the fox cross a field and enter the timber with the hound some fifty rods behind. In a short time we heard the dog baying as if the game had holed. On going to the dog we found he had caught and was barking at, not having the courage to kill it. Nor could the fox get away. This fox was not injured in any way, and the trailing was on bare ground. This would have remained a mystery, as did Mr. Stark's hunt, had I not had a similar experience a few years ago, which occurred in sight. I saw the hound start a fox from under some shelving ledges in the open pasture. The fox ran some fifty rods, coming within twenty rods of my stand, when it stopped and bristled up, with its ears lying flat on its head (much like a cat on the approach of a dog), and stood waiting for the dog. The hound trailed up within a few feet of the fox, but had not the courage to kill it. After a moment the fox trotted away, the dog in pursuit. I saw the fox several times during the next hour. The hound was always twenty or more rods behind. At another time I had a fox get out from its inclosure during the night. The hound was put on the trail and soon started it, running to a large field, when the hound was not more than four rods behind, when, quick as a flash, the fox turned and tackled the dog. The dog threw the fox and held until taken away uninjured. This may explain why at times a fox is caught by a hound when the chances of escape are easy.

BARRE, Vt.

Yachting.

ONE of the curious developments of modern yachting is the conversion of old schooners into serviceable auxiliaries. This was begun a couple of years ago by Rear-Com. Whitlock, Atlantic Y. C., who converted the famous old schooner *Hildegard*, once owned by the Prince of Wales, into an auxiliary, with good success. Now Mr. Whitlock has taken the old *Ramona* for the same purpose, while *Palmer* and *Viking* are also in hand for similar change. The idea is a very good one, the boats are still sound and staunch and of course roomy, while they have that bold shipshape appearance which should be an essential quality of every yacht. With but a moderate loss of space for the power, they can be driven at a fair service speed, and by dint of sail and power together they can get around very well with the fleet of newer boats.

AFTER enduring impatience for many months such abuse, insult and misrepresentation as, we are happy to say, but one American paper is capable of, the Yacht Racing Association of Massachusetts has at last taken public notice of an evil which is apparently beyond remedy. Mr. Higginson, the president, and Mr. Walter Burgess, of the executive committee have each written to protest against the malicious attacks made on it. It is strange that a paper which claims to be of high standing should lend itself as a mere instrument of personal spite against prominent yacht clubs, as in this special case and many others.

WITHIN the past week there has come sad news for the "born sportsmen" of the Payne and Frye stripe, who had, in the notorious "Payne bill," apparently closed the door to Americans who desired steam yachts of modern

type. It is no longer possible to import and use a steam yacht of foreign build, but there is no restriction on the purchase of a foreign design. One New York yachtsman, Mr. Isaac Stern, has taken advantage of this fact to secure a design from Mr. George L. Watson, of Glasgow, from which he will build at the Bath Iron Works, Bath, Me. The new yacht will be similar to the *Andria*, designed by Mr. Watson for John E. Brooks, formerly owner of *Resolute*, Montauk and *Lasca*, but a little larger. She will be 165ft. on l.w.l., 25ft. 9in. moulded beam, 15ft. 4in. moulded depth and 12ft. draft. Her name will be *Virginia*, she will be rigged as a two-masted schooner, and it goes without saying that she will be a handsome craft.

SINCE *Columbia* and *Shamrock* have been under construction the public has continually asked why so much secrecy was sought by their builders and designers. It is also asked whether rival designers, who are preparing boats for the same contests, copy each other's work when they get the chance. Such a case has never been reported. To any one acquainted with the vast amount of work necessary in arranging every small detail for a large modern racing yacht, the idea of materially altering the designs that have been ready for months, after the boats are half constructed, is absurd. The shape of the yacht and every particle of the material that is to go into her are settled and down on paper long before even her lead keel is cast, and the suggestion that Fife might give credence to some newspaper story from America and change *Shamrock* at this late hour is unimaginable. Fife knew all about *Defender*'s lightness of build, and about every part of her construction before he drew a line of *Shamrock*'s shape. It may be taken as a certainty that every possible attenuation to construction was considered and settled months ago, and that he is not waiting for reports of the *Columbia* in order to find out what to plate his boat with.

With such builders as the Herreshoffs and the Fifes, it cannot be supposed that either firm is looking for help from the other, and after the frames are in place and two-thirds plated any further continuance of secrecy in regard to either boat may be ascribed to the desire for advertisement.—New York Tribune.

Yacht Designing.—XXIX.

BY W. P. STEPHENS.

(Continued from page 313, April 22.)

THE straight edge, T square and triangles are common to all drafting, mechanical, architectural or marine, but in the practice of the latter they are supplemented by the splines and weights and the set curves. These require more skill in their use than the simpler instruments employed for straight lines. In most drafting the eye plays a small part, it is merely a matter of mechanical manipulation to lay off certain points at the proper distances, to join them by straight lines, and to draw by means of the triangles or T square other lines perpendicular or parallel

Fig. 66.

to the first. A great deal more than this, however, is necessary when it comes to drawing the numerous curves of a yacht design; the eye of the draftsman must be trained to detect and rectify the slightest unfairness in a batten, or in the joining of two portions of a line drawn with different curves.

In using the batten, as in all long curves, the points of the curve are first plotted and then the weights are placed on the drawing a short distance back from the proposed line. A batten of suitable size being selected, neither too rigid nor too flexible, and somewhat longer than the proposed line, it is taken in the left hand and placed on the paper close to the point marking the extreme right end of the line, the nearest weight being placed to hold it. The fingers of the right hand may be used to steady the right end of the batten for the moment, while the left hand is slid along to the left end of the batten, the thumb being on the inside and the four fingers on the outside. Held in this way, the batten may be lightly sprung to a fair curve, and when it touches the second spot it is anchored there by another weight, placed by the right hand. If the curve is a sharp one and the first weight unlikely to hold, one of the hook weights may be placed over the extreme end to prevent the batten from flying away. If the end does get loose, pencils, scales and any other instruments within its range will be fired through the air with more force than is good for them.

The batten may be sprung from spot to spot, with weights at suitable distances, until the curve is covered, when the extreme left end may be secured with the hook weight. It is difficult to draw a fair curve with a batten just the length of the line, the batten should be at least 6 to 8 in. longer at each end, if the size of the board will permit, and it should be sprung and weighted to a fair curve for this full length; though, of course, only a portion will be drawn in. After the weights are all placed, the batten should be carefully coned in a good light and from both ends, to make sure that it is perfectly fair; the weights being shifted if necessary until it is so. The weights and batten in position for drawing a line are shown in Fig. 66. A batten should never be subjected to such strain as to run the risk of breaking it; if it will not bend freely a lighter one must be chosen, or the set curves must be used instead.

A line drawn with the batten is necessarily continuous,

without breaks or angles, but in using the set curves great care is necessary to avoid these latter, and also to join neatly the different parts of the line, as it is necessarily drawn in sections. Starting at the left end, a curve is selected that will make a fair sweep for at least the total distance between the first three points, beyond which it may diverge from the desired line. The first section drawn should not extend to the point of divergence, but should stop well short of it, then the curve is shifted ahead or a new one chosen to fit the next portion of the line and overlap fairly a part of the line already drawn in. Another short portion is drawn and the curve again adjusted further ahead. In this way what may be termed a long splice is made between each two adjoining parts; whereas, if the first part be drawn clear to the point of divergence and the curve is readjusted so as just to catch this point, the result will be a series of abrupt and broken joints.

In inking with the set curves, or in extending any portion of an inked line, a little care is necessary to avoid an apparent break or thickening of the line at the joint. The pen is held clear of the paper, over the portion already drawn, and moved firmly ahead, at the same time dropping until it lightly touches the paper, continuing with a harder pressure on the new line. Under the most favorable conditions, on good paper, it is not always possible to draw a satisfactory line at one stroke, and when working on vellum it is still more difficult. Where

Fig. 67.

the line is faulty in places, or where, as in work for photo reproduction, a specially hard and black line is necessary, the pen must go over the line two or even more times. Under no circumstances should the pen be pushed backward, nor the pencil either for that matter, but it should be lifted from the paper, carried back beyond the break, and started ahead with a steady motion before it is lowered to touch the paper.

When the drawing is completed in pencil it should be cleaned, using soft rubber or stale bread. The latter should be neither pasty nor very hard, but dry enough to crumble freely. It is crumbled over the paper and rolled in with the palm of the hand, being forced down into all the small depressions of the surface and carrying away the dirt and dust with which it comes in contact. After the use of bread or rubber, the paper is brushed with a soft brush or a fine cloth. In all operations, erasing, brushing, pencilling and inking, the movement should be the same, from left to right.

The drawing being clean and free from all dust that might obstruct the pen, and the ink being mixed, the steel eraser, the sand rubber and a piece of blotting paper are placed at hand on the board, and the work of inking is begun, the circles being first drawn with the compasses, after which the set curves are used for the non-circular

Fig. 68.

curves. All curved lines should be drawn before the straight lines. When a blot occurs, and it will be soon enough at the hands of the beginner, the first thing to do is to wipe the ink off the outsides of the blades, where it has run, and to lay the pen down, not on the paper, but on a remote part of the board or table. Next, the blotter is applied to the paper and at the same time the T square, batten or curve is lifted clear. As soon as the paper is blotted, the ruler should be wiped clean and laid aside. After the loose ink has been removed with the blotter and the paper is dry, the sand rubber or ink eraser should be used, with a slow steady stroke from left to right. In this work the surface of the paper is protected by a piece of metal or cardboard with holes and

slits of various sizes cut in it; a slit of the proper size is placed over a portion of the line to be erased, and the rubber is applied through it. In some cases the sharp steel erasing knife will be needed in addition to the rubber. After the line or blot is erased and the paper brushed clean, the surface is rubbed with an ivory paper cutter or the end of an ivory pen handle until it is hard and glossy. Especial care is needed in re-inking after erasure, as the new surface of the paper is much more absorbent than the original one. On cloth the processes of erasure and re-inking are still more difficult.

There is a very great difference in the fluidity of the various inks; and a pen should be tested with every change of ink. For this purpose a small piece of paper may be kept on the table beside the ink saucer, a much better plan than the indiscriminate marking up of the margins of the drawing. Even in the same mixing of stick ink a difference will be found, as the pen is used for a little time, and after each filling it should be tried on the paper until it gives precisely the same line as at first.

Colored inks are a great aid in a marine drawing, setting out clearly to the eye the many complicated lines. As previously explained in Part XIV., red, blue and green inks can be used to good advantage in indicating various classes of lines. For this purpose the colors may be mixed from ordinary artist's water colors, in small cakes, or they may be had already mixed. The latter are the more convenient, and relatively better, as compared to the cakes, than the liquid India ink compared with the stick ink. The fluidity of the different colors varies greatly, however; red works easily and freely, but by no means as easily as green; a pen that is set right for red ink, making a sharp fine line, will give a broad ragged line if used with green ink. Of course, a pen must be thoroughly cleaned in working from one ink to another, but in addition, it will probably need to be readjusted as well. As a safe precaution, the pen should be tried in all cases before applying to the drawing.

As a rule, fine, sharp lines are the best for marine work, with distinct and clean-cut intersections, these being far more important than pictorial effect. It takes longer, however, to draw a very fine line than a moderately heavy one, and the draftsman must decide for himself just how fine he can afford to work without expending too much time. It should not be necessary, however, to use a much heavier line than those in Figs. 57, 58 and 59.

The dividers are so constantly in the hands of the marine draftsman that a complete mastery of them is indispensable. The method of holding them is shown in Fig. 67; they are picked up with the thumb on top of them and the first and second fingers beneath, just below the joint. They should just balance on the two fingers, while the thumb lies between the legs. Held in this way, the legs may be closed by the pressure of the two fingers on the outside, or opened by the pressure of the thumb on the inside. A better description of the movement is that in closing the instrument the inner leg, nearer the body, is held by the second finger and thumb, the first finger, on the outside of the outer leg, pushing it in. In opening the legs the grasp of the thumb is transferred, to aid the first finger in holding the outer leg, while the end of the second finger, on the inside of the inner leg, forced it out. The motion is really a simple one, though some practice is necessary to acquire it. When first picked up the dividers lie poised with the legs nearly horizontal, a turn of the wrist brings the points down to the paper, and one, usually the inner, is held just over one of the two required points. The instrument is now adjusted very nearly to the other point, one leg is dropped until it rests on the paper at the point, and the other is re-adjusted until it coincides exactly with the second point. This should be done not merely without jabbing a great hole through the paper, but without making more than a slight indentation on its surface. The distance thus picked up will be transferred to some other part of the drawing, either to check a measurement already made or to mark a new one, in which case one of the points is used to ream a very small hole in the surface.

It is possible to use the dividers constantly on a drawing without making a mark that shows through on the other side, and it should be the aim of the draftsman to do this. After the distance is taken from the drawing, as just described, the position of the thumb and fingers is slightly shifted, until the instrument is firmly grasped by the joint instead of by the legs, as shown in Fig. 68. If it is merely a matter of testing or transferring one distance, this new hold is not necessary, but it is where a distance is to be set off any number of times. In this case the instrument is held lightly but firmly by the joint alone, and it is rolled over between the thumb and fingers, not continuously in one direction, but back and forth, describing first a semicircle on one side of the line and then on the other, as in Fig. 68. All spacing of distances, with the plain dividers or the bow instruments, is done in this way, alternately to one side and the other.

There are some points that are used so constantly that it is almost impossible to avoid wearing through, one of these is the central point on the body plan, the intersection of the L.W.L. and the middle vertical, from which a large number of measurements are taken. In this case the proper method of working is to place the point of the dividers on the outer spot, merely poising it over the central spot without actually touching it. The reverse of this is usually done, the point of the dividers is placed at the center for each separate measurement, so that by dint of fifty or a hundred applications, however light, a hole is finally made. By the other plan the same number of applications is divided among a large number of spots, on frame stations at L.W.L., diagonals, inclined waterlines, etc., each individual spot receiving very little injury. It may be noted here that much of the work thus done by the dividers can be done as well by means of a strip of paper and a sharp pencil, the measurements being marked on the margin of the paper. For this purpose a good quality of writing paper may be cut into strips. In taking off the half breadths, for instance, the paper is laid to the proper level line, a corner just touching the center line, then all the half breadths of the fore body are marked at one time. The same process is followed with the diagonals, inclined lines, etc. With

this method, there is, of course, no injury to the paper and the work can be done quickly and very accurately.

The compasses are handled precisely as the dividers, adjusted in the same manner and then grasped by the joint and swung around, the head rolling between the thumb and fingers. Some compasses are furnished with a handle on top of the joint, but this is a doubtful advantage. The thickness of the line drawn with the pen point of the compasses depends very largely on the pressure, and by a little manipulation the compasses may be made to draw a circle of varying thicknesses, as is necessary in shading. In all cases the compasses should be held exactly square to the surface of the paper, and the joints in the legs should be used, according to the span of the instrument, to keep each leg square to the paper.

Where many circles are to be drawn from the same center, a device called a horn center is used, a ring of metal enclosing a small circular piece of transparent horn, on which a central dot is marked, the ring being provided with very small points, which hold it in place on the paper. The horn is adjusted over the point and carries the needle point of the compasses.

The needle point, shown in Fig. 45, has already been described; a very fine point with a shoulder above. It is an awkward instrument, more difficult to adjust to a given point than the plain conical points shown in Figs. 49 to 53. In making really accurate measurements, either in plotting with the pencil or in using the dividers or compasses, it is a great help to have a long fine point to work with, instead of the large leg and set screw and the thick shoulder of the needle point.

[TO BE CONTINUED.]

Columbia.

THE Boston Globe continues to publish information concerning the new Cup defender, which is interesting and we believe sufficiently true to entitle its yachting editor, Mr. Robinson, to the first prize in the guessing contest. During the past week it has given two important pieces of information, including the actual measurements of the spars and a description of the yacht from personal observation, as follows:

Just seven weeks ago to-day (April 26) the first of the Tobin bronze plates of the new Cup defender Columbia was put in place. To-day she lacks but about a strake and a half of the six strakes of plating that will shut her in, and the prospects for a launch in about four weeks' time seem to be fairly good.

The first four strakes of plating, counting from the keel upward, are in place, and most of the plates are riveted. The sixth, or top strake, shows plates for about half the length of the boat amidships on each side. None of the plates of the fifth or next to the top strake are in place, so that the extreme ends of the boat are not shut in, and show the frames as originally set up. This makes the boat something more than half plated and riveted, but there can be no slacking up in the work if she is to be out on time.

Nearly all the plates to complete the shutting in of the boat have been bent and have had the rivet holes punched in them, so that it is only a question of putting in place and riveting. At the same time the work on the bilge stringers and all the interior strengthening of the boat is so well along as to make it practically certain she will be ready for launching with the completing of the plating.

The Globe's yachting man had a good look at the boat to-day for the first time and therefore speaks of the progress of the work from personal observation. Perhaps the Herreshoffs invited him to visit the shop, and then again perhaps they didn't, but "How do you like her?" was John B. Herreshoff's pleasant inquiry after the observation had been taken, and he seemed satisfied at the expression of admiration for the boat that was given in response to the question.

And the expression was given in all sincerity. Columbia is certainly the finest of the many Herreshoff productions and excels even the handsome and smooth-looking Defender in the beauty of her lines and model. She is the thoroughbred racer all over; a legitimate development and improvement from other Herreshoff models, and promises to be a boat to which the American people can confidently pin their faith in the contests with Shamrock in October.

Little more than a general idea of her model can be obtained from a look at her in the shop. She is so big, she fills it so completely, she towers so high above an observer on the floor of the shop that dimensions of beam and depth could be little more than an estimate. Recourse must be had for these things to something more than simple observation, but a good idea can be had of the sweep of the lines of her underwater body and its general shape. Fortunately these dimensions have been previously obtained, and are as follows: Length over all, 131ft.; water line, 90ft.; beam, 24ft.; draft, 20ft. Length and beam are slightly under what the boat shows. The waterline is designed at as close to the limit of 90ft. as the designer dares to go, while the draft is likely to be under than over the figure given.

The midship section shows a little flatter floor than in Defender, but the bilge is the same easily rounded one that has marked all the Herreshoff designs. It looks a bit harder than Defender's but is very easy at that. The lead keel shows more of the plate shape already described in the Globe than of the bulb shape of Defender, and the weight of the lead is carried considerably lower than in the old boat.

Columbia is cut away forward more than Defender, and the line of the stem as it rises toward the water line, after curving upward from the lead keel, is almost a straight line. From the waterline upward the curve is not so sharp as in Defender, but is more marked than in Vigilant. The bow will be a handsome one. The bow frames show about half way between the U and the V shape, or more of the former than in Defender, thus showing a design to use the overhangs considerably when heeled. The whole effect of the bow is for a more powerful one than in Defender.

And this is also true of the impression of the boat as a whole. She is a more powerful and finer-lined boat than Defender. She cannot only carry more sail, but carry it

better, and at the same time be more easily driven. She ought to beat Defender on model alone.

The common in-and-out system of lap plating has been used on the boat, except that the plates of the second and fourth, or two lowest "in" strakes, have had their upper and lower edges turned inward or flanged, the flange being something over an inch deep. The plates have not been abruptly bent in working the flange, but the bend is an easy one. Spaces are cut in the flange for the frames to pass through, and the flanges do little more therefore than stiffen the plates themselves between the frames. They do not in any way take the place of bilge stringers.

There is of course no evidence of this flanging from the outside. It is not "knuckle joint" work, for the bronze plates could not be bent to such a joint, but is the simple flanging of the "in" plate as described in the Globe weeks ago. It stiffens the plating where the greatest strain comes, and that is all.

The lower strakes of plating are $\frac{1}{4}$ in. in thickness. The bronze shoeing on the lead keel is $\frac{1}{8}$ in. The top strake plates look too handsome to be ever covered with paint, and it is shrewdly argued that had paint been intended, nickel steel would have served the purpose better than bronze. So the outlook for a bright boat above the waterline is still a good one.

The boat rests in the cradle, built specially for hauling out Defender. Consequently she sets level as she will when afloat, for she is intended simply to float out of the cradle when it is lowered into the water. The bottom of her lead keel is level and parallel with the waterline, as already told.

Mr. Herreshoff was not inclined to say definitely when she could be launched, but pointed out that she was being finished as rapidly as possible. In the north shop the workmen are busy with the steel mast, working from the middle toward the ends. The semicircular steel plates, of which the shell of the mast is being made, are about 9ft. long, and lap by each other on opposite sides for about half their length. The frame of the mast is the longitudinal steel angles and the transverse disks or stiffeners of steel plate. The angles are bulbed like the frames and deck beams of the boat and are in long lengths. At their ends they are joined by lapping and riveting. There are eight of these angles, and they run the whole length of the spar.

The stiffeners are circular disks of steel, about 20in. in diameter. In the center is cut a 14in. hole, both to decrease the weight and to allow a man to crawl through. Around this large hole are several smaller ones cut out to save weight. Spaces are cut for the angles. The outer edge of the disk is flanged and riveted to the plates of the shell. The inner edge is flanged in the opposite direction.

The shell plates are riveted on their edges to the steel angles, and on their ends to interior butt plates, so that the outside surface is a smooth one. The plates are also securely riveted all along to the angles, making a very strong spar. In riveting the plates it is necessary for a workman to crawl inside the spar to hold a sledge on the head of the rivet being worked upon, and it is a curious sight to see a man half in and half out of the iron shell.

The diameter of the spar looks to be about 21in. The stiffening disks are placed about $4\frac{1}{2}$ or 5ft. apart. Apparently a length of some 50 or 60ft. has been completed.

If the spar is the same length as the Oregon pine mast now finished and awaiting shipment at the Boston Spar Company's shop, in East Boston, it will be about 107ft. in length. The steel gaff has been completed and is lying on the north pier, where the Defender is moored. Material for the steel boom has been got out, but the work of putting it together has not been started.

Red lead has been freely used in the interior of the steel spars, and also on the frames of the boat, so that her colors are at present red and gold, the red showing on the still uncovered frames.

But later she will be gold from keel to rail.

Mast, 107ft. 6in.; topmast, 64ft.; bowsprit, 38ft., and spinnaker pole, 73ft.

These are the lengths by actual measurement of the Oregon pine spars for the new Cup defender Columbia now building by the Herreshoffs at Bristol.

The spars have been made by the Boston Spar Company in its shop on Condor street, East Boston, and have been carefully kept from public observation. To-day (April 29) they were put overboard from the shop, were lashed together with other Herreshoff spars in a compact raft, and were towed to the wharf of the Magee Furnace Company in Chelsea, just across the channel from the spar company's shop, and were there made fast.

There they will stay until Monday, when they will be towed to Fiske's wharf in the city proper and be put on board the schooner Nat Ayer, which has been specially chartered by the Herreshoffs for the shipment of the spars to Bristol. Fiske's wharf has been selected as the place of shipment because of the big shears there, which can handle the big spars as easily as the smaller ones.

The part of the wharf in Chelsea where the raft is now made fast is not a good point for public observation, since a building rises direct from the cap sill, but there are such things as boats, tape measures and foot rules, and the Globe has men who know how to use them. There was no watchman in sight near the raft about sunset last evening, and the big spars in the raft were not hard to pick out and measure.

The mast for Columbia and the mast for W. O. Gay's 70-footer form the sides of the raft. Between them are the topmasts, bowsprits and spinnaker poles of the two boats, with the boom of the Gay boat. On top are piled the gaff of the Gay boat, the double sets of club topsail poles for Columbia and a set of spars for a 56ft. yawl which the Herreshoffs will soon launch. This comprises the entire Herreshoff order to the spar company. With the exception of the mast there are duplicates of all the spars for Columbia, so that a spare one may be handy in case of accident. No wooden boom or gaff has been made for Columbia, since these spars are to be of steel and built by the Herreshoffs themselves.

The lengths of the principal spars of Columbia are very close to those given in the Globe three weeks ago. The mast proves to be 6in. longer, the spinnaker pole 1ft. shorter, and the topmast 2ft. longer. The length of the bowsprit is the same as then given. The mast where it is squared at the hounds is just 22in. in diameter. At

its heel, where it will go into the step in the boat, it is rogin. The masthead takes up 22ft. of the length of the spar, and is simply roughed out in an octagonal form, but the rest of the mast is rounded and beautifully smoothed and finished. The other spars are completely finished. The iron work of the spars will be fitted at the Herreshoffs'.

The mast will show a measurement of between 76 and 77ft., deck to hounds, when in place, this measurement being dependent on the amount of "bury" given the mast in the boat, or the portion of its length below the deck. It will probably be between 8 and 9ft., as in Defender.

Defender's mast was 72ft., deck to hounds, and her topmast 58ft. long. Columbia's sail plan will therefore be carried about 10ft. higher than Defender's, and will mean not only a considerable increase in sail area, but also a much more effective sail plan. From this is apparent the need of the extra power and stability which the hull of Columbia shows over that of Defender.

The spinnaker poles of the two boats are practically of the same length, showing the base of the fore triangle to the same. With Columbia's mast placed farther aft than Defender's in order to correct the fault of a lee helm found in the latter boat, it is not probable that a longer main boom will be carried than in Defender, so that all indications point to an increase in the sail plan aloft and not on the base line.

Defender's sail area for measurement for time allowance was 12,602 sq. ft. Columbia's promises to be only about 700 sq. ft. more, certainly less than a thousand, but the increase will be aloft, where it will do the most good.

Another Herreshoff cat has escaped from the bag. The steel mast, on which work is now being rushed at Bristol, is not for Columbia, as has generally been supposed, but is for Defender, and will be put in place in that boat and given a thorough trial. In the meantime the Oregon pine mast made by the Boston Spar Company will be stepped in Columbia, and if the steel mast in Defender proves satisfactory, there will be ample time to make a steel mast for the new boat.

This is the secret of the laying aside of the parts of the steel boom for Columbia and the rush of work on the mast in order that it may be put in Defender as soon as possible and the boat herself put in commission and tried under sail. The trial of the steel spar in Defender will show its strength or weakness, its greater or less value, than an Oregon pine spar, as the case may be. If it should prove unsatisfactory, the old Oregon pine spar will be at hand to put in its place, and the expense of a steel mast for Columbia will be saved.

It is a common sense way of solving the question of the value of a steel spar, and Mr. Iselin and the Herreshoffs are very lucky in having the Defender at hand on which to try the experiment. This will be the first steel mast to be used in a racing yacht, and the result of the experiment will be watched with great interest. The supposed advantage of a steel spar is its greater strength and less weight as compared with a wooden spar.

The steel mast for Defender is 100ft. gin. long, and is constructed as described at considerable length in the Globe of Thursday last. Defender's Oregon pine mast was 101ft. The difference between the two is too slight to be considered. The steel mast is close to 21in. in diameter. The Oregon pine mast was a trifle more than that, but the steel one can be made to fit the hole in the deck just the same.

The Yachting World gives the following particulars of the mast of Shamrock:

While reports that the new defender's mast will be built of steel have been coming from the other side, together with denials and confirmations of the report, William Fife, Jr., has gone on steadily with the construction of Shamrock according to the plans which were finished down to the smallest details before the order was placed. The question as to whether a steel or wooden mast would be likely to prove the more satisfactory was fully considered before a single line was drawn, and the designer then decided upon wood. This decision has never been reconsidered, and, as a matter of fact, Shamrock's racing mainmast is now lying at Messrs. Thorneycroft's practically finished, and almost ready for stepping. It is a beautiful stick of Oregon pine, which looked well in the log, and has finished even better than it promised. It is without exception the longest spar ever stepped in a racing boat, and in over-all length it tapes 110ft. Following the fashion which is now universal, it carries its greatest thickness at the hounds, and just under the crosstrees it measures within a fraction of 60in. in girth. It is reduced then with a long-drawn taper until half way to the deck line the girth is barely 50in., and it carries this right down until it is cut for the step.

In view of the importance of reducing the weight aloft, it was thought that the principal metal work of the mast would be of the same manganese bronze of which the hull is being built. The difficulty of getting a perfect and absolutely reliable job in metal so difficult to work determined Mr. Fife, however, to sacrifice this slight advantage and have the mast fittings made of iron in the usual way. These important fixings have, therefore, all been made at the Fairlie yard and sent south as finished, to be fitted and placed in position. Nothing has yet been done in the construction of the gaff or boom, but it is understood that they will both be of metal.

The latest reports from Thorneycroft's point to the fact that Shamrock will not be ready for launching before the end of May. With the aid of specially constructed furnaces the lead keel of the challenger, of some 80 to 100 tons, has been successfully cast, under the supervision of William Fife, and in the presence of the owners of the yard and a number of experts.

According to a cabled report on April 27, Mr. Will Fife, Jr., is seriously ill with la grippe. With Capt. Urias Rhodes, who will sail Defender with Mr. W. Butler Duncan as representative of the owner, will be "Lem" Miller, well known in connection with Volunteer in 1887, and later with Vigilant and Colonia, as mate.

Aileen II., the new steam yacht now nearly completed at Chester for Richard Stevens, has been chartered for the season to Wm. H. Patterson, of New York.

Going Astern.

The South Boston Y. C. has issued the following circular to its members:

"We desire to call your attention to the twenty-eighth open regatta of the South Boston Y. C. Decoration Day, inaugurating the racing season of 1899, in conjunction with the opening of our new club house. As racing is the life of clubs, we believe in the open-door policy in this branch of sport, and that there should be a distinction between rules for match racing and interclub racing, and that yachtsmen should be encouraged in racing, not legislated out of it. If new boats should not be legislated against, surely old ones should not. If twenty boats in a class is picture making, it is a sorry spectacle to see but three in a class in an open race.

Therefore, in order to encourage the starting of a large fleet of yachts in this season's racing, the S. B. Y. C. will start off in arranging special classes, outside association rules, with liberal prizes—a wide open race.

In order to get the sentiment of the racing men, we give you on return card three rules relating to measurement, and ask that you state your preference by putting a cross against the rule preferred. Any modification of the enclosed rules will be carefully considered by the committee.

- I. Waterline length with crew on board.
- II. Sailing length equals the length 3in. above and parallel with the waterline.
- III. Waterline length plus one-fifth overhang forward and aft.

Time allowance according to Herreshoff table.

We are in sympathy with all of those yachtsmen who are dissatisfied with the conditions existing in yachting for some years past, and also with the efforts made to improve them; but at the same time we regret to see thought and labor wasted in a task that is useless and fruitless. The three methods of measurement mentioned above are happily obsolete; they have passed away and have gone where they belong, to join the rope shrouds and lanyards, the deadeyes and the stone ballast of a past generation. There are many things which are uncertain, both in the present and future of yachting, but if there is any one thing that is fixed beyond question, it is that the "plain and simple rule" in which length alone, however measured, or even length and sail area, are the sole factors, is the direct parent of such freaks as Cartoon, Skate and the new Boston 35-footer. If racing is the object, it is not possible to build anything but a freak under any form of waterline rule, with a heavy penalty on the waterline when the yacht is at anchor, and no limitations to draft, fin or length of effective waterline when heeled. That good yachts have been built in the past, or even up to last year, under the length rule and the length and sail area rule, in no way proves that the designer who wishes to win to-day can consider anything else but the evasion of the measured waterline and the forcing to an extreme of every untaxed element of speed.

We do not question the good intentions of the South Boston Y. C., but in thus diverting the attention of yachtsmen from the vital questions of the day to dead and obsolete issues they are simply wasting their own time and doing harm instead of good to the sport. There is no question that the best rule thus far tried or proposed is very far from perfect, but what is needed is an earnest and intelligent effort to discover a rule fitted to modern conditions. The mere aimless condemnation of every move in advance without any practical propositions of something better is both foolish and unfair.

The Anchorage Grounds of New York Harbor.

YACHTSMEN and shipping people generally will be interested to know that the new anchorage grounds to be established under the provisions of a recent act of Congress for Newark Bay, Raritan Bay, and the Kill Von Kull have been reported on by the officers charged with the enforcement of the anchorage laws at this port, and that the new regulations will go into effect in a few days. Two anchorages have been marked off in the Kill Von Kull, one on each side of the main channel. The northern anchorage is bounded by a line passing through the dumb beacon off Bergen Point. The red channel buoy dumb beacon off Constable Point and the red channel buoy off Bergen Point. The southern anchorage is set off by a line running from the power house at Factoryville to Starin's dry dock.

In Newark Bay two anchorage grounds have been set aside. They lie respectively to the eastward and westward of the main channel. The eastern anchorage is bounded by a line passing through the Newark Bay lighthouse and the eastern end of the draw of the New Jersey Central Railroad bridge. The western anchorage lies to the westward of a line passing through the eastern end of Shuter's Island, the black buoy to the northward and the western side of the railroad drawbridge.

Another anchorage has been provided off Elizabethport. It is set apart by a line which runs through buoy No. 4 and buoy No. 2, and thence to the western pier-head of the Central Railroad bridge. In Arthur Kills an anchorage has been marked off to the southward of a line passing through Clark's wire works building, Buckwheat Island, and the phosphate works. At Prawl's Island an anchorage is defined to the southward of a line running through the southern end of Prawl's Island and the old dock off Linoleumville. On Story's Flat there will be an anchorage to the southward and westward of a line passing through Smoking Point, the red channel buoy and Kreischerville wharf.

Off the terminus of the Port Reading docks in Arthur Kills an anchorage will be afforded to the northward of a line passing through the Port Reading wharf and the entrance to Smith's Creek. At Perth Amboy provision is made for an anchorage to the northward of a line passing through the western coal pier of the Lehigh Valley Railroad and the black and red buoy off Perth Amboy, and from thence to Great Beds lighthouse. Off Tottenville the new anchorage ground will lie south of a line passing through the red buoy off that place, and extending in a direction northeast by east.

In Raritan Bay the anchorages are defined as being clear of the dredged channel. The Treasury Department

will shortly issue a chart and printed instructions on the subject of the new anchorage grounds for the information of mariners. The fine for anchoring in other than prescribed localities, except in case of an emergency, is \$100.—New York Evening Post.

New York Y. C. Races.

The regatta committee of the New York Y. C. has issued the following circular of the season's races:

The New York Y. C., season of 1899.

New York, June 22.—The fifty-third annual regatta.

New York, July 1.—The Columbia and the Defender. Course, fifteen miles to windward or leeward, and return, from Sandy Hook Lightship. Cup offered by the club, \$250.

The Fifty-fourth Annual Cruise, Aug. 7.—The rendezvous will be on this date, at a port to be selected by the commodore. There will be the customary club prizes for the squadron runs; the Astor cups will be sailed for over the Newport courses, and the dates and places for other special cups and the Owl and Gamecock colors will be given later.

New York, September.—The trial races for the selection of a vessel to defend the America's Cup will be sailed during the first two weeks in September.

The Autumn Sweepstakes will be sailed in September, after the termination of the trial races.

New York, Oct. 3.—The America's Cup.—As at present arranged with the Royal Ulster Yacht Club, the first race of this match—best three out of five, with one day's interval between each race—will be on this date.

CLUB STEAMERS.

Annual Regatta.—A steamer and lunch will be provided at the club's expense. Under by-law she will be restricted to members and the ladies accompanying them, and those officially invited.

The America's Cup.—Members will be provided with a steamer at the club's expense, and will be enabled to procure extra tickets. All tickets will include lunch.

Arrangements for witnessing other important racing events will be announced later.

S. NICHOLAS KANE.
CHESTER GRISWOLD.
IRVING GRINNELL.
Regatta Committee.

Owing to the abandonment of the Bay Ridge Ferry, Station No. 1 is no longer accessible, and it will be re-established at Staten Island, in many respects a better location.

The Quincy Cup.

WITH the challenge from the Annisquam Y. C., the Quincy Y. C. now has four challenges for its \$500 cup for 21-footers on its hands, and will need all the skill its racing men possess to safely keep the trophy from a visit to another organization. More interesting than ever will be the races for the cup, while the addition of five new 21-footers to the racing fleet will be a "boom" for that class and for the sport itself, which should be ample justification for the original offer of the cup for its continued existence as an interclub challenge trophy.

The date for the first race has been fixed for Monday, July 24. W. E. C. Eustis, challenger from the Beverly Club, has asked that a later date be set, and the club committee will soon call a conference of the challengers and will see if a date satisfactory to all cannot be agreed upon. At present it looks as though July 24 was the only available date, on account of the tides in Hull Bay, and because later dates, when the tide would serve, have been taken by other clubs, but the whole matter will be carefully considered.

With five boats in the match, the question has been asked as to how many races will be necessary to decide the ownership of the trophy. The question is answered by the deed of gift, which says: "A yacht must win three races of a series to win the cup. After four races of a series have been sailed, only winners of at least one race shall be allowed to compete; after six races, only yachts which have won two races."

With five competitors this makes a possibility of at least four races to start with; if a different yacht wins each day. Two additional races must then be had between these four boats, but if it should happen that a different boat wins in each of these races, another race between the winners of two races each must be had to decide the ownership. This makes a possibility of seven races in all, although of course an earlier settlement is the probability.

The latest challenger is being designed by Crowninshield for Com. Hastings, Vice-Com. Bent and W. B. Pigeon, of the Annisquam Y. C., and is to be about 39ft. over all, 9ft. 6in. beam and 9in. draft. She is to be decidedly on the scow type, although her deck line will round in forward in the usual way, and she will carry about 900 sq. ft. of sail. As compared with the other boats, she will be a compromise between the Heiress and the extremes of the scow variety, as shown in the Abbott boat and the Quincy defender.—Boston Globe.

Robert Goelet.

ON April 28 the news reached New York by cable of the sudden and very unexpected death of Robert Goelet, of New York and Newport, on board his steam yacht Nahma, at Naples, the cause being heart failure. Mr. Goelet was the elder brother of the late Ogden Goelet, who died a little over a year ago under very similar circumstances on board his steam yacht Mayflower at Cowes. The two were sons of the late Robert Goelet and nephews of Peter Goelet, Robert being born in his father's house, No. 5 State street, New York, on Sept. 29, 1841. With unlimited means at his command, he was never in business, though devoting himself to the care of his estate. He was a liberal patron of music, and, though not interested in yacht racing, he was, like his brother, a good friend to the New York Y. C. The body will be brought home on the Nahma.

The Canada Cup.

THE following letter practically settles the date for the first race of the series for the Canada cup, as it is understood that the date is acceptable to the Chicago Y. C.:

Charles H. Thorne, Secretary of Chicago Y. C.—Dear Sir: In reply to your favor of the 3d inst., regarding settlement of date for Canadian cup races, I am requested to inform you that our committee this day fixed the date of the first race of the series for Monday, Aug. 21, and the course to be sailed, south of Toronto Island. We understand this decision will be favorable to you, and may now be inserted in our respective agreements governing the race. The committee begs to apologize for the delay in naming the date, for which, however, they are not wholly responsible. F. J. RICARDO SEAVER.

Honorable Secretary Royal Canadian Y. C.

The dates in connection with the entire series of races are consequently as follows: Trial races of challenger, Chicago, July 4, 5 and 6; trial races of defender, Toronto, Aug. 7 and following days; Lake Y. R. A. race week, Toronto and Hamilton, Aug. 14 and following days; first cup race, Toronto, Aug. 21. The latest news is that Arthur E. Payne, of Summers & Payne, Southampton, Eng., has designed a 35-footer for the defense, the yacht to be built for Toronto yachtsmen. Mr. Payne has scored many successes, such as Decima, Penitent, Gloria, Eldred and Emerald, the latter a 36-footer, and he is likely to turn out a very fast boat; the only point is that he has as yet had no experience in designing for American conditions. The following yachts propose to visit Toronto from Chicago and Detroit: Pathfinder, Com. F. W. Morgan, C. Y. C.; Sentinel, Thistle and Catherine, steam yachts; Siren, Hawthorne, Mistral, Toxteth, Vanenna and Challenger, sailing yachts. The city of Toronto has appropriated \$1,000 toward the racing and the entertainment of the visitors.

Forty-two Miles per Hour.

THIS is the speed promised, according to current reports for the steam yacht for C. R. Flint, designed by C. D. Mosher. This yacht has been in contemplation for several years, and the engines are partly built, but nothing has been done toward the hull, though it has been stated at different times that the Lawleys and other builders had received the order for it. The contract has finally been signed with S. Ayres & Son, of Nyack, builders of the fast Ellide. The new yacht is to be 135ft. on l.w.l., 12ft. 6in. beam and 4ft. draft, with twin screws and quadruple expansion engines. The hull will be of nickel steel and bronze, divided into seven compartments. The yacht will be fitted luxuriously for her owner's use, but it is proposed to make her convertible to a war vessel in a very short time, provision being made for shipping a turtle-back forward, conning towers, and rapid-fire guns.

YACHTING NEWS NOTES.

The annual meeting of the Royal Canadian Y. C., of Toronto, was held on April 22, the following officers being elected: Com., J. H. Plummer; Vice-Com., Geo. H. Gooderham; Rear-Com., C. A. B. Brown; Hon. Sec'y, F. J. Ricardo Seaver; Executive Committee, E. R. C. Clarkon, J. E. Robertson, Aemilius Jarvis, G. B. McMurich, A. G. Peuchen, F. O. Cayley, Geo. Hargraff, W. G. Gooderham, F. M. Gray and F. Campbell. The club is now in a very prosperous condition, with a large membership and a growing fleet. Several new yachts of the 35ft. class will be added this year.

The Douglaston Y. C. held a special meeting on April 19, at which it was decided to change the name to the Manhasset Y. C., in consequence of the recent removal from Douglaston to the new site on Manhasset Bay. The club was organized in 1890. The new station will be opened on June 3 and the annual regatta will be sailed on June 10. Mr. O. M. Lipton has offered a cup for the club's dory class, which has received six new members.

Red Cross, steam yacht, formerly Admiral, has been sold by the Red Cross Society to John D. Crimmins, of New York.

Orinda, cutter originally owned by Dr. W. H. Winslow, has been sold by J. W. Tucker to Wm. F. Williams, of New Bedford.

Mr. Isaac B. Mills, of Boston, the yacht designer, has been elected measurer of the Yacht Racing Association of Massachusetts.

Wayward, cutter, designed by Burgess and built by the Lawley Corporation in 1890, for David Sears, has been converted to a schooner by her new owner, Chas. Smithers. The work has been done at Bayles & Son's yard, Port Jefferson, where the yacht has wintered.

Ramona, schr., recently purchased by Rear-Com. B. M. Whitlock, Atlantic Y. C., from H. M. Gillig, is at Hawkins' yard, Port Jefferson, where she will be converted into an auxiliary. She is best known as the old Resolute, built by David Carl at City Island in 1871 for A. S. Hatch and afterward owned by John E. Brooks. She was sold by the latter in 1887 to Com. Postley, who lengthened and rebuilt her with the aid of Mr. A. Cary Smith, renaming her Ramona. Under the ownership of Mr. Gillig she was for some years the flagship of the Larchmont Y. C.

Nymph, cutter, has been sold by T. H. Pratt to E. J. Bergen, who sold her again a few days later to J. E. Fletcher, of Providence. Mr. Fletcher at the same time selling the fin-keel sloop Memory to Mr. Hope Morton, of New York. Mr. Bergen has since purchased of Chas. L. Poor the schooner Fenella. Mr. Fletcher, the new owner of Nymph, was for some time the owner of Minerva, both of these boats having been previously owned by T. C. Zerega.

The Corinthian Y. C., of San Francisco, opened its season on April 22 with appropriate ceremonies, sailing on the following day to Fort Point, where the squadron of the California Y. C. was met and saluted. In honor of the occasion the C. Y. C. issues a very artistic souvenir volume, with many portraits of officers and yachts.

Intrepid, schr., E. T. Hunt, under charter all winter

to E. Clinton Clark, has been purchased by that gentleman on her return from a West India cruise last week.

Verena, the Burgess 40-footer, practically a sister to Nymph, has been sold by E. A. Morrison to F. de Funiack, of New York, who proposes to alter her greatly. She will be converted to a keel boat, fitted with a 20-horse power gasoline motor, rigged as a yawl and renamed Foxie.

Com. Postley, Larchmont, Y. C., has appointed the following regatta committee for 1899: John F. Lovejoy, chairman; Edward J. Greacen and Howard W. Coates. The club features for the season are as follows: Formal opening, May 27; spring regatta, Saturday, June 17; annual regatta, Tuesday, July 4; race week, from Saturday, July 15, to Saturday, July 22, inclusive; special races, Saturday, Sept. 2; fall regatta, Monday, Sept. 4; special race Saturday, Sept. 9.

Atalanta, schr., has been sold by F. W. Savin to C. H. Brock, of Philadelphia. She was originally the schooner Calypso, burned and rebuilt by David Carl in 1873 for Wm. Astor, and renamed Atalanta.

Black Pearl, steam yacht, E. B. Sheldon, arrived at New York on April 27 from Nassau, after a cruise in the West Indies, having sailed from New York on Feb. 22. Capt. Eldridge is still in command.

Palmer, schr., recently purchased by F. K. Sturgis from Rutherford Stuyvesant, is at Poillon's yard, South Brooklyn, for conversion to an auxiliary. She was built for Mr. Stuyvesant by T. Byerly & Son at Philadelphia in 1865, and was in her day one of the most noted of the great seshooners.

Viking, schr., J. D. Smith, is at Greenport, L. I., where she is being altered to an auxiliary, a gasoline engine of 32-horse power being installed.

Sapphire, steam yacht, A. L. Barber, has been sold to Harrison L. Drummond, formerly of St. Louis.

Within the past year the colony of yachtsmen at Chipewa Bay, on the St. Lawrence River, has taken up the 20ft. class, and it is now very popular. The class at present includes such well-known boats as Skate, Seawanhaka, renamed Flirt, and two boats built last year, Yankee, designed by Gardner, and Minnetonka, designed by H. C. McLeod. Other additions are promised for the coming season and races will be sailed weekly. A. T. Hagen, Rochester Y. C., has a new boat for the class, designed and built by Miller Bros., of Rochester. She is 27ft. over all, 17ft. 6in. l.w.l., 9ft. beam and 10in. draft of hull, 6ft. draft with board; weight of board, 300lbs.; sail area, 500 sq. ft. She will have hollow spars, made by the Spalding St. Lawrence Boat Company.

During the winter L. D. Huntington, Jr., of New Rochelle, has designed and built for W. N. Bavier, of the New Rochelle Y. C., a keel cruising yawl 40ft. over all, 30ft. l.w.l., 11ft. 5in. beam and 4ft. 2in. draft.

The great scow displayed at times last season by the Gardner fin-keel Cartoon in the 25ft. class of the Y. R. A. of Massachusetts, has led to an order for a similar boat for the 35ft. class, the owner being George E. Bruce, of Boston, former owner of Mabel F. Swift II. The new boat will be built by Embree, of Quincy Point, and will be an extreme scow, like Cartoon, practically an enlarged Skate, her dimensions being 60ft. 9in. over all, 35ft. l.w.l., 13ft. 2in. beam and 1ft. 9in. draft of hull, the extreme draft, including fin, being thus far unknown. The fin will be longer and shoaler than in Cartoon, but she will have the same scow rudder. The construction will be much stronger than in Cartoon. The size of the yacht will, in spite of her shoal hull, admit of very good accommodations, the cabin trunk being 16ft. long, with 5ft. 11in. headroom. The space will be divided into a main saloon, two after staterooms, toilet room, galley, etc. The rig is that of a pole-masted cutter, with topsail, the mast being 67ft. long, boom 50ft., gaff 32ft. The contract calls for the delivery of the yacht by June 15.

W. L. Ward, of New York, has now nearly ready at Hanley's yard, Quincy, a cruising sloop of 33ft. over all, 25ft. l.w.l., 12ft. beam and 2ft. draft, with two tons of lead in her keel.

Miller Bros., of Charlotte, N. Y., have on the ways a keel sloop for the 25ft. class of the Lake Y. R. A., for James C. Dryer, of Rochester. She is intended for racing on Lake Ontario. Her dimensions are: Over all, 32ft.; l.w.l., 18ft.; beam, 8ft. 6in.; draft, 5ft.; sail area, 650 sq. ft.; ballast, one ton. She will have hollow spars.

Regina, yawl, designed by Crowninshield and built by Rice Bros. for Hon. W. E. Barrett, of Boston, was launched at East Boothbay, Me., on April 19. She is 76ft. over all, 50ft. l.w.l., 17ft. 5in. beam, and 7ft. draft without board, her outside ballast weighing fifteen tons. Below she has a main saloon 12ft. 6in. long, owner's stateroom, guest's stateroom, toilet room, etc. The same builders have under way two more Crowninshield designs, for Robert Saltonstall, of Boston, and H. H. Bailey, of the South Boston Y. C. Syren, the former, is a keel cutter, of 35ft. l.w.l.; Jungfrau, the latter, is a centerboard cutter 35ft. over all, 23ft. 6in. l.w.l., 10ft. beam and 4ft. draft without board. Both are intended for cruising.

A very useful little volume for yachtsmen has just been published by the Outing Publishing Company under the title of "Yachting Wrinkles." The author is Capt. A. J. Kenealy, the well-known yachting writer, who out of a long experience has gathered together a great deal of valuable and interesting information about yachts, new and old, which is set forth in that easy and familiar style for which he is noted. The book is not only interesting to the casual yachting reader, but it contains a great deal that is of practical value. It is illustrated by numerous pictures and diagrams.

We have received from the secretary of the Yacht Racing Association, B. Heckstall Smith, Esq., whose new address is No. 2 Utrecht Mansions, West Kensington, London, W., the year book of the British Y. R. A. for 1899. The book contains the complete rules, as recently amended, the list of members, allowance tables, decisions of council, etc.

We call attention to the advertisement on another page of the knockabout built by the Buzzards Bay Yacht Agency. This yacht, which is illustrated in the FOREST

AND STREAM of March 18, is a thoroughly staunch and serviceable craft, well fitted for general sailing and cruising.

Canoeing.

The Board of Park Commissioners of Rochester, N. Y., has instructed the Genesee Valley Park Committee to prohibit the use of canvas canoes on the waters under their jurisdiction, on the ground that such canoes are not fit for any human being to ride in. The question came up in connection with the lease of the boat-letting privilege to a man who proposed to put on twenty-five skiffs and some canvas canoes. Such a comprehensive discrimination as this against all canvas canoes does little credit to the committee; if a canvas canoe is unsafe, as many of them are, it is not because it is constructed of canvas, but because it is of defective design or construction, or usually both. There is a class of cheap canvas canoe, built by boys with no knowledge of canoeing or building, which is highly dangerous; but on the other hand, there are canvas canoes without number that are cheaper, but fully as strong and safe as anything built of wood. If the committee is anxious to protect the lives of those desiring to go on the water, it might use a little judgment in approving or condemning certain models, rather than establishing an arbitrary and absurd standard.

CANOEING NEWS NOTES.

There is something suggestive of the good old days of canoeing in the copy we have lately received of the by-laws and constitution of the Springfield C. C., with the familiar totem on the cover. The club is now making an earnest effort to restore its old-time standing, and to this end it has arranged a series of races and other entertainments, to run through the season. There will be ten sailing races for points with two silver cups for prizes and pennants for each race, and five paddling races for similar prizes. Club runs, evening canoe trips, entertainments at the club house and similar diversions are relied on to renew the interest of old members and to bring in new ones.

At the general meeting of the British Canoe Association, held in London on March 17, it was decided to hold the annual meet at Falmouth, beginning on July 29. Mr. George Huntley, Redheugh Bridge Works, Gateshead-on-Tyne, is secretary of the Association.

The winner of the ninth of The Yachtsman's designing competitions, for a light draft cruiser, is Mr. George F. Holmes, of the Humber Yawl Club, an old canoeist, well known to our readers through Eel and other designs. The winning design is of 30ft. over all length, 25ft. l.w.l., 9ft. beam and 2ft. extreme draft of hull, including an iron keel of just over one ton. The draft with board down is about 6ft. The yacht is a double-ended, a large canoe yawl, and looks like a very safe and able craft, with good lines and quite a nice cabin.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

- May 2-5.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-third annual tournament, under the auspices of the Capital City Gun Club; six amateur and four open events each day; targets and live birds. R. M. Welch, Sec'y.
- May 6.—Passaic, N. J.—E. C. cup contest for championship of New Jersey, between Capt. A. W. Money, holder, and Mr. Phil Daly, Jr., challenger.
- May 6.—Philadelphia, Pa.—Meet of the Intercollegiate Shooting Association, on the Keystone grounds.
- May 6.—White Plains, N. Y.—Live-bird handicap. E. G. Horton, Manager.
- May 9-13.—Peoria, Ill.—Illinois State Sportsmen's Association's tournament. C. F. Simmons, Sec'y.
- May 13.—Dunellen, N. J.—Shoot of the New Jersey Central League.
- May 16-19.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. F. W. Bacon, Sec'y.
- May 16-20.—St. Louis, Mo.—Tournament of the Missouri State Fish and Game Protective Association. H. B. Collins, Sec'y.
- May 17-18.—Oil City, Pa.—Interstate Association's tournament, under auspices of Oil City Gun Club. F. S. Bates, Sec'y.
- May 23-25.—Macon, Miss.—Eleventh annual tournament of the Noxubee Gun Club; targets and sparrows; \$500 in merchandise and cash added. C. M. Scales, Manager.
- May 23-25.—Algona, Ia.—Tournament of the Iowa State Association for the Protection of Fish and Game. John G. Smith, Pres.
- May 24-25.—Greenwood, S. C.—Annual live-bird tournament of the Greenwood Gun Club; 25-bird Southern Handicap. R. G. McCants, Sec'y.
- May 26-27.—Tyrone, Pa.—Target tournament of the Tyrone Gun Club. D. D. Stine, Sec'y.
- May 30.—Rutherford, N. J.—Decoration Day shoot of the Boiling Springs Gun Club; good prizes. W. H. Huck, Sec'y.
- May 30.—Canajoharie, N. Y.—All-day target shoot at Canajoharie, N. Y. Charles Weeks, Sec'y.
- May 30-June 2.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. Frank W. Bacon, Sec'y.
- June 3.—New Haven, Conn.—Yale vs. Princeton.
- June 5-10.—Buffalo, N. Y.—New York State shoot, under the auspices of the Buffalo Audubon Gun Club; \$1,000 guaranteed; over \$2,000 in merchandise, and \$1,000 added money in open events. Chas. Bamberg, Sec'y, 51 Edna Place.
- June 6-9.—Sioux City, Ia.—Fifth annual amateur tournament of the Soo Gun Club. E. R. Chapman, Sec'y.
- June 10.—Princeton, N. J.—Yale vs. Princeton.
- June 13-14.—Grand Forks, N. D.—Fifth annual shoot of the North Dakota Association.
- June 14-15.—Bellows Falls, Vt.—Interstate Association's tournament, under auspices of Bellows Falls Gun Club. C. H. Gibson, Sec'y.
- June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.
- June 20-22.—Wheeling, W. Va.—Third annual tournament of the West Virginia State Sportsmen's Association, under the auspices of the Wheeling Gun Club, Wheeling, W. Va. John B. Garden, Sec'y.
- June 21-23.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under the auspices of the Sherman Rod and Gun Club. J. C. Porterfield, Sec'y, O. T. S. L.

June 27-29.—Altoona, Pa.—Target tournament of the Altoona Rod and Gun Club, Wopsononock Heights. G. G. Zeth, Sec'y.
 July 1.—Sherbrooke, P. Q.—Annual tournament; targets; Dominion Day; open to all amateurs. Chas. H. Foss, Sec'y.
 July 1-2.—Milwaukee, Wis.—Grand tournament of Milwaukee Gun Club, in Carnival Week. S. M. Du Val, Sec'y.
 July 4.—Pawling, N. Y.—All-day tournament of the Pawling Rod and Gun Club; targets.
 July 19-20.—Providence, R. I.—Interstate Association's tournament, under auspices of the Providence Gun Club. R. C. Root, Sec'y.
 July 18-20.—Little Rock, Ark.—Arkansas State tournament.
 Aug. 9-10.—Portland, Me.—Interstate Association's tournament, under auspices of the Portland Gun Club. S. B. Adams, Sec'y.
 Sept. 6-7.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.
 Oct. 6-7.—Pawling, N. Y.—Tournament of Pawling Rod and Gun Club; target and live birds.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The Noxubee Gun Club, of Macon, Miss., has issued its programme for its eleventh tournament, May 23 to 25, inclusive. The events will be at targets and English sparrows. Merchandise and cash to the amount of \$500 are promised. There are twelve events on the programme for the first day, of which six are at 10 targets, three at \$1.50 entrance; two at \$1.30 entrance and one at \$1. There are four 15-target events, two at \$2 entrance and two at \$1.75; one at 20 targets, \$2, and one at 25, \$3 entrance, completes the first day's programme. There are six target events for the second day, three at 10 and one each at 15, 20 and 25 targets. Six sparrow events, 10 birds, with a uniform entrance of \$2.50 completes the second day's programme. The third day is devoted exclusively to targets, eleven events, 10, 15, 20 and 25 targets. Three cents for targets and 10 cents for sparrows, deducted from purses. Class shooting, 50, 30 and 20 per cent., except when otherwise stated. Ammunition shipped in care of the manager, Mr. C. M. Scales, will be delivered on the grounds free of cost. Shooting begins at 8 A. M. The shoot is open to the world. Manufacturers' agents and experts will be handicapped, concerning which they are advised by Mr. Scales, to write to him if they desire to learn about it.

At the last medal shoot of the Memphis Gun Club Mr. A. H. Frank again won the medal with a straight score of 25. Frank has now won it three times, and according to the conditions, he now becomes the permanent possessor of it. Both of his other wins also were on straight scores. There were ten contestants, and the other winners were J. C. Neeley, Jr., who won twice on scores of 24 and 25; J. P. Edington had two wins to his credit, each on a straight score; Tom Divine won it once on a straight score, and W. H. Allen and Dr. Gragg won it once each on 24.

Mr. E. G. Horton, who has been preparing for a live-bird shoot on Saturday of this week at White Plains, N. Y., informs us that he is forced to declare the shoot off, owing to the scarcity of birds. He has been diligently seeking a supply for several days, and he informs us that a sufficient quantity cannot be obtained at any price, and only small lots can be obtained here and there. Rather than to have a shoot which would fall far short of the programme for want of birds, he regretfully declares the shoot off.

Under date of April 26, Mr. J. W. Babbitt, of Danvers, Mass., writes us as follows: "The Danvers Gun Club have held their annual meeting and elected the following officers for the ensuing year: Dr. E. H. Niles, President; E. H. Langdon, Vice-President; David S. Brown, Secretary and Treasurer; George E. Martin, Captain. Executive Committee: F. M. Spofford, Amos T. Killam, and the president, vice-president and secretary. The club will hold a shoot on May 17 and 30."

Messrs. Schoverling, Daly & Gales began moving into their new modern quarters, 300-302 Broadway, on Friday of last week, and expected to be doing business there on the following day. The new store has abundant space, and is most elaborately fitted in its details. Every department is so arranged that a full display of goods is visible. They sell everything in the way of sporting goods, so therefore some idea may be formed of the space they require for their mammoth stock.

Mr. H. B. Chase, of North Ferrisburg, Vt., writes us that at the annual meeting of the Lewis Creek Gun Club the following officers were elected for the ensuing year: Caleb Harrington, President; J. A. Cory, Vice-President; H. B. Chase, Secretary; C. H. Mallory, Jr., Treasurer; M. B. Thompson, Captain. Expert traps and blue-rocks are used. Several new members have been added to the club, and many a pleasant shoot is looked forward to for the coming season.

In our columns elsewhere is some crisp, ahead-of-date news concerning the place where the next G. A. H. will be held. It no doubt will be read with great interest by the Interstate Association, inasmuch as it determines matters ahead of the Association's official action. The Times-Herald, on trap matters, seems to be after the school of journalism which makes a home-made brand of news when there is no news.

There was a good attendance at the shoot of the Brooklyn Gun Club on Saturday last, and some good scores were made, the best being that of Mr. J. S. S. Remsen, who broke 15 straight and 5 pairs, in a 25-target event. He also took one of the special prizes. The other was won by Dr. Creamer, he having a close and hard struggle in the ties with Dr. Smith.

The next contest for the E. C. cup, emblematic of the championship of the State of New Jersey, will take place at Passaic, N. J., on Saturday, of this week. Capt. A. W. Money, the holder, and Phil Daly, Jr., are the contestants. There are several shooters ready to challenge the winner as soon as the contest is over. This is a very popular trophy, and bids fair to make interesting competition for a long while.

At the annual meeting of the Pawtuxet Gun Club, held recently, officers were elected as follows: Wm. G. Crandall, President; S. D. Greene, Jr., Vice-President; R. C. Root, Treasurer; W. H. Sheldon, Secretary; J. Armstrong, Jr., Captain; J. J. Crandall and A. B. Hawkins on Executive Committee, with above officers, comprising a board of seven. The club will hold shoots on Saturdays and holidays till October.

The live bird match between Messrs. T. W. Morley, of Lyndhurst, N. J., and E. Johnson, of Atlantic City, N. J., on Thursday of last week was rather a disappointment in the way of high scores. Johnson scored 87; Morley 81. The conditions were 100 birds per man, \$250 a side. The veteran Capt. A. W. Money refereed the match.

On April 25, on the grounds of the Keystone Shooting League, at Holmesburg Junction, H. E. Buckwater, of Roystersford, Pa., defeated T. J. Payne, of Philadelphia, in a match at 50 birds, \$50 a side. Score, 48 to 42. On the same date Messrs. F. Miller and H. B. Fisher shot a match at 50 birds, \$50 a side, the former winning. Score, 46 to 43.

The Brooklyn Gun Club, which is another way of designating John Wright, contemplates giving an all-day target shoot some time before May 15. Mr. Wright will endeavor to make it an enjoyable event, quite in line with any of his previous pleasing efforts in giving shoots. Special prizes will punctuate any good, surpassing performance.

Mr. W. H. Huck, secretary of the Boiling Springs Gun Club, Rutherford, N. J., informs us that the club will hold a Decoration Day shoot on May 30, and that there will be good prizes and plenty of them. It is a most pleasant place to spend the day, whether one shoots or looks on.

Three-in-one is becoming an universal article of use for the purposes for which it is designed; that is, a lubricant, a cleanser, a rust preventive. It possesses the sterling merit of being equal to all that is claimed for it. A trial is all that is necessary to win the firm confidence and permanent faith of those who need such an article.

We received the programme of the Peru, Ind., Gun Club's tournament last week after FOREST AND STREAM was in the mails, on its way to its host of readers. The date fixed for that tournament is May 2 and 3, Tuesday and Wednesday of this week. The programme, therefore, arrived too late to be reviewed.

At the Missouri State Amateur shoot, Messrs. Hollowell and Young shot a team race against Messrs. Gottlieb and Nauman, the latter team losing by one bird; score, 45 to 44.

In their team match at Wellington, Mass., April 29, the Harvard Shooting Club defeated the Yale Gun Club by a score of 117 to 110, five men on each team, 30 targets per man. Campbell, of Harvard, won the cup for the highest score, he finishing with 27, a 90 per cent. gait.

The Pawling Rod and Gun Club, Pawling, N. Y., has already begun its preliminary thinking about its tournament on July 4, at targets. It no doubt will be perfect in its arrangements. There is no pleasanter company, nor no pleasanter surroundings than those of Pawling.

The final match between the Hudsons and the Oceanics, owing to insufficient numbers present, was not shot. The Oceanic's last shoot of the season took place at Rockaway Park early this week. There was a good attendance.

The Hudson Gun Club is building a new club house on its old grounds, near Hackensack Bridge, near Jersey City, and contemplates a steady season of shooting in the future.

BERNARD WATERS.

IN NEW JERSEY.

Johnson Defeats Morley.

Lyndhurst, N. J., April 27.—An expedition from the southern part of the State of New Jersey arrived at Tom Morley's grounds at Lyndhurst, N. J., in the midday hours of Thursday of last week. A few had rolls of the circulating medium, while one of them had a gun. The latter gentleman was Mr. E. Johnson, of Atlantic City, N. J., and he was present to debate a little difference of opinion with Mr. Morley as to which was the better man at the traps. To show that there was no frivolity, each side put up \$250, which, with sundry other chinks of wealth, the gentlemen aforementioned quietly and calmly gathered to their possession, and took with them to their domicile. They conducted themselves in the most matter-of-course manner, as if the coming and the gathering in of the revenues and the deportation of the same were from long-continued habit.

The match itself was not a high class competition. There was very little wind, hardly enough to make any advantage to the birds, and what there was varied from 3 to 4 o'clock. The weather was clear and pleasant. The first 25 birds per man were quite a good lot, after which there were many very ordinary birds, with a few good ones mixed in. Many of the misses were from downright bad shooting, rather than the superior class of the birds.

Johnson shot a Scott gun 34drs. of Du Pont and No. 7 shot. Morley a Francotte, 50grs. of Schultze and No. 7 shot. Nevertheless, there were some fine shots made, as would be expected in a long contest by men of skill and fame. Johnson's 5th was a twisting right-quartering driver that required fine work to stop, while he was in great luck with his 6th, which struck the wire fence of the boundary as it pitched downward, and was saved. His 16th and 17th he lost, the latter dead out, finishing with 22, his 4th dying dead out also. Morley had an up-hill race from the start, losing two birds out of his first four, which lead he never entirely overcame, though he cut it down to one a time or two. Toward the finish of the race he lost ground. The scores were 87 to 81, thus Johnson won by six birds. The match began at 1:55. The first 25 required 30 minutes. The second 25 required 37 minutes. The third 25, 35 minutes. Capt. A. W. Money was referee.

Several miss-and-outs were shot, the chief feature of which was the fine shooting of Capt. Money and his son Harold, the latter shooting nearly equal to the form of his father, which is truly high form.

Freehold Gun Club.

Freehold, N. J., April 28.—I append the official score of the regular semi-monthly shoot of our club. We shoot from five blue-rock expert traps, unknown angles, rapid-fire system. Every fourth shoot will be at live birds. This is the first shoot of our new year, and in accordance with the action passed at our annual meeting, all men shoot from the scratch and without allowance:

Arrowsmith 1110011101110110111011101—23
 R A Ellis 1011011111101001010001011110—14

Rochester Rod and Gun Club.

In last week's shoot of the Rochester Rod and Gun Club Ed Meyer carried off the honors of the day. Six men tied in the badge shoot with scores of 25 each. In the shoot-off Meyer, Weller, McCord and Case won the four certificates. Meyer broke 58 targets without a miss. Scores:

Lane, 26..... 111110110111111111111011—23

The West End Gun Club is arranging to hold a shoot on Decoration Day. The Maple City Gun Club, of Hornellsville, claims the same date. The Rochester Rod and Gun Club will be represented at both places.

Woonsocket Gun Club.

WOONSOCKET, R. I., April 22.—The Woonsocket Gun Club held its first tournament of the season Saturday, April 22. The weather was unusually fine, and there was a good attendance of visitors. The Centerdale Gun Club was well represented by ten shooters and three or four spectators, together with the club scorer, A. W. Walls, secretary of the Worcester Sportsmen's Club, was present, besides shooters from Uxbridge and Burrillville. Leroy, the Campello expert, was there, representing the Du Pont Powder Company, and the Union Metallic Cartridge Company's ammunition. He shot a Remington gun, and made a remarkable score, missing but 4 on the entire programme of 120 targets. This raised the record of the grounds by several points. The scores by events were as follows:

Events:	1	2	3	4	5	6	7	8	Total.
Targets:	10	15	20	15	10	15	20	15	120
Walls	5	11	18	14	8	12	18	..	86
Reiner	9	12	15	12	6	9	17	10	93

Edwards	..	4	6	10
Bellou	16	7	23
Harris	4	4
Daniels	..	9	9
Callen	..	6	6

After the programme was finished, there were two extra events. The first was a miss-and-out. This was won by Campbell. Root and Reiner tied for second place, Getchell was third and Mills fourth, having tied with Slade. Griffith and Bain dropped out on the first round. Root and Reiner shot off their tie and Reiner won.

The second extra was at 5 pairs, doubles:
 Campbell 10 10 11 11 11—8
 Getchell 10 10 10 10 10—4
 Root 11 11 11 10 10—8
 Leroy 10 11 11 01 11—7

Shoot-off for first:

Shoot-off for second:
 Getchell 10 10 00 11 10—5
 Mills 10 10 01 00 10—4

ARNOLD SEAGRAVE, Sec'y.

Pawling Rod and Gun Club.

DOVER PLAINS, N. Y.—Herewith are the scores of our club shoot of Saturday, April 29, which also combined our postponed club shoot of March 25. It was, as the reader will see, a double-header. Our members have the trouting fever, which had the result of slim attendance. The scores are rather low on account of a strong south wind, which blew directly across the traps. We are going to give a tournament on July 4, all day. Liberal programme, on somewhat different lines than heretofore.

Members' cup, postponed shoot of March 25: Points.

I Tallman, 7.....	1101101101111101111111—21	20—41—7—48	5
H Lefurgy, 12.....	110111111111110111110100—17	21—38—10—48	4
F Fenn, 18.....	110100010110110110000100—21	18—29—7—36	1
E Foster, 12.....	11110011000101111101011—13	19—33—8—46	3
F Fry, 18.....	11010100010010110101010—13	16—29—9—38	2
H Nelson, 10.....	00110011011011110110001—15	18—33w	

Members' cup, April 29:			
Tallman, 7.....	11001111111101101111110—20	23—43—7—50	5
H Lefurgy, 12.....	111111111111110111110111—16	16—32—6—38	4

H Nelson, 14.....	10001011001100110010111—14	18—32—3—35	2

Postponed cash handicap, March 25:
 H Lefurgy, 10..... 19 6 25
 I Tallman, 2..... 19 w
 F Fry, 12..... 15 10 25

Lefurgy and Fry divided.
 Cash handicap, April 29:
 I Tallman, 3..... 21 w
 F Fry, 10..... 14 w
 E Foster, 6..... 21 4 25

Foster and Lefurgy divided.
 In the members' cup of March 25, Tallman and Lefurgy shot a miss-and-out of first and second, Tallman winning.

Harvard—Yale Match.

CAMBRIDGE, Mass., May 1.—The Harvard Shooting Club defeated the Yale Gun Club by a score of 117 to 110, in a team match held Saturday afternoon, April 29, at Wellington, Mass. The weather conditions were almost perfect, and there was a good crowd of interested spectators in attendance, including many well-known shots of Boston and vicinity. The match was very closely contested, and it looked very much as though Yale would win, until Harvard made a gain of 10 birds in the last round.

The conditions were five men on a team, each man to shoot at 30 targets, thrown at unknown angles. The cup for the highest score was won by Campbell, of Harvard, with 27. The judges were: Messrs. Dana and Spalding, with Mr. O. R. Dickey as referee. Dr. Langmaid and Mr. Alison were scorers. Summary:

Harvard.	Yale.		
Mallinckrodt	9	7	9—25
Kinney	9	3	8—20
Sanford	6	7	8—21
Bancroft	7	7	10—24
Campbell	10	10	7—27
41	34	42	117
			38 40 32 110

Trap Around Reading.

READING, Pa., April 26.—At the Three-Mile House shooting grounds, near here, to-day, Harry J. Coldren defeated Harvey Clouser in a 100-bird race, 28yds. rise, 50yds. boundary, Hurlingham rules to govern, by the score of 92 to 84. The birds were a poor lot, and of the lot Clouser drew the hardest birds. This match has been on for some time, but owing to different disputes they have had between themselves, it was only by hard work that they came together to-day. Arthur A. Fink, of this city, was referee, while Messrs. Brown and Schwartz acted as judges.

The score follows:
 Clouser, of Gibraltar..... 012121212*21112122222101—21
 21111112*02212*111112*1—21
 11*2112112211012111*2—22
 21*111*11*21121112211—20—84
 Coldren, of Reading..... 2111122122111112212211—25
 1221122122122112111002—23
 1111012111112210*12122—21
 2212122221220112121110—23—92

Highest run: Coldren 46.
 Spring City, Pa., April 29.—The Twin City Club held an all-day shooting tournament on their grounds here to-day. Edward Ridge, of Philadelphia, took the honors of the tournament, he making the best average.

DUSTER.

Missouri State Amateur Shoot.

KANSAS CITY, Mo., April 28.—The tournament of the Missouri State Amateur Shooting Association, under the auspices of the Washington Park Gun Club, was a pronounced success, notwithstanding that many unavoidable obstacles interposed, such as high water and unfavorable weather. The former no doubt kept many of the Kansas and Nebraska shooters away; for with the threatening aspect of all the rivers in this part of the country it makes railroad traveling very uncertain, as many of the streams are reported as being over their banks. This will naturally deter the prudent man from making any trip where he is likely to be prevented from returning home by an overflow.

However, those shooters who did attend this tournament went away pleased, I fell safe to assert, for it was conducted on the right line, as the programme was arranged so that the poorer shots had at least a chance for their life. The purse was so divided that when one shot into the money he at least received his entrance back, even though it was only fourth place. In speaking of this I refer to the target events of course, for I am frank to admit that the management erred in having four moneys in the 7 and 10-pigeon events. With such a division, it was rarely that any of the contestants were out of the money. In pigeon events of this kind high guns should prevail. Two moneys for every five entries would be a fair ratio, and I believe there would be nearly as many entries. This would at least enable the contestant who shot well to break even on the sport, while on the other hand, if he only kills 4 or 5 out of 7 he should not be entitled to any money. The management admitted the mistake, but very resolutely persisted in carrying out its programme, which is of itself commendable. The Washington Park Gun Club is composed of young energetic business men, and it is safe to predict, should they attempt to hold another tournament it will be even more successful than the present one. All of the members contributed their mite toward the success of this shoot, and to enumerate all the workers at this tournament it would be necessary to publish the roster of the club.

Annual Meeting.

The annual meeting of the Association was held at the Midland Hotel, and in the absence of the president and vice-president Mr. Herbert Taylor was called on to preside. Only five clubs were represented, and after some discussion it was decided to take no definite action in regard to selecting a place for the next annual meeting at present, but to meet again at St. Louis next month, when the Missouri State Fish and Game Protective Association will convene. An executive committee, however, was appointed which consisted of a member from each club, and which is composed as follows: Herbert Taylor, St. Louis Gun Club; Dr. E. R. Hickerson, Moberly Gun Club; W. H. Allen, Pleasant Hill Gun Club; Walter Howe, Washington Park Gun Club, and Chris. Gottlieb, O. K. Gun Club, both of Kansas City.

The sentiment seemed to prevail that there is really no occasion for the existence of this organization, and it has been suggested that it be merged with the parent one, which will most likely be done. Such an amalgamation would materially strengthen the older organization.

Present and participating: C. C. Nauman, San Francisco, Cal.; Harry Davis, Richmond, Mo.; J. W. Gulick, Brookfield, Mo.; A. B. Daniels, Denver, Col.; W. A. Smith, Greenwood, Mo.; J. S. Thomas and W. H. Allen, Pleasant Hill, Mo.; A. L. Devinney and T. Stevenson, Olathe, Kan.; Dr. J. C. Jones, W. G. Lytle and B. O. Running, Atchison, Kan.; H. L. Talbot, A. H. Barlow and Geo. Stevenson, Waterville, Kan.; A. Dixon and S. W. Bullock, Joplin, Mo.; T. A. Brown, Frontenac, Kan.; W. H. Koehler and J. W. Goff, Leavenworth, Kan.; Chas. Young, Springfield, O.; D. S. Gregg, Kingfisher, O. T.; D. W. Cooley, Oxford, Kan.; J. R. Wilmot, Lexington, Mo.; F. N. and C. B. Cockrill, Dr. S. Redman, Dr. A. D. Park and G. D. Park, Platt City, Mo.; Bud Freeman, Blue Springs, Mo.; Geo. McClure and L. S. Eddins, Sedalia, Mo.; G. W. Jenkins, Wamego, Kan.; W. S. Allen, Raymore, Mo.; Dr. C. B. Clapp and Dr. E. R. Hickerson, Moberly, Mo.; Paul Mellinger and Parhan, Wichita, Kan.

The trade representatives were Jno. J. Hallowell, Bridgeport, Conn., of the U. M. C. Co.; J. S. Fanning, Batavia, N. Y., Gold Dust Powder Co.; Paul North, Cleveland, O., Cleveland Target Co., who materially assisted the management by seeing that the target events and magaupr were kept going; Herbert Taylor, St. Louis, Mo. Du Pont Powder Co.'s representative.

The tournament was held at Washington Park, where all the trap-shooting of Kansas City is done. This park has been described in your columns several times before. The targets used at this tournament were bluerocks, thrown from magaupr.

First Day, Tuesday, April 25.

In the early part of the day most of the interest centered in the shooting of Sweet, who for several events kept grinding out straight targets, without any apparent effort whatever. He got through the first four events without a miss, but in the next he could not get beyond his 9th bird, the loss of which gave him a run of 68 straight. This excellent start enabled him to finish at the top of the list; not undisputed, however, as Gottlieb, who shot in his usual steady, unconcerned manner, managed to overhaul Sweet right at the finish, and thus these two are tie for high average with .935, a percentage that would do credit in the professional class.

Next to these comes Charley Young, 4 birds short of their total, and he is in turn closely followed by Hallowell and Koehler. Not only did Young shoot targets well, but his work on live birds was also of the best; for he and Besch were the only two that killed straight in the two live-bird events, which consisted of 17 birds. However, Young's run on live birds, 26, scored 9 more in the miss-and-outs that followed the conclusion of the regular programme. Young's miss did not occur until it was decided to go back a yard each round in order to settle this event. Then when the 33yds. mark was reached he came to grief. To Besch, though, goes the honor in the live-bird events, as his run is even two greater than Young's, being 28. His first miss had to be recorded when he was shooting at 35yds. This miss-and-out created no end of interest, for there were twenty-nine entries, and it was only possible to decide it by going back a yard each round, which began with those who had 7 straight to their credit. On the 12th bird the 35yds. mark was reached, and there were yet 5 straight, but here Nauman and Besch fell out, so the three remaining, F. N. Cockrill, W. H. Allen and Wilmot, divided.

The target programme consisted of nine 15 target events, and one, No. 6, at 10 pairs. The entrance in each was \$1.50. Then there were two live-bird events, a 7 and 10-bird shoot; \$5 and \$7.50 were the entrance respectively in these. The former had \$10 added and the latter \$15. There was also \$100 added in the target events. The weather conditions were perfect.

Events:	1	2	3	4	5	6	7	8	9	10	Shot	Broke.	Av.

Second Day, Wednesday, April 26.

Quite a number of new shooters put in an appearance to-day, and the entries ran much more uniform, this being evidenced by the fact that not less than thirty-five of the fifty-five contestants who participated in the target event, shot the entire seven events. Dr. Clapp, of Moberly, one of the new arrivals, seemed to be keyed up about right, so he proceeded to cut out the running for the balance of the shooters. He made but few skips, and in only one event did he drop more than one bird, finishing with a loss of 5 out of 110. Even so good a shot as Fanning had to be content to trail after the Doctor, and the best he could do was to finish second, 2 birds short of Clapp; whose average is .954, while Fanning's is .936. Gottlieb and Howe were the only straight men in the 20-bird event, but in the shorter races straights were numerous.

While the table shows but seven events, there was also a team race shot for the two-men team championship at targets. The conditions of this race were 25 targets per man, 50 per team, for the L. C. Smith cup. There were ten teams entered in this contest, but three of them shot only for birds, as they were not members of the Association, and therefore not eligible. The winners in this contest proved to be two local men, members of the Washington Park Gun Club—Walter Howe and Lil Scott—who put up the great total of 48 out of 50, each scoring 24. Next came Wilmot and Davis with 46, the former scoring 24 and the latter 22. The O. K. team—Gottlieb and Hickman—equaled this, as each of this pair had 23 to their credit. The scores of the other teams were: Sweet 22, Herman 22-44; Clapp 21, W. S. Allen 21-42; Taylor 22, Hickerson 19-41; Dave Elliott 22, F. N. Cockrill 17-39. The ineligible teams scored: Nauman 23, Fanning 23-46; Daniels 24, Hallowell 19-43; Koehler 20, Young 20-40.

There were two live-bird events on the card for the day, a 7 and a 15-bird race. The latter constituting what is known as the amateur State live-bird championship. The 7-bird affair showed the following results:

Clapp, W. S. Allen, Wilmot, Nauman, Daniels, Hallowell, Taylor, Rogers and Curtice, 7; Gottlieb, F. N. Cockrill, Wright, Beach, W. H. Allen, Young, Mellinger, Brown, F. J. Smith and Swiney, 6; Simms, Mennefee, Jarrett, J. B. Porter, Fanning, Redman and C. B. Cockrill, 5; Hickerson, Berkey and Riley, 4; Case 3; and McCurdy, 2.

The championship race showed three straights when complete—W. S. Allen, Gottlieb and F. N. Cockrill. The tie was immediately shot off miss-and-out. The O. K.'s champion, Gottlieb, was the first to drop out, as he could add but 5 more to his original total. The very next round brought grief for Cockrill, as he too missed. It now only remained for Allen to kill, and he was equal to the emergency. Those who killed straight received no part of the purse in this event, but next year they will share in a division of 50 per cent of the entrance money. On this occasion the former holder, Davis, received \$62.50. The balance of the purse, with the \$25 added money, was divided, Rose system, four moneys, among those whose score entitled them to a share of it. Under these conditions the 11s got in, and there was but one man out of the money.

The conditions of the event are 15 live birds, \$10 entrance, birds included, \$25 added.

The weather was dark and threatening, and a strong gusty wind prevailed all day, which added much to the difficulty of the target shooting. Fortunately, though, no rain fell.

W. S. Allen scored every live bird. He shot at 29 all told, including the two regular events and the tie.

All target events were 15 singles, with the exception of No. 4, and this was 20.

Targets:								Shot	Broke.	Av.

THE CONNECTICUT FISH COMMISSION.

THE rottenness of politics and the potency of pull have ruined before now many a fish commission in this country, and the latest instance in point is that of Connecticut. Gov. Lounsbury has committed an outrageous wrong upon the people of his State by debasing the fish commission into making it a berth for his political friends and cronies, irrespective of their fitness for the place, and regardless of the effect the appointment of incompetent individuals will have upon the commission's work and the important interests it is designed to conserve.

The commission as hitherto constituted consisted of Messrs. A. C. Collins, of Hartford; James A. Bill, of Lyme, and Hubert Williams, of Salisbury. Mr. Collins was the active man. He was thoroughly devoted to the work and did it in a sagacious and successful way which brought results. Years ago Mr. Collins won the reputation of being an energetic game protector, and he has had that name ever since. He believed that the game laws were laws intended to be enforced. He was convinced that the game and fish supply of Connecticut should be saved from the poacher, the snarer, the market hunter, the fish dynamiter and the trout netter, for the benefit of the community. He had the rare good sense to recognize that denunciation of "the farmer" was not the whole of efficient protection, and he set himself to the task of organizing the Connecticut State Association of Farmers and Sportsmen, an organization which enlisted the support of the land owners and for years was an efficient agency in advancing the cause to which it was devoted. Mr. Collins did this public service purely as an individual moved by large motives; and the reform he accomplished was one of far-reaching good throughout the State. His personal services were characterized by energy, fearlessness, common sense and a sort of bulldog tenacity, which made him a terror to the evil-doers in every county of Connecticut.

It was with most unqualified satisfaction, then, that the appointment of Mr. Collins to the reorganized fish and game commission in 1895 was received by all right minded citizens who were cognizant of the condition of affairs in Connecticut, and who felt assured by the appointment that the work of the commission would be done honestly, economically and well. That expectation was not unfulfilled. Mr. Collins applied to the work the most advanced modern fishcultural methods, which resulted in restocking the streams with trout and in restoring the shad to the rivers. If the business of the State were conducted as a private citizen would conduct his own personal business, retaining in its service those who had shown themselves to be efficient and valuable in advancing its interests, no one, from the Governor down, would have dreamed for a moment of dispensing with the services of Mr. Collins as fish commissioner. It is no credit to Gov. Lounsbury to say that his failure to reappoint Mr. Collins has not particularly astonished people; but the indignation aroused by his course is none the less deep and all pervading.

The terms of the Connecticut commission expired this year, and the only one of the members of the old board retained is James A. Bill, of Lyme, who through age and sickness is largely incapacitated. Mr. Collins was shoved to one side to make way for a man whose only claim to the place is found in his personal relations with the Governor. His successor is a Mr. Solomons, of Norwalk, a fishing companion and personal friend of Gov. Lounsbury, and reputed to know nothing more about trout than how to catch them. The third member of the new commission is a brother of Gov. Lounsbury's business partner. It would be difficult in all the range of rotten appointments with which the cause of fishculture has been cursed here and there during recent years to find nominations less defensible and more directly personal in the pull which promoted them than these two.

What Connecticut needs to-day is a single-headed fish commission in the person of a man versed in fishculture, interested in the work of fish propagation and game protection and qualified to perform the duties of the office. One such man, given the opportunity, could do more for the public interest of the community in one year than thirty commissions constituted as the Connecticut board is now made up could do in thirty years. It is of course useless to hope for any public redress from the Governor; he has committed himself and the State to a policy of foolishness. The Legislature, however, is still in session,

and if the citizens of the State who appreciate the situation and are moved by an honest indignation to have it remedied would make their influence felt, it might be possible to secure such a modification of the law as would make practicable the provisions of a competent commissioner.

BUSINESS AND SPORT.

WITH the return of business prosperity there comes a general and active revival of sport. It is a manifestation which demonstrates that the fondness of men for the pleasures of rod and gun is a constant and abiding quality, requiring only the ways and the means for its gratification to be at all times manifested. During the last few years there had seemed to be some weakening of interest in these affairs, notwithstanding that the pursuits of the rod and gun have been cherished by mankind from a time immemorial, and that human nature has not changed. There were many conjectures to account for the cause of this apparent defection; some attributed it to the rivalries of the wheel and golf and other engrossing pastimes; while there were those again who found the cause in the growing scarcity of game, the narrowing of available shooting territories and the insufficient and disappointing returns so often rewarding long effort and expense in search of sport. Few, however, considered the real cause, that which brings so much of dolor to a nation or a community, and colloquially is called "hard times." When revenues are cut down and retrenchment is the order of the day, the luxuries and the pleasures are the first to be curtailed or surrendered entirely. If the necessities of life exact all earnings, there is nothing left to be applied to sport.

The Grand American Handicap the other day was in its magnitude a suggestive index of the general revival of sport with the gun. Shooting at the trap, in all parts of the country, has taken a general impetus; and the sales of targets are something enormous. The demand for fishing tackle this season has in most sections been far ahead of that of the seasons of past years. The gun factories feel the general prosperity, and are taxed to their utmost to fill orders. People talk more of where to go and when to go; of what to buy and where to buy it; of the technique of the sport and methods of improvement; all this may rightly be interpreted as showing that the love of sport has only been held in check, and as soon as the check is removed the irrepressible love for sport on land and water, the heredity transmitted through the eons of time, bursts forth in undiminished ardor.

SOME GUIDES AND THEIR WAYS.

WE have adverted before now to the way some Maine hotel keepers have of recommending as guides incompetent individuals who happen to be in their debt for board, and who work it out in this way. The whole subject of the relations existing between the visiting sportsmen, the hotel or camp keeper and the guide might profitably be discussed; for there is no question that some features of the prevailing system are essentially adverse to the interests of the visitor. It would manifestly be a gross error to make any sweeping assertion which should apply to all resorts and all guides. Human nature in Maine is just the plain every-day human nature we find the world over. Some men are honest and some are dishonest. Men in the Maine woods have a living to make; and precisely as with other folks outside of the woods, some make the living honestly and some dishonestly. Premising that nine out of ten are honest, the tenth is so ubiquitous as to warrant our giving him some attention.

Among the numerous camps for sportsmen in Maine may now and then be found one which is conducted in a way not very different from the manner in which it would be conducted if its chief purpose were to sell as much whiskey as possible in a season. And there are guides whose chief intent appears to be to keep their "sports" within sound of the dinner horn of the camp to which they are attached. Ostensibly in the employ of the man from Boston or New York or Philadelphia or Chicago, they are actually in the service of the camp proprietor, and look to his interest first, last and all the time. Many an honest fellow indeed is in virtual bondage to the camp proprietor and the slavery galls him. He is not playing fair with the man he is guiding, and he knows it. When he tells his employer that old stock story that the fish are not biting to-day but they did last week, he lies, and because he lies he despises himself for the lie, and would get

out of the necessity of lying if he could. He cannot emancipate himself, however, because of his real or fancied double obligation to his two employers, with their diverse interests—the only interest of the camp keeper to keep the visitor at his own place, and the true interest of the visitor to go to some other place. As one guide has well put it, such a person has two fires to tend.

The evils here outlined are very real and very widespread. A correspondent who writes in our angling columns to-day tells us that his unfortunate experience has been always to employ guides with axes to grind. The remedy he had resort to was to study up his own fishing country, lay out his own routes and persist in pursuing them in the face of the protests of his guide. His experience appears to have made him impatient of all guides and distrustful of their capacity and honesty of intention, a conclusion, we need not say, unnecessary. There are many so-called guides who are lost the instant they stray from a familiar trail or get off from the buckboard road. But there are others who are competent and skilled masters of woodcraft, natural hunters, explorers and woodsmen, and who would be honest, too, with the man who employed them if they were accountable to him alone. They would be thus solely answerable to the sportsman if employed by him directly, without any intermediaries. The remedy of the whole trouble is to be found in direct employment of independent guides, instead of indirect employment through camp keepers. Then the guide will feel that he is answerable to the visitor alone; that he may serve the true interest of the sportsman, and not be in peril of the woods boycott. For there is a woods boycott. It works in this way: If the guide hired for the sportsman by the camp keeper does not exploit the sportsman for the camp keeper's benefit he does not get employment the next time.

A system of independent engagements between the guide and the guided would surely work to the benefit of the Maine visitor, and it would as certainly be welcomed by the guides and elevate the standard of the pursuit and the self-respect and responsibility of the men engaged in it.

BIGNESS.

THAT man George Kennedy appears to be a fellow of a delightful sort to carry on a discussion of pure science with. When he fails of other argument he calmly projects his rival up a tree, stations a frantic wild hog at the foot of the tree, and then wraps about himself pure philosophy as a mantle and lapses into sweet slumber. As for Mr. Kennedy's eye dilation theory of greatness there is much to be said in support, both as to the brute and the human. For proof of the magnifying power of the human eye, whether "subjected to certain lights," as Mr. Kennedy has it, or in the darkness of the woods, one would need only to cull from the rich storehouse of experience chronicled in the FOREST AND STREAM the thousand and one instances of hunters whose dilated optics have transmogrified porcupines into bears, beheld charging bull moose tremendous as rogue elephants, or seen grizzlies loom up big as barns. There is in common speech, in the proverbial expression "it's all in your eye," a recognition of this great scientific truth, the discovery of which is claimed by Mr. Kennedy; and as a matter of fact we may find many a record in the books illustrating the theory and demonstrating that it has long been known and acknowledged by the men of the wilderness.

Here, for instance, is an illustrative passage from the curious narrative of "The Shipwreck and Adventures of Monsieur Pierre Viaud" in Florida in 1776. Among what the French editor rightly terms the "shocking miseries" and "horrid circumstances" of Viaud's adventures were the nights spent in terror of wild beasts, concerning one of which the author writes thus, italics ours: "All hopes of sleep or rest, for this night, were now given over; our apprehensions were continually kept awake by the incessant howlings which surrounded us, and continued till morning; several bears approached near enough for us to distinguish their horrid forms, and some tygers appeared also in sight, which, perhaps magnified by our fears, appeared of a most enormous size; nay, there was one of them that advanced nearer to us than any of the rest, in defiance of our passive fire; but upon my darting several faggots at him he retreated, after having sent forth a most horrid howl, which was echoed back by all the other beasts of the forest."

The Sportsman Tourist.

Nicaraguan Experiences.—I.

GREYTOWN, Nicaragua.—*Editor Forest and Stream:* It has happened to me to spend a large part of the last two years in the little village of Greytown, Nicaragua, at the mouth of the San Juan River. Perhaps a brief account of a few things I have found strange may interest some of your readers, and the interest will be augmented, I am sure, if our delightful and much appreciated Mr. Fred Mather, or any other of your sharps in natural history, will kindly answer some questions which naturally suggest themselves in connection therewith.

This little village has about 1,200 inhabitants, and is situated about three miles from the sea, in the middle of endless swamps and lagoons.

Naturally, I brought lots of quinine, and I took some daily when I first came, but the town was healthy and I stopped it, and have never enjoyed more health and vigor anywhere in my life. I attribute the health of the place to the sandy soil. The site is low, averaging scarcely 2 ft. above ordinary tides, and the sand is dark colored, light and loose. It is, fortunately, too near the equator for hurricanes, for an 8 ft. hurricane tide, such as we sometimes have on the Atlantic and Gulf coast, would drown it out. Yellow fever has never been known here, and I attribute its immunity from this, and its general good health in spite of such inauspicious looking surroundings, to the sandy soil. Colon and Limon, which are on clayey soil, are much more sickly, and are both subject to yellow fever. Perhaps, too, the rains cut some figure. At Greytown there is practically no dry season, and the rainfall is anywhere from 200 to 300 in. I was told, before coming, that there was very little fishing, but that I would find at places our black bass of the United States, under the Spanish name guapote. But, when I saw on the map no end of beautiful, dark, deep lagoons and bayous, and thought how I would love to fish in such places, even if I caught nothing, I did not hesitate to bring no end of tackle of all kinds, and anticipations in proportion. But, to make a long story short, I've had to recognize that, practically, there is no fishing. I never saw so much beautiful water, in which a man indeed may fish to suit himself, but he will get no bites. And, in all the months I have been here, I have never seen a native man, woman or child try to fish from a wharf or in open water anywhere in river, bay or lagoon.

The reason seems to be that the waters are all under the dominion of two dreadful pests, sharks and zavalos. The sharks are of the ordinary tropical salt-water, man-eater variety, and there are plenty of well-authenticated instances of their attacking persons. And the first question I would like to propound to Mr. Mather is, what has natural history to say to sharks infesting these fresh waters, both of the river and of the lakes, one hundred miles inland, and no other lakes or rivers, greater or smaller, anywhere on the globe? Unless, indeed, it be true, as I have heard, that there is one other exception found in some river in Africa.

"Zavalos," meaning savages, is the native name for the other pest of the waters, which I think is even more destructive and objectionable than the shark. In build, scales and general appearance he resembles a thick and heavy built shad, but with a mouth and front teeth designed and patented apparently to bite a piece clean out of a man, exactly of the size and shape that the man himself would bite out of an apple. I never heard of their really biting such a piece from a man, but the mouth irresistibly suggests having been fashioned for that purpose. The natives, however, give them few chances, for, with both alligators and sharks to look out for, waters over knee deep are rarely ventured into. But the habits of zavalos are even more objectionable than his dentition. He is the most ravenous offal feeder that can be conceived of. Hogs, buzzards and wolves, all starved and put together, would be simply not in it with zavalos. They go in schools, not for sociability, but to fight each other for offal, and when any is thrown overboard it is almost terrific to see the knock-down and drag-out turmoil and commotion in the waters. But, with all their greediness, I have never seen any fish so wary of the hook. Fifty times I baited with raw beef, and threw among squads of them, fighting for kitchen refuse, but I never succeeded in getting a good bite. They would sometimes take hold, but quickly drop it. They can be caught, however, though they make the most desperate fight I ever saw.

One day, a deck hand on our steamer fixed a bait and caught one to show me. It weighed about 10 lbs., but I think I saw in the river some which seemed twice as heavy. I think the zavalos are largely responsible, in two ways, for breaking up fresh-water fishing in this country. First, they are in great abundance, and I don't see how any other fish can flourish in the same waters. And, secondly, their ravenous offal-eating cannot but disgust anyone who sees it with an idea of a fish diet from the same waters. The only fish supplied to market here seem to be salt-water fish, caught outside with a seine. If the scientists can offer any apology whatever for the zavalos—even a latin name—it will be gladly received and applied as far as it will go.

The majority of the market fish are mullet, though sometimes fine cavalli are caught outside. The mullet are generally the same that we have from North Carolina to the Gulf, but among them, occasionally, is a very fine large mullet, entirely new to me, and a most desirable fish if we could naturalize him. The natives call it "callipiver," and it is considered the best fish known here. In richness, flavor and delicacy it has, in fact, seemed to me fully equal to the shad, and it is without any troublesome bones. The few I've seen would run probably from 5 to 8 lbs. in weight, and I could see but little difference in appearance from ordinary mullet. But there is a difference to those familiar with them. I will consider a good botanical name for these excellent fish as a real personal favor.

Another fish I have learned to recognize on the table, the natives call mohara, but I haven't seen him in his scales, and I can only say that he seems to be a plain, light-colored fish, built like a sheepshead, and about 2 lbs.

average weight. I think that he is a salt-water denizen, but I do not know.

And now, I've left to the last the "guapote," which was said to be the same as our black bass. After hunting and fishing faithfully for him in vain, at many times and places, I am constrained to believe that there is no fish here even remotely resembling the bass. The fish which as always brought me as guapote is as unlike a bass as it is unlike a salmon. It is of, what I call, the perch tribe, with a small mouth and the build and size of beam. It is very dark colored; and if I had to name it I would suggest black bream. They are an excellent pan fish, and I would enjoy fishing for them if I could get at them. But, as far as I can catch on to their habits, and those of all the river fish that are good for anything—and there must be some—they can be found only in thick tangles of grass and roots, and such places, where no zavalos or sharks can get at them, and where naturally one's hook is forever getting tangled.

There, at any rate, are the only places where I have ever seen the natives fish. I have myself tried only on the edges of these spots, and on the edges have had no luck; while back in thick places the natives usually get some. I have tried several flies and varieties of artificial bait, but always in vain.

While speaking of fish, I had as well throw in the alligators and crocodiles. They are both here, as they are also in Florida, and probably in Louisiana and Texas. They are easily told apart, for the crocodile is web-footed and his teeth come together between each other, the canines fitting into notches in the jaw. The alligator's foot is not webbed, and the lower jaw is broader, and upper teeth fall inside of lower, but fit in notches in the upper jaw. The strange thing about both in this country is their scarcity and shyness, when one considers the suitable climate and immense extent of beautiful waters for them, the exceedingly sparse and scattered population, and the scarcity of firearms, even in proportion to the people. I have made several expeditions in waters that are very rarely visited, and, though on the lookout, scarcely seeing, on an average, one in ten miles. And those seen were all as shy as wild turkeys. About South Carolina rice fields they are certainly ten times as abundant and much easier to approach. I am disposed to attribute the shyness to the scarcity. I have often noted gregarious animals, when in smaller numbers than usual, exhibit marked uneasiness and increased suspicion. An instance of how this rule may work both ways, too, is readily seen in the wariness of a single mosquito, when compared with the onslaught of a swarm. If their shyness is merely an instinctive result of their scarcity, then the sharks and zavalos can be held responsible for the whole phenomenon, for I take it that they can catch young alligators and crocodiles even more easily than they can catch fish.

JACK HILDAGO.

Boyhood Days in Florida.

I.—Up the St. Johns.

WHEN one is turned loose at the age of thirteen years to roam and hunt over the rich luxuriant hummocks of southern Florida, to fish the ponds and lakes that dot the country from coast to coast—yes, to live with nature in her richest and most tempting garb—it is not strange that the impressions then made should last a lifetime. As I look back to that period so full of rare experience, of genuine happiness, all the youthful enthusiasm of my early boyhood comes back to me, and I feel once more the thrill of those glorious days. I am a youngster again, hunting, fishing, fishing, hunting from morning till night, day after day, tired and lame, with barked shins and blistered hands, yet happy—supremely and gloriously happy. It was not for me to know that I had been cast adrift, so to speak, as a last resort; that in such a life as this lay my one chance of securing health and strength to carry me safely through later life. I was not told that my chances of returning to my New England home were of the slightest. All I knew, or cared to know, was that for six months I was free—free to roam that mysterious land with all its hidden secrets, to hunt amid those tropical growths where lurked more kinds of game than my boyish fancy had ever dreamed of, to fish those ponds and lakes whose only fisherman up to this time had been the huge fish-hawk, the graceful heron, or the lazy alligator. Could a boy of my age ask for a better heaven than this?

And so it came about that late one night the train deposited me in the city of Jacksonville, where I was to take the boat for the upper St. Johns and Sanford.

The sun had scarcely risen the next morning when I found myself out on the broad hotel veranda overlooking the St. Johns River. The day was perfect and the sky without a cloud. A faint breeze wafted to me the new and delicious odor of orange blossoms from the yard below. Only a short distance away were the wharves about which the daily bustle and turmoil could just begin to be distinguished. Beyond stretched the broad silent river sluggishly moving toward the sea. Far away to the south it seemed to lose itself in the horizon. As I gazed out over its broad expanse all my boyish fancy was let loose. What had that unknown country in store for me? What adventures lay before me? Perhaps somewhere up that mysterious river bubbled Ponce de Leon's famous Fountain of Youth. Perhaps, in my wanderings, I should find it myself. Surely the air seemed laden with youth-giving elixir. And even as I queried a faint hazy streak appeared on the horizon. I watched it. By degrees it grew more distinct and I discovered that it was the smoke of an approaching steamer. What news would she bring of that country she had just left, and which in my impatience I could scarcely wait to reach? Was the game still abundant, and did the fish still bite? These and kindred thoughts filled my mind as I finally left the veranda and seated myself at the breakfast table. Little time had I for such trifles, however, and a moment later I was making my way to the neighboring wharf. The steamer was rapidly drawing near and soon its deep melodious whistle, full of significance to me, came booming over the water. Breathlessly I watched her as she approached and my delight knew no bounds when I made out, up on the pilot house, the name "Florida." Yes, that was the very boat that was to carry me into that un-

known country so full of interest and promise. I watched her make the dock and drank in eagerly the boisterous greetings of the darkies. I even felt a pang of disappointment when I learned that the trip down had proved uneventful. But then, didn't that mean that on the return there would be all the more chance of something happening? Possibly; at any rate, I would wait.

The boat was not to leave on her return trip until evening, and so I went back to stroll through the town; to stare in at the curiosity shops, and to gaze with undisguised interest at the beautiful plumages of birds and the blinking eyes of alligators. But, oh! how slowly those hours dragged by. It seemed as though that day never would come to an end. But at last the sun disappeared in the west, the mists began to gather on the river, and I made my way to the steamer, where, seated out on the deck, I waited impatiently for the journey up the river to begin. It was a peaceful time. Along the shore the lights flickered and blinked, while overhead the stars had never seemed so thick or so bright. Down on the wharf the darkies were busy hustling the last articles of our cargo on to the boat. They laughed and sang as they worked, their rich voices blending with the soothing influences of the night. I was anxious to be on hand when the boat should start out on her journey, and for a long time I struggled against the drowsiness that was slowly but surely overpowering me. At last I could stand it no longer, and, comforting myself with the assurance that the boat would not leave for some hours yet, I went inside and rolled into my berth.

It was broad daylight when I awoke. The steady thump of the paddle wheels and the corresponding vibration of the boat assured me that we were moving. I hastened on deck, where one glance revealed the fact that we had already come a long distance. The river was much narrower than at Jacksonville, and the country wholly without habitation. Again the old feeling of exhilaration seized me, and boy-like, I longed to let off my pent-up feelings in a wild shout. But I restrained myself and just drank in the glorious scenery and air.

As the day wore on the river grew even narrower; so much so that at times the boat had difficulty in making the sharp turns. Once she even poked her nose well up unto the muddy bank, and poles and boathooks were pressed into service to aid the engines in setting her free. As the river grew narrower the growth along its banks became more luxuriant. The huge cypresses laden with hanging moss, the palmetto trees varying from the tall sentinel that towered way above us to the little bush with its graceful leaves, the twining hills that overran everything mingling their leaves and branches in indescribable confusion, the gayly colored birds that flitted about among the leaves and branches—all formed a picture still fresh in my memory. I gazed until tired at the panorama that was constantly unfolding along the shore, and then leaning over the side of the steamer I watched the curling eddies of muddy foam that rolled and bubbled from under the stroke of the paddle wheels, rising into huge swells as they fell a little further back from the boat, and then stretching out into long slanting waves that tossed themselves against the banks, splashing the mud and water far up against the bushes that lined the stream. Occasionally a startled heron rose slowly from its hiding place along the shore, and stretching its huge wings, drifted lazily off into a more secluded spot. Or a flock of ducks beat a hasty and noisy retreat from a neighboring marsh. I wondered if there would be any more for me to shoot up in that unexplored country to which I was bound. I almost wished I had got out my gun and tried those fellows from the boat. Perhaps the captain wouldn't care. And then a bright thought struck me. Why not go down on the lower deck and ask the darkies for information? No doubt they could tell me all about the place. I would try them anyway, for between landings there was little work for them to do.

Out near the stern of the boat a group were idling away the time singing, dancing, whistling and laughing. Toward this group I made my way. For a time I merely watched them and listened to their songs and yarns. But at last I grew bolder and ventured a question—just a commonplace query as to the country through which we were passing. The jovial party proved to be just in a talkative mood, and soon in reply to my eager questions they were telling me all they knew, and a good deal more they didn't know. But at that stage of the journey I was not wholly capable of discerning truth from falsehood, though my suspicions were beginning to be aroused at some of the remarkable information so willingly offered. These suspicions increased as the time slipped by, but I was wise enough to keep them to myself, and as a result, I secured a most favorable glimpse of a typical Southern darky at his best.

And so the day faded away into twilight. The sun disappeared behind the thick foliage that lined the banks of the stream, and then a little later came that soft, rich after-glow peculiar to the Southern clime. The huge cypresses and lofty palmettos loomed up all the more conspicuously against the bright sky; the thick jungle along the shore seemed to grow denser, while even the birds ceased their chatter as though yielding to the restful peace and quiet of the hour. Scarcely a sound broke the stillness, save the panting of the steamer, the beat of the paddle wheels and the splash of the waves along the shore. And then the light faded away and river and land were wrapped in darkness.

Sanford was still several hours away when supper was called. The meal was rudely interrupted, however, by the approach of another steamer. No more supper for me. I hastened out on deck and watched the stranger draw near. She made a beautiful picture as she loomed up against the dark background of woods and sky, with her mass of sparkling lights, red, green, blue and yellow, while a cloud of black smoke just a little blacker than the darkness about her, poured from her funnel and rolled away in a long pathway behind until it finally blended with the night. She drew rapidly nearer. A deep melodious whistle boomed its greeting to us; ours answered; there was the tramp of paddle wheels, the swish and splash of water as wave met wave, the shouts of the negroes, the measured breathing of exhaust pipes, and the steamer with its noisy load and glimmering lights swept by us and disappeared around a bend in the river into the darkness and the night.

And now there was nothing to do but wait for the

boat to reach Sanford. The evening dragged wearily, but at last a noise on deck roused me from my lethargy, and I hastened out. We were evidently on a lake, and not far away the lights from a town cast their reflections out over the water. This was Sanford, I was told, and so securing my baggage I waited for the boat to make her dock. I took one last look at the old boat which had brought me thus far in safety, and then clambered into a rickety old barge that finally landed me at the hotel where I was to pass the night. Here I tumbled into bed to wait for the morning, and to dream of lakes alive with alligators, herons, ducks, and birds of huge and wonderful forms, and of forests teeming with deer, panthers, wildcats, turkeys and creatures that only dreams can create.

A. E. STEARNS.

A True Sea Story.

IN 1867 I was drifting about Callao, having left an American ship there after putting in nine months of as pleasant sea life as I ever experienced. I soon grew tired of my surroundings. Callao was an old stamping ground of mine, and I knew the ins and outs of everything.

Money was also getting low, and that convinced me, if nothing else would, that I ought to ship. I looked about for a day or two, and finally selected the English bark Meggie, Captain A—, bound to Dundirk, with guano.

The Meggie was an old-fashioned bark of 450 tons, C.M. A good sea boat and quite fast. Her crew were a mixed set, composed of English, Irish, Scotch and Welsh. I being the only American aboard. The Captain was a hard-headed old Scotchman, very fond of his grog, and not much regard for discipline. The mate, Mr. Jones, was a Welshman, a good seaman, and a gentleman, but with an ungovernable appetite for strong drink.

The second mate, or boatswain, was what sailors call "Liverpool Irish," a good seaman enough, but no officer. Old Sails, a French-Canadian, and Chips, a Scotchman, with two apprentices, formed the after-guard.

The crew forward were eight men, rated as follows, four able seamen, two ordinary seamen and two boys. To any one used to American ships this will appear a large crew, but it must be remembered that English ships carry one-third to one-half as many more men than the same class of American vessels. We got away on Feb. 14, and with a fine leading wind went to sea. Every one who has ever made a voyage at sea knows that the first few days are full of trouble. The men are all new to each other, and the ship is new to them. Then the deck is littered with the various odds and ends that must all be stowed away, or secured in their proper places. Battens and chafing gear had to be overhauled and put on. Anchors must be lashed on the bows, chains unbent and stowed below. Generally it takes a week or ten days to get settled and have everything going "ship shape and Bristol fashion," as sailors say.

On the Meggie it was much the same as other vessels of greater or less importance. In the course of a week we had got quite settled and were feeling at home. The officers were apparently all that could be desired, the food was very good and plentiful; the bark was easy to handle, steered like a pilot boat and sailed like a witch. What more could we ask? One would think we were as well situated as we possibly could be. A good ship, good officers, good crew, enough to eat, and watch and watch. But we were soon to find out that our good fortune was short lived. On the second week out the Captain came on deck the worse for liquor. The same afternoon the Mate showed that he too had been splicing the main brace too often. We all looked blue at this, no sailor but what dreads drunkenness at sea, and very few but what have seen serious effects from that cause.

Very soon it was noticed that when the Captain and Mate had both been drinking, they would play at cross purposes, one would give an order only to have it countermanded by the other. In fact, they seemed to lose sight of the welfare of the ship in the desire to irritate and provoke one another.

This, to us, was for a while amusing, but we soon found that it might bring us into circumstances which would be, to say the least, disagreeable.

One morning, when we had been out some three weeks, it came on to blow, and at 8 A. M. Mr. Jones commenced to shorten sail. The fore and main royals were quickly stowed, and we stood along quite comfortably with the wind a little abaft the beam.

At 9:30 the wind had increased so much that Mr. Jones thought it advisable to take in flyingjib and foretopgallantsail. The orders were given, but before a sheet could be started, the Captain sprang on deck with a roar, "Mr. Jones, what in h—l are you doing, sir. Don't you know we are homeward bound, and we want all the wind we can get."

"Aye, aye, sir," said Mr. Jones, "but I thought it was blowing a little too strong for that flyingjib."

"Well, sir," says Captain A—, "the Meggie can carry all she's got with twice this wind," and with a curse he staggered below. Mr. Jones soon stepped into his room, and when he returned on deck we noticed that his eye had an ominous glitter. "By G—," says he, "the old man may run the ship under before I offer to take a stitch off her." This was not very cheering to us, but we could do nothing.

About 11 A. M. the wind had increased to a gale. Captain A—, drunk as he was, saw that we must shorten sail. The orders were given to take in foretopgallantsail, down flyingjib and double reef the foretopgallantsail. The flyingjib and topgallantsail were stowed with some trouble; but when we came to haul out reef tackles on the foretopgallantsail, it was no go. The Captain would not luff the ship to the wind, and we could not get an inch on the reef tackles. Finally, I got all hands on the weather reef tackle, and tore the leech out the sail.

"Lay up there and send down that topsail," roared Captain A—. "Aye, aye, sir," and away we scrambled aloft.

The topsail was soon furled and sent on deck, and a new one was got from the sailroom. By the time that we were ready to bend it the gale had increased to such an extent that it was really frightful to look aloft, much more so to go there. But sailors, as a rule, only know how to obey, and away we scrambled again at the order,

Old Sails and myself on the weather yardarm. As I swung myself outside the lift to haul out the ear-ring, I glanced back at the maintopgallantsail; the sail stood out almost round as a ball, and hard as iron, while the stout spruce stick bent like a whip, and every moment seemed to be coming over on our heads. We finally secured the topsail, furled it and were right glad to once more get down on deck.

In a few moments it was "Clew up the main to-gallant sail," and after the hardest struggle that I ever remember with fluttering canvas the sail was clewed up and furled; that is, it was tied up somehow.

At seven bells we went to dinner. We had just gathered round our pea soup and hardtack, when there was a report like a cannon, followed by the flapping of torn canvas. Running on deck, we found the jib had split and was fast whipping away to leeward. As we stood looking at the fluttering rags, Bang! came another report. Turning, we saw the maintopsail sheets had parted, leaving about a fathom of chain on each clew. Flap! flap! bang! bang! crash! and the huge maintopsail thrashed the mast and rigging with its chain whips.

Capt. A. staggered on deck, and after a look aloft ordered the men to furl the maintopsail. Not a man would move. It was death to attempt going up the main rigging, and we all knew it.

After cursing the men the Captain reeled below for another dram, and we saw no more of him for a while. The maintopsail was new and of the best Russia duck, and it stood a terrible beating before the fur began to fly; but when once the foot of the sail gave way it went very fast.

The afternoon wore slowly away. We were all huddled on the quarter, watching the tufts of canvas flying away to leeward, and cursing the luck that led us to ship with a drunken skipper. At 4 P. M. I took the weather helm, with an ordinary seaman at the lee wheel. The bark was now running before the wind under a whole foresail and fore stormstaysail. This, with the remnant of the maintopsail left, barely sufficed to keep her clear of the following seas, which were racing after us at a fearful rate.

As I looked astern and saw the angry waves following us like hungry wolves after their prey, I could not help thinking the time was near when we could no longer keep clear of them. Their speed was increasing every moment, while we were going slower.

There is no danger in running before a gale as long as the ship can carry sail enough to keep out of the way of the following seas; but woe to the unlucky craft whom the sea overtakes. Many a good ship has been pooped by a sea and gone down with all on board.

I had just told the ordinary at the lee wheel, "Bargie, when you feel her stern lift, hold on for your life," when the sea I had been expecting came. Surging high over our taffrail, roaring and tumbling like a young Niagara, it fell upon our decks. For a few moments it seemed as if the ship must go down; but while we were nearly smothered by the mass of water on our deck, it proved our salvation. The ship was pressed down and her way checked. The extra strain split the foresail, easing the ship's head and letting her come to the wind. There was no time for thought, but with the instinct of preservation we did the only thing that could have saved us. In the momentary lull while the ship was wallowing with the mountain of water on her decks, we sprang for the mizenstaysail; a sharp knife clears the gasket, a dozen hands haul aft the sheet, and as the water rolls off our deck the little bark tosses her head to windward, and we feel that we are safe, for a time, at least.

But I shall never forget that night. None of us could sleep, or cared to try. The Captain below in a drunken stupor, the Mate as bad, and the vessel in a position where human skill could do no more. We sat or stood around in silence. Some tried to raise life enough for conversation, but failed miserably. Some tried to make coffee, but failed in that as well. 'Twas a long, weary night, but all things have an end, and so, morning came at last. The sun rose on a crippled vessel and a demoralized crew. When daylight came we were able to estimate the damage. The foresail, jib and maintopsail in rags. The starboard bulwarks between fore and main rigging gone, long boat stove, galley swept away, and all on account of a drunken skipper.

As the sun arose the wind went down, and by 12 M. we were once more under way and busy repairing damages. I have spent many years at sea and seen many severe storms, but was never so completely and thoroughly frightened as I was that night on the Meggie.

S. D. KENDALL.

TARPOON SPRINGS, Fla.

Our Chinaman Cook.

THE first week in September was a memorable one to a party of tourists who had just completed a most enjoyable camping tour of the Yellowstone National Park. This company, composed of a dozen or more of both young and old, had all the necessary equipment and provisions for the full comfort and enjoyment of this week in Nature's Wonderland, even to a good-natured Chinaman cook, who was familiarly known as Sport.

Sport's efficiency as a cook and his jolly amiability soon won for him the good will of the entire camp, especially of the younger members, who were much interested in his linguistic ability, and often he could be seen as the center of a group of these youngsters earnestly trying to pronounce words they were trying to teach him.

Besides his being the camp cook, the duty of guarding the camp provisions fell upon Sport. He took great pride in this office, and often showed the visitors his tent, where the provisions were neatly and carefully stored and guarded with jealous eye.

The necessary camp attachments, the huge log fire and camp stories were enjoyed every evening before retiring. One evening our guide pointed to some broken boxes and barrels, in which provisions had been stored, and some hungry bear had succeeded in getting them, and told of the night raids often made by bears. To allay any immediate fears which might be entertained by his hearers, he assured the company that bears would not enter a tent or molest human being; but if not themselves molested they only tried to steal meat and other

provisions. The women listened with ears and eyes wide open to this illustrated story and cast perturbed glances at the tent in which their loved ones were fast asleep. As most of the company were tired after the day's tramping, they went early to their tents, the mothers carefully locking or tying the tent flaps for the night. The reader can imagine how much, after hearing these stories, these loving mothers slept that night, with only a tent-wall between them and the wilds of beardom. As a natural consequence, now and then could be heard, mingling with the rumbling of the geysers, a tender, frightened voice: "Listen! Something trying to get in. Get up and scare it away." But this tremulous voice would be answered only by a groan and a snore from the husband. Then the supposed disturbance ceased and all was quiet for a short period.

Sport had retired to his tent earlier than usual and was entirely forgotten until the quiet morning air was stirred by the Celestial's cry of distress. A keen-scented and hungry bear had successfully located a sack of meat carefully sored away in the Chinaman's tent and was attempting to get it. Not finding an opening in the tent the bear soon made one to his own convenience by ripping a long slit in one side with his sharp claws. The opening made at the proper place, a large paw was inserted and grabbed the sack of meat. The noise of the ripping tent partly aroused the sleeping Chinaman, and when he saw the sack of meat disappearing through the opening he immediately grasped the situation, and with the howl of a Comanche Indian also grasped the other end of the sack. Then occurred a most thrilling and unique contest or tug-of-war of bear vs. Chinaman. The sack gave way and the contest was of short duration. The bear was evidently as badly scared as his yellow adversary, and compromised on half, taking only one ham and hurriedly disappearing.

When the aroused campers reached the scene of the catastrophe nothing could be seen but a much bewildered Chinaman holding a torn sack and dejectedly viewing the remains of the conflict, and gesticulating wildly in the direction of his retreating adversary.

The soldiers on guard in the Park reported next day that the cries of distress had been heard in their camp, half a mile distant. Sport's familiar twang was known to them, and asked him why he hollered so loud. "Me no wantee him takee mleeat," he said. And when asked if he was scared, "No, no, me no scaree; me scaree him," was the reply.

It was with the pride of a conquering gladiator that next morning Sport showed the evidence of his night's adventure. Not one member of the company missed hearing the exciting story, illustrated by the torn tent and the Chinese dialect, and succeeding visitors were equally sure to hear the tale from our efficient cook and faithful defender of the camp larder.

A. H. AMBROSE.

ILLINOIS.

"Pleasure in the Pathless Woods."

IN every issue of the FOREST AND STREAM we read accounts of many outings, and these are enjoyed by even the stay-at-homes and the couldn't-get-offs. Those who were doomed to remain behind are carried by these graphic accounts back to piny woods and sedgy lakes and trackless swamps; and the many happy hours spent there in pure and healthful sports. Visions of the big bag of mallards, or the stately stag that fell before one's true aim, or the long string of beauties that tried his bamboo, pass in kaleidoscopic review before the mind's eye of the man who has ever "been there." Unfortunately for themselves, there are a great many who can find no pleasure in these outings, and can't see what others can find in them. Time was, but is no more, when the man who had been out a day with his dog and gun or rod and bait bucket generally tried to sneak in the back way, as if he had been guilty of some disreputable act. To-day some of our best men love the sport, and the number is increasing fast. The pulpit, the halls of Congress, the White House, all have their advocates, who will unblushingly tell you how much they love the sport of rod and gun and rambles over marsh and meadow, in the swamp or through the virgin forest in quest of fur, fin, and feather.

The true sportsman does not measure his sport by the weight of his bag; he can find pleasure in pursuit as well as in possession. A jaunt in the fields in the early fall, when the air is crisp and so refreshing after the long and depressing heat of summer, making the blood course through the veins as though the elixir of life had been injected into them—how you enjoy it! How you enjoy watching your registered pointer or setter coursing over the ground. Suddenly he becomes as rigid as if carved of stone; you work up to him, and look with all your eyes, but you can't locate Bob White and his family, so cleverly are they hidden in the brown stubble. You walk into them, and with a great whirl they rise; you let go with both barrels and see a right and left go down, and your dog soon has them retrieved.

Or you rise at early morn, take your minnow bucket and fly-book, and are off to some cool and shady stream, where you know the wary trout lies. You tempt his appetite with a fine steelback; but perhaps he doesn't seem to want that. Then you try to lure him from his haunt with some gaudy fly, and at last you succeed. Like an arrow he flies to the alluring bait. He discovers his mistake; but, alas, too late. He makes the reel sing and bends the rod like a coach whip in his efforts to get away; but in the end good tackle and science land him.

These are healthful and restful sports. You come home with a better and healthier appetite than a dozen bottles of Hood's Sarsaparilla can give, and you don't need any of the pepsins to aid digestion, nor opiates to lull you to sleep.

The pleasures of camp life are many. You have the genial companionship, the pure air, the refreshing sleep, and rest for the entire system. These are Nature's own tonic for the world-worn. There is pleasure in the music of the baying hounds, starting the deer from his leafy couch; there is inspiration in the voicing of the pack hot on the trail. There is life in the honk of the wild goose, the quack of the mallard, the put-put of the wary turkey, the bark of the squirrel, the flash of the bass as it leaps from the waters in pursuit of its prey, and the glint of the sun on its glistening scales; in the splash of

the oars as they dip in the limpid waves, the whispering of the leaves, the curling smoke of the camp-fires, the stillness of the woods, that pervades all like the wooings of a pure and gentle spirit.

"These are some of the reasons that sportsmen can adduce to prove that man and nature are akin." In the stillness of the vast forest one seems nearer to his Creator than in the busy streets of the city; one feels his littleness; he sees how the Creator in his mysterious ways provides for all of these, his children, and loses not sight of any. It puts one in a frame of mind to be at peace with all the world. The nerve-racking race for the almighty dollar is off for a while. There is surcease from the demands of fashion. You come back from the woods a better man morally and physically. There is a spring in your step, a tan on your cheek, a sparkle in your eye that none of the much-advertised patent medicines nor your doctor's prescriptions can give you. A week in the woods beats a month at the popular watering places. The more of nature's tonic you take the less need you have for the M. D.

C. L. BRADLEY.

TENNESSEE.

The Origin of Dixie.

Editor Forest and Stream:

I have been greatly interested in the statements of Mr. Harris and Mr. Mather about the production of Dixie by Dan Emmett in 1859.

There can be no doubt that he brought out the song with Bryant's minstrels in that year; but was not the song built upon something older, perhaps even antedating "Coal-Black Rose" and "Old Zip-Coon"? The name "Dixie's Land" was certainly known to Mr. Mather in 1840. And I have some personal recollections which will scarcely go on all fours with any other supposition. First, I seem to remember the verses about "Old Mistress Married Will the Weaver," and "Simmon Seed and Sandy Bottom" as in an old song book that in the forties I much preferred to Milton, which, at the same time, we parsed at school. Next, I have a very clear recollection of the public performance which gave Dixie its vogue just at the time when secession grew into an actual issue, and thus accidentally led to its adoption as the Southern national air. It certainly was not the performance by Bryant's minstrels in 1859, but it was its introduction into a play called the "Japanese Embassadors," brought out at one of the leading theaters on Broadway about June, 1860.

In this play a bogus Japanese Embassy is requested to sing a Japanese song, and they sing Dixie. I happened to come to New York about this time, and was much with a relative, then living there, who was much older, and who was himself the greatest amateur on the violin I have ever met and with the most extensive repertoire. He certainly took me to see the Japanese Ambassador expressly to hear Dixie, which he evidently thought the gem of the play; and my recollection of the matter is that the very cream of the joke lay in the fact that Dixie was such an old, old song. I think I can remember his saying that he had known it very many years before.

Yet I know that recollections of forty years are not infallible upon points no more exciting and important than the age of a song or the book in which it was first seen, and I am prepared to admit my memory at fault if definite evidence can be produced. And it seems to me that the evidence of the person who wrote the play of the Japanese Ambassador ought to settle it. He will probably know whether he borrowed a recent production of Bryant's minstrels, or whether he revived a very old song. Surely some reader of FOREST AND STREAM in New York city can get access to theatrical records and find who wrote the Japanese Ambassador and who played in it, and can perhaps run this question down. The difficulty of doing so will increase every year, and it ought to be done soon.

I think the old slave holder near New York, whose name is perpetuated, was not named Dixie, but Dix. His land naturally was Dix's land, regardless of the spelling.

It was this play beyond all doubt which suddenly and quickly started all New York city Dixie-mad. Surely many others besides myself must remember the play and the quickly following popularity of the tune. From the city it spread everywhere like a conflagration. On Aug. 10 I sailed for California and Oregon by the Isthmus. Dixie had gone but a steamer or two ahead of me, and it became a regular joke with the passengers to hear it whistling, playing and singing at Aspinall, Panama, Acapulco, San Francisco, Portland and even at Victoria.

It struck the South in the fervor of the politics which led up to secession, and by chance the spirited air was already married in the chorus to words which exactly suited the temper of the people. No Southern poet or orator with a month to try in could have produced words to fit and express the burning sentiment of those days all through the South half as well as the accidental lines:

"In Dixie's Land I'll take my stand
To live and die in Dixie."

Those two lines of the chorus were the whole of the song to the South. All the rest was mere frame to the picture, and cut no figure, except perhaps the single line.

"Dixie's land is a land of cotton,"

which identified the locality. Ambitious poets in plenty offered new and patriotic verses, but no one would have them, and "Will the Weaver" still holds the fort. Naturally the air became a favorite on all special political occasions, and having been given a prominent place at the inauguration of President Davis in Montgomery, it was afterward always considered as the national air of the South.

Whoever wrote the "Japanese Embassadors" is the party responsible. But for him it might have been "Bonnie blue flag" or most any other old tune, and the chorus is what did the business.

JACK HILDIGO.

A second edition of the April number of the Game Laws in Brief and Woodcraft Magazine is now printing and will be ready immediately.

More about the Great Eye Theory.

Or the Eye Theory of Greatness.

Editor Forest and Stream:

Yours in reference to Mr. Kephart's statement that "the eyes of a man and the hog are the only ones which do not shine in the dark," and my statement that "the eye of an animal subjected to a certain light dilates and magnifies the terror in the inspiring object," and inquiring if "the university extension lecturers, the presumed source of our respective propositions, said anything about the dilation of the pupil of the eye of the fisherman in his long, lingering gaze upon the big one that gets away," came duly to hand.

Three inspiring questions are presented for reply. First, where did Mr. Kephart get his information? Second, can't a fellow contrive a way to cast discredit, doubt and contumely upon the discoveries of a rival investigator? Third, about the eye of the fisherman.

With the system born of a philosophic mind, I take up the last question first. Your happy suggestion is, I believe, the first rational explanation of this phenomenon in the spiritual world. Here were men of renowned probity in all ages obviously fibbing scandalously about the size of the fish that broke the leader or tore out the hook, and, until you spoke, the world could only look upon the spectacle as a psychic mystery, and upon you, their prophet, as, so to speak, the father of liars! In the light of our joint discovery the veil of suspicion is lifted from the fishermen, your people, and, incidentally, though reluctantly, from yourself. Henceforth we stand forth upon a probative equality with money changers, Lizzie boys and all other benighted creatures who do not fish. It only remains for some of the mere painstaking drudges of science (Kephart will do) to accurately determine the degree of dilation. Supplied with this information, which may appropriately be called "Sir Horace Kephart's Bi-Visual Theorem," proper deduction may be made of the optical illusion, either by the fisherman on the spot or by the man with the blue pencil in the FOREST AND STREAM office. For a while it might be better to leave this to be done at the FOREST AND STREAM end, until the fishermen and the people become used to the discovery and faith is restored.

I now take up the first two questions, as to Mr. Kephart's discovery. Let us first examine his method of reasoning in arriving at the result announced. In saying that the eyes of man and the hog do not shine at night, is it not clear that if he arrived at the discovery as to the one kind of eyes by scientific experiment, he reached the conclusion as to the eyes of the other animal by analogy? Wherein does this analogy consist? What subtle process of thought—what range of experience, either of his fellow creatures or of the other creatures—prompted or suggested this? The Rev. Sam Jones alleges a distinct line of demarcation between the two. He says that while a hog, when he grabs an ear of corn, will shell some of it for the chickens as he runs off, man does not shell any; he takes it all.

As to any element of scientific investigation which may have entered into the supposed discovery, I wish to ask Mr. Kephart in all candor whether he did not pursue such investigations in a swamp down in Arkansas; and if so, whether the hog in mind was not on the ground, and the scientist astride a limb of a tree at an altitude determined with scientific accuracy and attained with the fierce zeal of the enthusiastic searcher after truth? If so, we have in the point of view thus disclosed a possible solution of the whole question. The eyes shine, when they do shine, in terror; but was that hog in terror when it ran him up that sapling? Surely not. He was doing it for pure sport, and the mind can easily picture the two of them, Mr. Kephart as above described, and the hog with his front feet scratching the bark, and see which is having fun and which is only having a little vacation. Suppose the conditions were reversed, and that Mr. Kephart had chased the hog up the tree; would not he have had the laugh on the hog? And would he have had any cause for anger?

It appears, therefore, from whatever standpoint we assume the discovery to have emanated, there is something to be said in opposition to it. Of course Mr. Kephart can come back at me and tear my discovery to pieces, or try to; but I really do not see how he can do so. The beauty about my assertion is that it has the inherent perfection of exact scientific discovery. It cannot be disproved; at least only by the animals themselves, and they, so far as I have heard, are on the side of the affirmative.

GEORGE KENNEDY.

That Boy.

Editor Forest and Stream:

My friend the Adirondack boy has got a camera—one of the old film style—which knocked around the house for years unused, and just the kind for a lad to monkey with and fit up for plates as this one was, if he has that turn of mind. I told him he could take it on one condition; that he send me a picture once in a while. Occasionally he remembers, and his letters, when they stroll down this way, contain a photograph or two. One of these came last week, and possibly you and your readers may be interested to see exactly what a backwoods boy, of average pert in spirits, looks like. He tore off the sides of the picture, so there is no telling what was there, but it does not matter. This boy is a fair hunter, fisherman and all-round woodsman. He still-hunts the varying hare in winter with success, and is quick to capture trout in brook, pond or creek. His school work is in due proportion. The letter that accompanied the picture runs in part as follows:

"Shame has driven me to write. I am no good, or I would have written long ago. Better late than never (better never late, though) so I'll write a line for luck. We are in for a week's vacation—Teachers' Institute and all its glory. Every teacher in Jefferson county gathers here and every pupil breathes freer. The kids and girls have got to take them to their boarding houses (not I this time—some other).

"The leaves are just peeping out of their buds and the robins and other birds are carrying grass and stuff for their nests. It is well to have it spring again. I've killed

a couple of woodchucks so far, and some muskrats. Trapped two dollar an' a half mink above the trestle. I took a treble fish hook, small size, baited it with raw beef, strung out like a worm, and poured fish oil on it. Fixed the spring pole so it lifted down instead of up. That drowned the minks quick. I wanted to catch some skunks, too, only I'm afraid the school teachers and trustees and all the folks wouldn't like it.

"Say, don't tell my folks, because they would worry; but three or four weeks ago, while Clarence Crabb and I were trying to go up under the trestle to the traps, the nose of the boat went out behind the big rock there, caught the current and flopped us over at a hit-in-the-head gait. Of course we had to swim from the middle of the river to shore. There were cakes of ice floating along, and where I crawled out I dug my fingers into a

THAT BOY.

snowbank. I wouldn't have missed the fun for anything. All the damage was a lost chair and shrunk suits of clothes. It wasn't very cold.

"Gene Farnham and I went to the Plains, where I got my wildcat a year ago, after arbutus, on last Sunday. We got grape baskets full of the little sweet sweeters.

"You know how they grow—way down under the leaves, with the moles and worms—but look like stars in bunches when you dig them up. Wake robins are beginning to be out in full bloom, and hepaticas and spring beauties are all over in the shaded woods. Of course there are ponds of bluets forming all over along the river flats. Some of the boys and girls are planting beds of pansies so they can have button-hole bouquets, and be regular dudes. I guess I'd need several bouquets.

"Now, say. It is most time for bass fishing, and I'm going to try my luck. I wish you'd sort of see about some tackle, of which I haven't any to speak of—actually a piece of chalk-line, and hooks jin. long. Think of that for fish weighing a pound!"

With camera, rod and guns, boats, school and effervescent spirits and chums, what can't a boy do?

RAYMOND S. SPEARS.

NEW YORK CITY.

The Old Desk.

It's very old, and very shabby; and it's all inked up with spilled and spattered ink, and there are here and there dabs of mucilage from a knocked-over bottle; and in the center, on one edge, is the gap where some cheerful friend whiled away the minutes by whittling at the wood, to discover whether it was solid or veneer. He found out, but has never had another chance to gouge this particular desk.

Many letters come to the old desk, best of all those that gossip of the field and the forest and the waters. If one were privileged to look over the shoulder of the man who sits at the desk, he would find in these letters an open book of nature and human nature—a combination that is of never failing, never monotonous, never ending interest. Let us thus read some of the letters.

The Comradery of the Field.

How strong it is and all pervading many of us have found by experience. There is a testimony to it, in a letter from an Ohio correspondent: "I am sick, as I wrote you before. Last fall I went out on a camp hunt in hope of being benefited, and I was. My principal occupation was to sit on a log; and I found it a great art to do it well. I was out four weeks, and got one shot at a deer and killed it—first and only one of my life. I find the heart of a sportsman always open to a fellow, especially if the fellow is sick. Many a time have the tears come to my eyes, caused by offers of help to better sport by men who were strangers, but brother sportsmen after all."

Earth Sculpture.

The Putnams have recently published a work written by Professor Geike on "Earth Sculpture, or the Origin of Land Forms," in which is described the agency of water in its various forms, and other agencies in fashioning the earth's surface into the many forms we see about us, mountain and hill, plain and valley, river courses and shore lines, in the larger aspect; and the thousand and one varied details which present themselves on closer view. This branch of geology is one well worth our attention, for with some knowledge even slight of the general principles, we may find abundant opportunity to study out their applications in particular instances, and thus to discover the secrets of those processes by which the physical characteristics of the country we are in have been produced. The more the sportsman—shooter or angler—knows of geology, botany, ornithology, the richer is the store of entertainment and enjoyment opened to him in his outings.

But the man at the desk has been reminded of Professor Geike's books by this part of a letter which has come to the desk from Coahoma. As FOREST AND STREAM readers may remember, Coahoma holds the important position of chief engineer in charge of one of the Mississippi River levee districts; and what he knows about the earth sculpturing by the Father of Waters would fill a book, and it would be a book we would all like to read. Here is the letter; he writes from Clarksdale, Miss., under date of April 27:

Natural History.

Man and Brute.

Editor Forest and Stream:

I have been much interested in the arguments pro and con on the question of the reasoning powers of the lower animals. The very able contribution of Hermit in your last number is especially interesting. It appears to me that Mr. Wade falls short of the truth in one direction, while Hermit is perhaps a little too emphatic in the other, though to my apprehension, the latter has much the better of the argument. It occurs to me that before these two warriors couched their lances for such a resolute tilt against one another, it would have been well had the issue been more clearly defined. What constitutes "reasoning powers" in any kind of animal, man included? How is this function of the brain to be described in exact terms?

I believe the test of the exercise of reason lies in the syllogism. Man says, "If I drink this champagne I will surely have a headache, as champagne invariably gives me headache. I would enjoy much pleasure from the champagne, but the headache must be avoided; ergo, I will not drink the champagne."

Dog says, "I see a rabbit! What a jolly time I would have chasing that rabbit! But my master invariably gets angry with me when I chase rabbits. His anger must be avoided; ergo, I will not chase the rabbit."

Measured by this test, it seems that the operations of the man's brain and the dog's are exactly identical. Therefore, the dog exercises the powers of reason. Q. e. d.

In India, elephants have been employed to pick up heavy hewn timbers from a promiscuous pile, carry them some little distance and then stack them up in regular order. Here a still more complex syllogism is brought into play, which it is unnecessary to analyse.

An observer in India relates that he once saw an elephant approach a fence of bamboo pickets and break off the end of one. He then felt of the ruptured end of the fragment he had secured, and not suiting his purpose it was cast aside and another selected. This one stood the test, and the observer, curious to see what use would be made of the picket, was much interested to see the elephant reach under his abdominal region and detach an "elephant leach" that he was unable to reach with his proboscis. Here a plain syllogism is indicated.

I once saw Mr. Rooney, a noted chimpanzee in the Cincinnati Zoo, insert a stick into the lock of his cage door, endeavoring to use it as a key.

I also saw an old monkey in one of the cages holding out a bit of rag with one hand between the bars of his cage, inviting the spectators to seize it, and when the attempt was made the rag was withdrawn with great suddenness, and the adventurous hand was as suddenly seized by the other hand of the monkey, with very evident enjoyment on his part. This game was kept up until interrupted by the keeper.

It seems evident that in all these cases the brain process that we call "reasoning" was employed, the syllogism being clearly discernible. But the varieties of animals whose brain organisms are developed to this extent are quite limited. The reasoning faculties of the horse and cat, for example, are much more circumscribed than those of the animals above mentioned. In their cases, however, the syllogism in its simplest form appears as a feature in the process of ratiocination, though the premise is often mistaken. A rather vicious pet cat bit the writer severely on the hand with slight provocation. A severe whipping was immediately administered, the cat being unable to escape from the room. A reconciliation took place after a short lapse of time. The following day the same thing occurred, but the cat escaped from the room during the castigation. After that the cat was as ready to bite as before; but could never again be induced to enter that particular room, evidently associating the whipping with his presence in that room.

The writer's well-trained and docile buggy horse would always draw the empty buggy through a gate at word of command when held open for the purpose; but on one occasion when he ran a wheel against the gate post a little unpleasantness arose between horse and master. After that he could never be relied on to draw the vehicle through the open gate, but would turn aside into the woods or field. As in the case of the cat, the horse had not sufficient perspicacity to associate the true cause with the more impressive effect, but assumed a wrong cause. Still, a syllogism was present in the brain working in both cases.

There is a regular gradation of mental capacity, from the highest type of human development, down through a long diminishing series to the lowest; and the same gradation follows on down through the animal series, the diminution of mental power keeping exact pace with the diminishing complexity of brain organism, and this with very limited dependence upon mere volume or weight of brain matter; just as one electric motor of given weight and very complex construction will develop much greater power than another of the same weight, but with coarser wire and fewer convolutions.

The brain organism of the typical Afro-American is much less complex than that of the Caucasian. The former especially lacks the faculty of precision. Take an average Southern plantation negro; give him a 12-in. rule and tell him to cut half a dozen sticks each 15 in. long. It will be safe to wager that not one of them will be exactly of that length, nor even very near to it. It is asserted that a greater difference in brain organism exists between the African bushmen and the European than between the chimpanzee and the bushman.

Much has been said about the "missing link" between man and the Simian race. It has occurred to the writer that there is no ground between them upon which an intermediate type could stand. As soon as the ascending animal, who was at the head of the evolution procession, reached a point where he could communicate his ideas by a spoken language, he made an immeasurable bound away from the animal that could not talk, leaving a wide gap between.

The non-speaking animal, barring a limited line of inherited instincts, gained but little knowledge from his parents, but had to rely for his stock of information upon his individual experiences.

On the other hand, the speaking animal began his career equipped with knowledge derived from the accumulated experiences of his ancestors. So he was much further along at the beginning of his individual career than the former was at the end of his. Moreover, the free interchange of ideas through the medium of language was a powerful stimulus to the further development of brain organism in a seemingly endless process, whereas the brain development of the non-speaking animal long ago reached its limit, and stayed there.

The brain process that we call "reason" as between man and the higher animals at least appears to be a matter of degree only, with an intimate relation between its physiological and mental aspects.

That which is loosely called "instinct" and which may be briefly defined as inherited mental impulse, runs along as an undercurrent beneath the reasoning stratum of the more intelligent animals, including man, and even among those most highly developed, reason is occasionally dethroned temporarily, and instinct resumes its sway.

It is impossible to say at what point in the chain of animal development the rudiments of reason begin to overlie the pre-existing instinct. It is exceedingly difficult to exactly define the boundary line between instinct and reason. In a tentative effort I should express the difference in these terms:

Instinct is an involuntary, inherited, impulse, slowly augmented by persisting experience through many generations, excited in the individual by a repetition of the same experience that, having persisted through former generations, established its dormant machinery in his brain organism.

Reason is a self-evolved mental process, growing out of the more highly developed brain organisms in the instinct stage, the exciting cause being new experience, at first purely objective, but gradually merging into the subjective or self-contemplating and abstract, with increasing complexity of brain organism due to reactionary influences. See? COAHOMA.

The Dreadful Santer.

Editor Forest and Stream:

The other day I was talking with Dr. C. Hart Merriam, who is the most persistent and painstaking zoologist in America, about the wonderful accessions to our list of mammals during the past twenty-five years. Their name is legion.

Dr. Merriam has crossed and traversed nearly every State west of the Rockies on horseback, and has himself discovered innumerable new species and sub-species of rodents and mustelidæ, to say nothing of other creatures classed and unclassified, which fill up the notable indices of his collection. Many of these mammals are restricted to circumscribed geographical areas, and are local in their characteristics; but they differ so much in structure, size, habitat, sex peculiarities, and mutations of pelage that the consociation of naturalists readily accepts and recognizes them as variants, and labels accordingly (agreeably to the law of nomenclature) with the best approved Latin, which same being a dead language, is not only appropriate to defunct specimens, but favorable to cognomial uniformity. A scientific term means but one thing the world over, while a popular expression or synonym means perhaps one thing in a certain locality and in another two or three; and possibly nothing at all. For example, a gopher in New England is a chipmunk; in Minnesota a prairie rodent belonging to the *Sciuridæ*, or squirrels; in Florida a tortoise, and in Arkansas a snake. Scientific designation can alone determine which is referred to.

That the methods of the scientists are preferable to the loose vernacular of the hunters and wood rangers is proven by the difficulties which continually arise among laymen to identify creatures by the several names which are applied to them. Besides, the provincial names all the while change with the times and places of their usage, more surely than the nomenclature of the savans. A practical illustration is the recent attempt to discover the origin and significance of the word "sinnaker," as applied to a variety of swamp bears in sections of North Carolina, and so happily traced to the Iroquois Indians by the natural history editor of FOREST AND STREAM in one of its recent issues, thereby impressing upon the flippant and captious the conviction that names which often appear absurdly grotesque to the general observer are media of communication between men who are quite as wise as some other men, but educated in a different school, and should therefore command respect.

Right in line with this thesis comes the word *Santer*, a North Carolina synonym for panther in that section of the State to which the late colonists of Sir Walter Raleigh migrated from Roanoke Island in 1587-8, now embracing Mechenburgh and the adjacent counties. The names of the 117 men and women who were eventually absorbed into the tribe of Croatan Indians inhabiting that location have been retained by families until this day, through four centuries, and which likewise have many of their traits, habits and religious beliefs and practices; so that it is obvious enough that *santer* is a mispronunciation of the English word panther, which the Indians could not master any easier than the craftsmen on Solomon's Temple could the test word shibboleth, or a Chinaman the incorrigible barbarian letter R.

Santers are not numerous in that region, but they occur frequently enough to be a dreaded reality and not a myth. Indeed occasional specimens are found throughout the entire mountain region and foothills of the Appalachian chain, and only last July, in 1898, one was ravaging the hog-pens of Jackson county, in the Loxaway country, where I was residing.

Another interesting terror whose identity the mountain men seem not to be sure of, is what I believe to be the wolverine, glutton, carcajon, or Indian devil, as it is respectively designated in diverse parts of its habitat. Fred Mather describes its appearance and habits most minutely and correctly in his sketch of the French trapper Antoine Gardapee, in "Men I Have Fished With." Some

New Jersey's Ancient Game Supply.

The old narratives of exploration here in America in the early days, and the histories of the first settlements are perfect mines of FOREST AND STREAM lore. Here is a suggestive picture of New Jersey conditions in the times when there were only red men to hunt the game. It comes from a New Jersey correspondent, Louis E. Meeker, who writes:

In looking over a history of Elizabeth, N. J., I came across some very interesting information in regard to the early game and fish supply, and as it refers particularly to the regions covered by the wings and ramifications of Mr. Mather's net, I will quote a passage or two from a letter published therein and written in 1661:

"Marvelous plenty in all kinds of food, excellent venison. Elkes very great and large. All kinds of land and sea fowle that are naturally in Europe are here in great plenty, * * * the sea and rivers abounding with excellent fat and wholesome fish."

Denton also writes in part, 1670: "And how prodigal, if I may so say, hath nature been to furnish the country with all sorts of wilde beasts and fowle, which everyone hath an interest in and may hunt at his pleasure. Where besides the pleasure of hunting he may furnish his house with excellent fat venison, turkeys, geese, heath hens, cranes, swans, duck, pigeons and the like; and wearied with that, he may go fishing where the rivers are so furnished that he may supply himself with fish before he can leave off the recreation."

The passage above quoted, "which everyone hath an interest," etc., might be taken as a text for a sermon on game protection and preservation, for to have an interest in does not mean to kill everything in sight; although at that early period he could not have meant more than that the game and fish were the common property of the settlers whenever they could get them. The above shows what the country contiguous to New York once was. Now only a mere fragment is left, and is to be found only by those who know just when and where to go to get it.

LOUIS E. MEEKER.

In Colorado.

As for the texts for sermons, one finds them everywhere, and we need not go back to the old chronicles to discover conditions of superabounding game plenitude in districts now either wholly barren or where the remaining supply must be preserved, if it shall be preserved at all, by the untiring efforts of those who have the wisdom to appreciate the situation and the public spirit and grit to provide the remedy. The West is making wonderful strides in game protective sentiment and system. The FOREST AND STREAM has had much to say of the new Colorado game law. Here is an opinion about it from the pen of one whose opinions in such things are worth recording; and from a letter written by Mr. Wm. N. Byers, of Denver, we quote:

I think we have a pretty good game and fish law—that is, it is progressive, and that encourages us to hope that we may some day get proper and efficient legislation.

We have had a light flight of water fowl this season. I have not seen a flock of geese, and but few ducks. The small birds are very abundant and very busy building their nests.

I have no matured plans yet for the mountains this season, but expect to get there for some time—the more the better. The last winter has been the most severe I have ever seen here, and it was my fortieth. Weather very fine now and vegetation coming on well.

THE MAN AT THE DESK.

And May He Enjoy It as Long.

BROOKLYN, N. Y.—Editor Forest and Stream: Inclosed find subscription for FOREST AND STREAM for three years. I was for many years a subscriber, but the past two years I have not been. But I have a grandson, aged twelve years, and as he was looking over some FOREST AND STREAMS of 1888, he made the request that I again take the paper. I do it now, as a birthday present to him. And may he enjoy the same as the old man has done.

JOHN T. BATEMAN.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

credulous people believe it to be identical with the *Gyasticus*, but we leave that for the folk lore. In evidence of its presence in the Piedmont region of North Carolina, the Charlotte Observer made mention last February that some kind of large animal, something like the santer, which played such havoc with the dogs in Gredell county some years ago, "was killing dogs on Goose Creek, in the adjoining county of Union. And it adds: "The animal in question is certainly not the santer, for we have information from Mebane, Alamance county, of the appearance of this fright-inspiring animal there. 'Its color,' says our correspondence, 'is dark, its body is long and slim; so, also, is its tail; its ears are sharp; feet long and armed with great claws. It fears not the face of man, but comes boldly into his very yard, fights the dogs, pursues them even under the house, slays puppy-dogs, devours poultry, eats calves alive and gnaws the old cow's hoofs off. Horrible tracks mark the earth, and the night reverberates with its cry. Traps avail nothing. Cunning hunters come from near and far, but he smiles at their attempts to hunt him down. Benighted pedestrians flee for their lives. In short, terror reigns.'"

Both animals are unquestionably unpleasant living facts. Possibly our correspondents in the old North State can identify the last named as surely as we think we have done the santer.

CHARLES HALLOCK.

Strange Invaders.

WITHIN the last few years there has been quite an invasion of armadillos in this part of Texas. They seem to have suddenly taken a notion to extend their range from the prickly pear country in the southwestern part of the State. Until a few years ago they were quite an unknown animal here, but early in the nineties we began to hear of them occasionally, and in 1892 our hounds introduced us to one on the head of the Sabinal River. In '95 we caught one at the ranch, and since then they have increased so fast that they are now as common as opossums, if not more so.

Although they wear a heavy coat of mail, armadillos are not well provided with weapons of offense. They have no teeth worth mentioning, and their stout claws are better adapted for agricultural than military purposes. In disposition they are peaceable and confiding, and if they make an occasional raid on a melon or tomato patch, they more than compensate for any damage they do in a garden by the constant war they carry on against grubs and insects of all kinds. Even as the skunk places so much reliance on his defensive battery that he will scarcely take the trouble to get out of one's way, so does the armadillo rely upon its coat of mail, and I have known one, after being stopped and rolled over by a dog, to run a few yards to the next little thicket and calmly resume its occupation of rooting about among the fallen leaves. Their armor is a very efficient protection, and dogs as a rule don't hurt them much, as their teeth slip off the armed plates, and they can't get a good hold. Some dogs, however, learn to turn them over and get at the soft spots, in which case they kill them easily.

When deer hunting last November we used often to find them late in an evening, rooting and scratching about among the rocks, and dead leaves, and as I wanted to find out what they lived on I slipped up to within a few feet of one one day and watched him for half an hour or more. He was evidently after ants or their pupae, probably both. He would turn over the little rocks with his nose and root and scratch around the edges of the larger ones, eating something nearly all the time. I crawled up to within a yard of him, and still he did not find me out until he ran his nose against one of my shoes. He seemed to be much impressed by the shape or perhaps the size of my feet, for he sat up like a rabbit to see what the rest of me was like, and peered up at my face in a most ludicrous manner. This was a little too much for me, so I planted the toe of one shoe about where the third button of his waistcoat would have been had he worn such a garment, and he left the neighborhood in a most ridiculous kind of canter, jumping high but short, like a donkey, with his long, heavy tail flying up over his back every time he hit the ground. I gave him a few seconds to get over his fright, and found him again about geyds off, scratching about in another thicket as if nothing unusual had happened to him.

This is a rough limestone country, broken up into brush-covered hills and steep, rocky cañons, and abounding in caves of various sizes. The smaller caves just suit the armadillos, and they drag quantities of dead leaves into them and make snug nests for themselves. They don't like cold weather, and on frosty mornings we have often found them in shallow holes that they have dug for themselves, dragging in leaves after them and stopping up the mouth of the hole from within.

Armadillos have tremendous muscular power, and can turn over quite large rocks in their search for grubs. It is almost impossible to pull one out of a hole by the tail, and as soon as they realize that anything is after them, they try to escape by digging further in. When our dogs bay at a cave we always know when an armadillo is there by the noise he makes when digging. Two or three years ago, before the armadillos were as plentiful as they are now, we kept one for a week or two in an old box with a few slabs nailed over the top of it. It eat all the bread and milk it could get and was always perfectly tame and contented. One cold morning it seemed to be unhappy about something or other, and thinking that probably it was not warm enough, one of the boys threw a couple of flannel shirts over the top of the box. The next morning we found that our patient had pulled the garments through between the slats into his box and cut them up to suit himself, and although they were doubtless still very useful from an armadillo's point of view, they were no longer desirable as articles of human apparel.

When these animals first made their appearance in this part of the world they were quite unknown to most of our neighbors, and they are still looked upon with a good deal of suspicion. One of a party of deer hunters returning to camp after an unsuccessful morning's hunt met an armadillo and promptly blew a hole through it. The report of his rifle was heard in camp, and when he was asked what he had killed he owned that he did not know, but he "allowed" it was a rhinoceros; when asked why he did not bring it into camp with him, he said he

did not like to touch the thing; it looked "mighty pizenous." Another of my friends informed me lately that he supposed armadillos belonged to the turtle "species" and laid eggs.

I have never yet found any young ones, but a neighbor of mine who possesses many flocks of sheep tells me that his Mexican herders have twice found litters of four young and once a litter of five. The Mexicans eat all the armadillos they can catch, and they catch a great many. They say they are better than chickens. They also describe the young ones as being of a bright blue color. They sometimes find both parents with the young.

PURBECK.

KERRVILLE, TEXAS.

The Wild Pigeons.

MILLBROOK, Dutchess County, N. Y.—*Editor Forest and Stream*: I notice in your issue of April 29 an article written by Mr. A. O. Meersch that the wild pigeon had made its appearance again in Dutchess county in 1895. Having been a regular reader of FOREST AND STREAM since 1887, I have noted with interest all reports of the wild pigeon, as in fact all game birds. Reports frequently come that small flocks have been seen in Michigan or Wisconsin; but that they had appeared in such numbers in Dutchess county as Mr. Meersch describes I was greatly surprised to hear. I commenced to hunt in 1884, when fourteen years of age, and have hunted a great deal since that time over central Dutchess, and have not known of one wild pigeon being seen or killed in that time. In fact, I never saw a wild pigeon in my life. I have made several inquiries of the old hunters about here, and I find that the last wild pigeons seen or killed in this locality was about eighteen years ago. I have often had men tell me there was a flock of pigeons in such an oat or buckwheat stubble, but on going there I would find nothing but doves. I cannot help thinking that Mr. Meersch must be mistaken about the pigeons appearing in such numbers, so late as 1895, and about so many being killed in this county. I will await with interest the reports of other readers of FOREST AND STREAM in Dutchess county, as to when they saw or killed their last wild pigeon.

ISAAC TALLMAN.

ANN ARBOR, Mich., March 30.—*Editor Forest and Stream*: I read in FOREST AND STREAM for April 29 about wild pigeons as follows:

"Four years ago there was a remarkable flight of wild pigeons there, a flight like those of forty or fifty years ago. Hundreds were killed, and the event created no little interest."

In 1878 I saw a wreck of what had been a pigeon roost, and the piles of unused crates that were left by the butchers. In 1883 I had my last fleeting glimpse of a few of these birds in their arrowy flight from the reach of man. In view of the above quotation I am moved to make a few inquiries. Is there no good thing but a dead thing? Must every living creature be sacrificed to man's impulse to kill? Does nature afford no opportunity that can satisfy us completely, except the opportunity to kill something? Is the taking of life the only royal pastime? Let a flight of wild pigeons appear, and we seem to have an answer.

Witness also Michigan's spring duck killing.

J. B. DAVIS.

Florida Bird Flights.

DELAND, Fla., May 1.—It may interest some of your readers to learn that migrations of birds bound north passed over this section at least five weeks later than usual, few of them previous to April 1, and that scarcely any of these transients appeared to stop with us. I heard the first chuck-will's widow this season the first week in April, though I had heard the song of that bird about Auburndale in other years as early as the last week in February. The same difference of date was noticed in the first "bob-white" song of the local quail. The spring weather so far has been remarkably cool for this time in Florida.

DeLand is nearly four miles from the St. John's and is therefore slightly off the course of bird migration. Both this river and the Kissimmee are popular routes for the traveling flights. We noticed while out in camp near the Kissimmee on the night of Feb. 14, 1896, that large flocks of birds were passing overhead on their way North, and when we arrived at Palatka on Oct. 3, 1896, that as many of them were on their way South. But the latter flight in 1898 was not perceptible at De Land until about the first week in November.

H. R. STEIGER.

Puff Balls.

CARTERSBURG, Ind., April 29.—*Editor Forest and Stream*: I notice in your issue of April 28 an inquiry from N. D. E. as to the edibility of the common "puff-ball," and his apparent wonder that it should be used as food. The puff-ball, as described by him, while probably not equal to the cultivated mushroom in flavor, is one of the most delicious morsels that grows. It is claimed there is but one variety of the puff-ball, but in gathering them for my own table I have found some that differed from the ordinary kind as described by N. D. E. in both color and structure; but while these may have been edible, I have considered it safest to confine myself to the one variety that I know is good.

To have it at its best, the puff-ball should be gathered before it is twenty-four hours old, as it is of very rapid growth and soon ripens after it attains its maturity. The flesh should be crisp and solid, pure white and free from yellowish streaks, which are caused by a small white worm that sometimes infests it from the root upward. It does not matter how large the ball is, so long as the flesh is solid, and not soft and doughy. I have gathered them measuring 4 and 5 in. in diameter, and they were just as good as those not larger than a hen's egg.

I do not consider it necessary to soak them in salt water, but it does not injure them, except to take away somewhat the slight woody flavor that all wild mushrooms have. I have eaten them ten minutes after gathering them.

I have cooked them in but one way, and that is to fry

them. Cut the slices rather thin—about 1/4 in.—peel off the outside skin, rub them over with flour, and fry in sweet lard or butter to a light brown on both sides. Sprinkle the slices with salt or dip them in salt water before rubbing on the flour. Cooked in this way the puff-ball has a rich, nutty flavor that I have never found in any other mushroom.

ARTHUR M. DAVIS.

Quack and Quok.

THE FOREST AND STREAM makes me say the "quack" of the night heron. I wrote "quak," but should rather have written "quok," which is the nearest I can write his note. Quack, as we all know, is the note of the duck, and brings up memories of the days when two boys stood with longing eyes in the Hatfield meadows on the banks of the Connecticut watching the black ducks far out on the water beyond gunshot as they quacked and splashed and dove. Of the days when we lay behind the blind on the shore of the grist mill pond, wishing they would light, but they wouldn't. When we crept along the banks of the mill river only to see them put themselves out of gunshot before we could get near them. All this was before we learned wing shooting. And here I have the whirr of from two to a thousand wings as the companies of wildfowl pass northward or circle and curve about some prairie pond.

But the quok of the heron is of the night time, and brings up memories of the lonely watching for muskrats or fished for the grinning bullhead or squirming eel, and of the evenings when at the bidding of a certain sweet girl friend long since gone over to the silent majority, at the time when, on account of the pressure of farm work, the day time was, according to those having authority, too precious for such "nonsense." I would launch the little boat and go down to the silent, lonely pond where the pond lilies grew and gather these treasures for her especial benefit.

PINE TREE.

Weight of the Raccoon.

SOME one sends us a copy of the Ellenville, N. Y., Press of May 4, which has this item bearing on the raccoon weight question: Harvey Lake went to Brownville Sunday night to call on his best friend, and about 12 o'clock they heard the faithful dog, Jack, barking up a tree near the house on the bank of the Vernooey Creek. He called Arthur McComb out of bed, and the young men started to see what the dog had found, and great was their surprise to see a coon of enormous size in the top of a small tree. They both took hold and shook him out, and when he struck the ground the dog grabbed him in the neck, and a lively fight took place. But the coon was most too big for the dog to conquer alone, so Arthur grabbed one hind leg while Harvey latched him by the tail, and all four rolled down the bank into the stream. "Hang to it, Arthur; stick to him, Jack," said Harvey, "and I'll hang on to his tail until it comes off." After a good tussle in the water the boys secured their prize and also a good soaking. "Never mind," said Arthur, "we kept the coon." He was a fine fellow, and weighed 47 lbs.

The Linnaean Society.

A REGULAR meeting of the society will be held in the American Museum of Natural History on Tuesday evening, May 23, at 8 o'clock. The paper will be by Jonathan Dwight, Jr. "Remarks upon some of the April Birds of Georgia." By members. Exhibition of specimens, with discussion of distribution, habits, etc., of the species of the genus *Seiurus*.

WALTER W. GRANGER, Sec'y.

Game Bag and Gun.

The Rock Springs Elk Meat.

Editor Forest and Stream:

In your issue of April 8 I see that Mr. A. M. Gildersleeve, of Rock Springs, admits that the company used a few elk at their camps during the open season last fall.

As several of the local papers of this State have heretofore denied that the lumber company used any game and have applied to those of us that are trying to protect the game such epithets as "dudes," "tenderfeet," "outlaws worse than the Bannock Indians," and such like endearments, it is now a question of personal veracity between myself and Mr. Gildersleeve. This is especially the case now that Mr. Nelson, State game warden, says that Mr. Gildersleeve, Mr. Kendall and Mr. Biscom all denied to him any knowledge of the killing of game for the camps. Mr. Nelson says that my charges against the company are dictated by jealousy.

It is perfectly true that I run a camp for the accommodation of Eastern sportsmen. Consequently, if the Rock Springs Lumber Company kill off all the game I will have to go out of business. Therefore I will confess that I am fighting to save the game from interested motives.

I will now lay before the readers of FOREST AND STREAM the following facts, any of which I stand prepared to prove in court, leaving it to them to decide how far Mr. Gildersleeve's claim that he and Mr. Kendall are in favor of game protection is warranted by the truth.

The Rock Springs Lumber Company started their camps on Green River in September, 1878, and up until about the middle of December their entire crew of about 200 men was supplied with game.

Soon after the camps were established Mr. Live Simmons, a cattle man living on Green River, below the camps, went to Geo. Biscom, manager for the lumber company, and asked for a contract to supply the camps with beef. Mr. Biscom told Mr. Simmons that he did not want any beef, as he could buy elk meat much cheaper.

By October the company had from three to five hunters at work killing game, mainly cow and calf elk, for the camp. This killing was done openly and the game was taken into the camp in broad daylight.

Several sled loads were hauled down Green River by my camp and delivered at the log camps.

Along in the fore part of December several of the hunters for the company had established camps on Green

River above our camps. As they had taken possession of cabins belonging to our outfit, which we use as outlying camps for winter travel, Mr. W. F. Hill and myself went up to investigate. These men were perfectly open about what they were there for, and on our ordering them off, telling them that we would allow no hunting above our main camp, one of them said that he had been telling the boys all along that they had been too bold about the killing of game. In reply Mr. Hill told him that being bold or not made no difference, as we had the names of all the hunters, and evidence enough to convict them of violation of the game laws. These men made no trouble about going, saying that they were not looking for a row.

While these men were up the river one of them told that he had fifteen elk carcasses at one place in the woods, but as the company had cut down the price per pound he was not going to bring them in. For reasons which we thought good we did not attempt to prosecute either the company or the hunters before the Justice of the Peace at Big Piney. We had some thoughts of taking those of the officers of the company that we could get hold of to Jackson for trial, but it would have been a big undertaking to have hauled prisoners over the divide on toboggans. This fact is all that saved Mr. Gildersleeve and Mr. Biscom from arrest.

By the middle of December we had kicked up such a row that the company commenced to buy beef, though some elk meat was still hauled into their camps. All through the fall and winter some of the teams that brought up supplies for the company took back loads of elk meat to the railroad. Part of this meat was killed by men at the company camps, the balance by outsiders. This meat was taken to the coal camps of Dimondville and Kemmeser and sold, part of it being unloaded at Opal. At the hotel at Evanston elk meat was on the menu.

Along about the end of January, 1899, a team belonging to Ira Dodge, who was supplying beef to the logging camps, brought up a load of elk hindquarters and dumped them off at Boulder Creek, five miles below the camps. This meat lay there for some days, when a team came down from the logging camps and hauled it up. At this time there were large numbers of hindquarters stacked up at Cora, ready to be taken up to the logging camps, but so much attention was being drawn to the affair that no freighters could be got to haul them up.

I want to say flat-footed that if the Rock Springs Lumber Company had been let alone there would have been mighty few elk left on upper Green River to-day. It was a common saying that if the lumber company had the right to have elk killed everyone else had the same right, and the result has been that around Cora and below the biggest slaughter of elk that has been known for years has taken place.

It seems very strange that Mr. Gildersleeve knew nothing of this state of affairs. Everyone in the country was talking of it, the Governor and the State game warden were both notified, and when Mr. Nelson went to Rock Springs in November I requested him to see Mr. Kendall and have something done to stop the slaughter. This Mr. Nelson promised to do, but the only result that I have heard of was a letter to Jackson's Hole, saying that Mr. Gildersleeve and Mr. Kendall were high-toned gentlemen, incapable of any wrong-doing, and that I was talking through my hat, so to speak.

I am glad to say that we have been able, by direct threats, to save the elk herds on the head of the river. I moved about a thousand head of cows and calves back onto the Big Gros Ventre, in order that the elk should not be too crowded. Then, by keeping the elk driven up and the hunters down, we have protected the elk. After the snow gets deep the elk herds can be handled and driven like cattle. Consequently, anywhere between the Big Bend and the lakes one can now see big herds of elk sunning themselves on the south slopes, at peace with themselves and all the world.

I feel perfectly sure that no matter what has occurred in the past, the Rock Springs Lumber Company will from now on obey the law. But their good behavior will resemble that of the bad boy in the reform school; it will be a matter of necessity, not of choice.

WELLS P. O., UINTA Co., Wyo.

WM. WELLS.

On the Wing In Quebec.

SHERBROOKE, Que., May 5.—*Editor Forest and Stream:* Since writing you from Drummondville, Que., a few days since, I have had occasion to visit this thriving city, which is known as the metropolis of the eastern townships of the Province of Quebec. Gun clubs flourish and many fine shots have their residence here. Many of the city dwellers of the FOREST AND STREAM class are building cottages on Little Magog Lake, some eight or ten miles north of this city, where they go with rod and gun to pass the open season, as well as a part of the heated term. This lake is made from the expansion of the Magog River, which in turn is the outlet of the waters of the famous Lake Memphremagog, lying part in Vermont and part in Canada. At and in this city the Magog joins the noble St. Francis, the waters of which pass north through Drummondville, which is some seventy-five miles from here, and on till they join the mighty St. Lawrence River, near Quebec. The St. Francis years ago was one of the red men's great thoroughfares in this section of country, and where now is the thriving city of Sherbrooke, with its busy factories, electric street railways and four other railways, the Indians' wigwams used to stand almost within the memory of the "oldest inhabitant."

Since writing last to FOREST AND STREAM, I have visited Brome Lake, also Orford Lake, near Magog, and if reports were true, in the former lake large quantities of pickerel were being taken before the open season. That is to be regretted, as Brome Lake is one of the finest bodies of water for its size in this Province for fishing purposes, and is visited every summer by hundreds of sportsmen and summer tourists from Montreal, as well as from fifty miles in any direction, with an occasional party from Vermont.

I was also at Lake Memphremagog the present week, at and in the vicinity of Magog; there is good fishing almost every year and the fish warden has within a few months made trouble for several law breakers. There is also a fish hatchery here. This lake is some thirty miles

long and a fine steamer, the Lady of the Lake, makes a daily return trip between Newport, Vt., and Magog, Que., during the heated term, commencing generally its regular trips in June or July, and running till into September. The scenery is fine and the trip an ideal one to take.

On Monday of the present week, as I was on a train between Actou, Que., and Wickham, on what is known as the White Horn range of hills, near where the moose I wrote you about recently stopped the two men on a handcar, the engineer of our train gave the danger signal, which caused everyone to rush to the doors or windows of the train, and there were three fine deer beside the track running ahead of the train. They soon took to the fields and made for the woods, distant about one-eighth of a mile, scaling two or three high fences with the greatest of ease. I never saw a finer reproduction of a picture than the larger one of the three was to FOREST AND STREAM's recent supplement picture, "The White Flag."

The many lovers of Izaak Walton's sport are anxiously waiting the 16th, as they can begin to bring in their baskets of pickerel.

In closing allow me to say to your worthy correspondent Pine Tree that I surely did not intend my remarks on Bloody Brook to be slighting or offensive in the least, and I was pained much to find it so taken by him. I thank him for his historical remarks regarding that most painful episode and assure him that I can appreciate his feelings, as my ancestors back some three generations were of New England stock, though my remarks were somewhat awry regarding that painful Deerfield massacre.

WM. BROWN.

Happenings at Gassett's.

ONE occasionally comes across some queer specimens of humanity, so different from the common run of mankind that the circumstance makes upon the mind a lifelong impression. One of the queerest, and also one of the most shiftless of geniuses that we ever met, and we have run up against a number, was an old bachelor named Gassett, living out on an Illinois prairie a number of years since. He was one of the slowest moving persons we ever saw, and had such an uncommonly even temper that he seldom, if ever, got riled; but in spite of his abominable shiftlessness, by dumb luck and nothing else, seemingly, he managed to get and to hold possession of a large farm of rich, rolling prairie.

Having heard about that section as a first class prairie chicken country, we struck out for it with our hunting implements, and by chance coming across the old fellow, made a bargain with him for board and lodging, in consideration of his having the game that we got and also our assistance occasionally in his farm work. On these conditions we domiciled at his cabin for several months; and what we made by the bargain, or he did, we are unable to say, but this much we can vouch for, that we had a first class, jolly good time while there.

Once in a while, notwithstanding his usually good luck, things would pan out against him. One day a high wind, a bit of a cyclone, struck his farm, overturning a big stack of straw and killing an old horse and several pigs and sheep. "Waal," said he, "sence them critters had to get killed, it's mighty lucky it's done now in the fall, and not after they was all wintered through."

Being asked whether it would not be a good plan to dig the animals out from under the straw and bury them, he answered: "No-o, guess they are 'bout as well off under that stack as anywheres; too much work to dig them all out and then dig a hole big enough to put them all in." So the overturned stack was a sepulcher for the whole business.

Shortly after this Gassett decided to accompany us on some of our gunning trips, since we happened to be fairly successful in that line. So, to put his gun (an ancient, ramshackle, muzzle-loading affair) in order for business, he took it to the village smithy. Being assured that the gun was not loaded, the blacksmith, a very quick-tempered individual, started in to fix it. Wishing to remove the cylinder from the barrel, he removed the barrel from the stock, and placing the breech in the fire, began to pump the bellows, when bang! went the barrel, sending a charge past the smith and close to him, and blowing a big hole through his coat hanging on a nail near the door, and another hole about the size of the top of a teacup through the side of the shop.

"Thought you said the blasted thing wasn't loaded, you cussed old fool," said Vulcan.

"Tain't now," said Gassett in his most drawling tones.

Seizing the gun barrel and swearing a blue streak, Vulcan pulled it out of the fire and hurled it with all his might through the open doorway across the street and into an adjoining field. Then he told Gassett in language more forcible than polite that he had a great mind to pitch him out after his gun barrel. Gassett picked up the stock, went out and got the barrel, took them home and botched up the ancient fowling-piece himself, making it barely safe, and used it while we were there, and as good luck would have it, he didn't happen to get his head blown off.

But once during our sojourn with him, in spite of his usual snail-like movements, we did see him move about as lively as we ever saw anyone. And this is how it happened: At quite a little distance from the cabin were several hives of bees. As the hives were large and there were myriads of flowers on the prairies, the insects would naturally store up large quantities of honey; but Gassett would not use any of the honey himself nor let anyone else have it. When asked, he would invariably say: "Them bees'll need every bit of that honey to keep 'em through the cold weather."

Now, those big stores of honey were tempting to his housekeeper, and she often asked us if we would get some of it out of one of the hives and have the stolen sweetness all to our two selves. So one night—a clear, frosty, moonlight one in early November, a night so cold the bees could not fly—we proceeded with a knife and a big tin pan to rob one of the hives of great chunks of the full comb. Then replacing the hive and hiding the painful of honeycomb in the previously agreed-on place, we retired for the night.

The next day, which was a very warm one for that time of year, Gassett happened to pass near that hive just after noon; the bees swarmed out and pitched on him with a vengeance. With yelling and thrashing of arms,

and dancing, by some other sense rather than that of seeing, it must have been, he made a rush for the cabin, with a swarm of the enraged insects buzzing around and all over his bare head.

He was stung so badly that his eyes were closed for a couple of days, at the end of which time his head and features assumed their normal proportions. "I don't see what in thunder possessed them bees to pitch into me so," said he. "Guess they must have got mad about suthin or other, for I never got stung by 'em afore in my life." He never found out, at least not while we were there.

A. L. L.

CHICAGO AND THE WEST.

Wisconsin Game Law.

Wisconsin is making steps toward the higher walks of game protection. She has not absolutely prohibited spring shooting, but has come pretty near to it, allowing the killing of wild geese only. The license idea goes marching on in Wisconsin, and a \$10 non-resident license law was enacted, carrying the customary clause of a \$1 resident license. It is getting so nowadays that one can't travel around much in Western States on shooting trips unless he takes his check book along. The moral is obvious: Raise your game at home. As to the resident license, I question whether such a law can yet be very well enforced in our rural communities. The average farmer does not like to pay a dollar for every one of his boys who wants to go out after a rabbit in the cornfield. Yet all this is in the way of agitation and of progress. I imagine we will come to have excellent game laws, and very well enforced, at about the time we have no longer much game left to bother over.

The Lake Surprise Country.

We have often heard of the famous Lake Surprise canvasback region near Galveston, Texas, of which I made mention first in these columns some six or eight years ago. This is no doubt the best canvasback country left in America, although it has had many demands made upon it. A few years ago this country was bought up by Mr. Moody, a Galveston banker, and since then has been fairly well preserved, although the owner has gone on steadily marketing the canvasbacks. This week I received a call from Mr. Frederick Badger, of Boston, Mass., who, for three years, has spent some months each winter in the country near Lake Surprise, having written to me regarding this country before he went there. Mr. Badger tells me that Mr. Moody bought out Bud Stevenson's right in the Lake Surprise marshes for \$10,000, and got it cheap at that. My old friend, Bud, with whom I used to trot a friendly race now and then on jacksnipe, is now farming. Billy Griggs, the Northern market shooter who was in there at the time of my visit, has not been there for two years. The canvasback shooting last winter was not so good as usual, and the falling off is attributed to a singular cause. The half-wild hogs of that section are as fond of the wild celery root as are the canvasbacks, and these hogs will drive in 3 or 4 ft. of water and root out the bulbs. In this way a great deal of the feed has been destroyed, so that the canvasbacks have left the place in some degree. Mr. Badger says there are other lakes near by Lake Surprise, which are also leased, though not so air-tight as the Moody preserve. He says this region is only about thirty miles from the High Island country, on Cade & Co.'s ranch grounds, of which also we have heard in FOREST AND STREAM. This whole sea marsh is a great game country, and, as I remember it, it contained the greatest numbers of wildfowl that I have ever seen in any portion of the land.

Mr. Badger, by the way, though now degenerate and living in Boston, was at one time a Westerner, and lived in the good old Judith Basin. He also punched cows for awhile on the ranch of Governor Roosevelt near Medora, though Governor Roosevelt was not Governor at that time.

In Town.

Mr. W. H. Mullins, of Salem, Ohio, manufacturer of the famous Mullins metal boats, was in town this week for a day. Mr. Mullins is a big and fine looking man, but some time ago had the serious misfortune of breaking his knee-cap, an accident which came near making a cripple of him, and which for a long time prevented his shooting or fishing. He tells me that he is now just beginning to feel sure about this injured member, and is beginning to think about a Western trip after big game.

More About Gum.

Apropos of my recent story in FOREST AND STREAM on the gum hunters of the wild regions of the earth, I have to-day a letter from Assistant Commissioner J. H. McIlree of the Northwest Mounted Police, Regina, N. W. T., in which he remarks: "I saw in FOREST AND STREAM of the 8th inst., an article of yours on 'Gum.' I happened to see in a New Zealand paper an article on the Kauri gum industry, and thinking this might interest you, I have cut it out, and enclose it to you herewith."

The paper to which Mr. McIlree refers is the New Zealand Herald and Auckland Weekly News, and the article, beautifully illustrated with half-tone cuts, described very fully the wild business of gum collecting in that far-away part of the world. As I have taken great interest in this new sort of hunting, which seems the counterpart of the work of the trapper, the ginseng gatherer and perhaps the prospector, I cannot forbear going further into this subject than I was able to do before seeing the exhaustive handling which it has received in the journal just now at hand. Thus, regarding the age of this curious product, I read as below:

"The kauri gum industry is not only one of the most important industries in northern New Zealand, but is one of the most interesting in the world. Kauri gum is classed as a mineral, though in reality it is a vegetable product, being the resin which exudes from the kauri pine (*Dammara Australis*). It is found to-day, clinging to the trees in the forests of the north; it is found embedded in the soil on hillsides, and in swamps on country where not one tree is to be seen to the square mile, and where forests certainly have not existed for several hundred years; it is found in old swamp formations that have been covered by marine clays for at least four thou-

sand years, and it is found in the coal seams of the Waikato and the Bay of Islands fields, that are considered by geologists to be of the Jurassic period. It is not impossible that gum may be found in even older deposits than the coal measures, but older measures have not yet been explored. Reckoning, however, from present data, it must have existed over a period of 44,000 years. It is at least 300 years since the forests disappeared from much of the gum country. It must have taken the forests at least 3,000 years to grow and produce the quantities of gum found. It would take a long period after the marine clays rose above the surface of the water before soil could be formed capable of carrying forest trees. Then how long did it take to form the clays on which the forests grew, to say nothing of the older deposits of gum which lie in the ancient swamps beneath the clays? How many thousand years ago is it since the forests which produced that gum were destroyed and sunk beneath the sea? How long is it since those forests waved over a soil that is now in places below sea-level, and how much further back in the world's history since the kauris flourished that produced the gum found imbedded in the coal seams?"

The gum hunter of New Zealand would seem to be lured on in his calling by something of the sporting instinct which governs the trapper or the prospector. He has good days and bad days, and he always expects to find it better a little further on. He practices his art in different ways, sometimes ditching and draining swamps, underneath which the precious treasure lies. Sometimes he gets his gum by surface digging in the barren clay lands. Again he digs in the mounds which are thought to mark the resting place of some fallen giant of the forgotten forest. Yet again, he may dig deep, 40 or 60 ft., crossing different strata of gum, deposited in some mysterious fashion by agencies ancient and unknown. He works with spear and spade, and he works hard at times. Sometimes he goes out exploring for his gum in the forests of live kauri trees which still are standing in portions of New Zealand, working as thus described in the paper mentioned.

"The methods of obtaining gum are varied and even romantic. The more recently-formed gum is obtained by climbing the kauris as they stand in the forests at the present time. This is done by means of a long rope passed over one of the main branches of the tree. First, a strong cord like a fishing line, with a weight at the end, is flung over the branch. With this line the rope is hauled over and then a bowline is made in one end of the rope, in which the climber sits, and partly through his own exertions, and partly through his mates' lusty pulling, is hauled up to the branch. If the branch is a large one, it is very ticklish work getting on to it from the bowline, as anyone may know who likes to try. When once the climber reaches the head of the tree, it is comparatively easy for him to explore for gum, that is, if he is active and cool-headed. The gum is found generally in the forks of large branches, or where the branches join the main stem. Sometimes pieces weighing over a hundredweight are obtained, and either thrown or lowered to the ground. One good tree may give the climber several pounds worth of gum in an hour or two, and again he may climb many trees without getting more than a few pounds weight of gum. So persistent has been the search of the tree-climber that only in the wildest and deepest recesses of the forest do there exist trees that have not been robbed of their gum. As it takes hundreds of years to form the first large accumulations, a tree once robbed is not worth climbing for many years. But underneath all gum-bearing trees are to be found lumps of gum that have fallen in by-gone times. These lie hidden in the spongy soil."

Lonesome like the trapper, the hunter for the kauri gum none the less has seasons when he is gregarious, just as the early trappers of the Rockies held a yearly rendezvous. The trader comes to the kauri camps, just as he used to wander all over the Rocky Mountains in the early days to find the trappers at their rendezvous. Then there is hilarity and trading, and perhaps a few drinks on the side. Still more close is the parallel between the trapper and the kauri hunter. Even to-day in our Western pine woods the trapper who first locates a stream holds it as his own territory. If an intruder comes in, the first comer who finds his traps will content himself with springing them and leaving them alone. If on the next day he finds a trap set by the intruder, he takes up the trap, and springs it face down on top of the chain stake, which is a warning to the interloper that he would better pull out. This is the ancient law of the trappers, and we find a very similar one among the kauri diggers.

"There are laws and customs among diggers unwritten but immutable. If a man strikes a patch, no other digger, except on invitation, must come near him. If men drain a swamp, none others may dig without contributing. If a man clears a gully by fire, it is his to dig. If he sinks a hole none other may work in it until he deserts it. The spear stuck in the ground is a sign that gum has been struck there; and that gum is sacred to the owner of the spear. To keep these laws, and to break nearly every other law, save that of loyalty to a comrade and good-fellowship, forms much of the religion of the average digger."

As to Alaska Big Game.

Mr. Ezra E. Howard, of Edgar, Neb., writes me as below regarding the big game hunting described in Mr. Harry E. Lee's exciting story of his Alaskan experiences:

"I have been reading Mr. Harry Lee's account of his trip to Alaska and the hard work and the famous hunting he had until I feel—well, you know how it is yourself to be chained to business and not be able to go. I have had some experiences in hunting along the Northwest Coast and know that the hardships cannot be described, but would like to try Alaska, and mean to, some time in the future, if possible. I would like to know Mr. Lee's estimate of the cost of a trip there, not to put on too many trimmings, but just a plain hunting trip. What did he have to pay his men or guides? Can you tell me?"

I cannot tell Mr. Lee's whereabouts just at this time, for he travels much, but no doubt this will fall under his eye, and he will answer Mr. Howard on the points required.

E. HOUGH.
480 CANTON BUILDING, Chicago, Ill.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

For Temperance in Shooting.

STILLWATER, N. Y., May 3.—*Editor Forest and Stream:* Though I may stand with the minority in coinciding, to a degree, with Mr. Schenck; I do not think so.

I fail to see any ground for offense at a person who argues in favor of quitting when you have enough.

When a man bags a reasonable amount of game he knows it, that's sure. And when he takes more it looks to me like wanton slaughter, which it really is. The idea of a man killing a hundred ducks in one day, even though he hunts but once a year, is outrageous. His "enthusiasm" should be no excuse for such work.

Mr. Childress seems to maintain that it is no worse for a man to kill one hundred ducks in one day than it is for another to kill one hundred ducks in ten days. Now, I cannot agree with him, for a very similar comparison may be applied to other things as well as to ducks. Suppose one's family physician was in the habit of taking two large "horns" of brandy each day in the week; he would then be termed a moderate drinker. Then, suppose he changed his habit, concluding to take fourteen drinks every Saturday instead of two a day through the week. Would he then be considered a temperate drinker or an occasional "lusher"?

I never killed a deer in my life. Suppose, then, that I should go out next fall and kill as many as I would have been allowed to kill, according to law, for, say, ten years past, what would sportsmen recommend as being good for me? Small game needs to be protected from "enthusiasm" (Mr. Childress, apology) as well as the large. When their little hearts are stilled, no earthly power can set them performing their function again. That little dynamo of theirs lights all creation to them. I would say to all: Don't kill game birds just for practice. Get a trap and shoot "saucers" or balls.

I think the common laws of decency should be recognized even in private parks.

Mr. Childress says: "Game is the property of the people, and as such is not valued and preserved with a view to the delectation of some man or men who own guns. It has food significance of greater public value than a sport significance."

If Mr. Childress thinks game is worth more for food than for sport I should think, even then that he would be a more ardent advocate of its maintenance and propagation, and not applaud those hundred-a-day sportsmen.

Domestic fowl are excellent for food, as we are aware. Suppose some golf enthusiast owned a nice flock of one hundred chickens, and concluding that he wanted some broiled chicken, he goes into the yard, golf stick in hand, and "brains" about ninety-nine of them. Folks would think he had an awful appetite, if he was sane.

I wish to say of neighbor Schenck, as our American pork bears a fair reputation, he ought to be more particular in what class he puts the hog. Why not say game steer? That's the boy! CHAS. H. SMOELL.

Pennsylvania Fur and Feather.

GETTYSBURG, Pa., May 5.—*Editor Forest and Stream:* A number of sportsmen of York distributed fifty-eight dozen of partridges throughout York county, Pa., the last week in April. They were purchased in Wichita, Kan., and are a fine lot of large and strong birds.

A Hickorytown, Franklin county, man has started a rabbit farm and is meeting with much success. He ships the animals to New York market, where they find a ready sale at better prices than poultry.

About 20,000 small trout were sent to McConnellsburg by the State Fish Commission a few days ago and placed in Fulton county's streams.

There has been shipped to Philadelphia this season a vast number of hides of small animals collected in Schuylkill, Lebanon, Lancaster, Adams, Berks and Chester counties. One dealer in furs collected the skins of 8,000 muskrats, 250 mink, 140 red and gray fox, 250 coon, 1,250 opossum and other skins to the aggregate of 12,690. The average price paid for muskrat was 11 cents; mink, 75 cents; fox, 70 cents; opossum, 10 cents, and coon, 32 cents.

Senator William Scott liberated five German hare in the Gettysburg National Park, and as there is no shooting allowed on the ground they are sure to thrive very well. Two of them were put on Culp's Hill and three on Big Round Top.

F. M. BREMER.

Maine Caribou.

MAINE protects its caribou at all seasons, the close time running for six years from 1899. A correspondent, commenting on this, says:

The alleged reason is that the caribou are leaving on account of the supply of moss being exhausted. Now this law will not make them stay, if there is no food. I never knew a caribou to care for laws; they are a law unto themselves, and as the wind, "go where they list." We have in the eastern part of this State many hundreds of bogs and barren on which caribou used to feed, and which they have never revisited since their return, and which if they chose they could visit more easily than to go to New Brunswick. But the food was not exhausted nor a tenth part exhausted. The caribou in Maine could have lived here just as they live in Newfoundland. Moss grows just as grass grows, and the supply is inexhaustible; at least so far as needs of caribou are concerned. The only good the law will do will be to save some caribou for New Brunswick. They may come back, but the chances are ten to one that they will keep going and hunters will lose the chance to kill the few they might before they all leave.

It is the deer which are getting short of feed in some places; but there is plenty of room to spread. Ten years ago I traveled over many miles of country which the deer had deserted, though there was everything a deer could wish for, and since my recollection there had always been plenty there. They had not been killed, as I knew for sure; but simply had migrated. I notice that such things usually take care of themselves if let alone.

Bob White in California.

IN reading over a copy of the California game laws I notice that Bob White is protected, with other game birds. But I have been informed by the best authority that Bob White cannot live in California. Why, the writer failed to state, but he says that he liberated eight dozen Chinese quail on the Chino Ranch some years ago, but they soon all disappeared. The Bob White quail has been introduced into the eastern portion of Washington and around Moscow, Idaho, and I learn they are doing well. I truly wish they could be successfully planted in California. I would like to hear from readers of FOREST AND STREAM regarding the project. The question is, Has the Virginia quail ever been introduced in California? Did it thrive? If not, why not?

I learn that there are thousands of turkeys in the pine woods of Arizona, and I hope to soon see them on this side of the Great American Desert. I am somewhat of an enthusiast on the subject of game propagation, and hope that the shooting public may soon be persuaded to view the matter as I do, that the time may come when one can vary his sport as much as he desires, and that without spending a fortune in railroad fare.

REELFOOT.

As it is in Texas.

BEAUMONT, Tex., April 29.—*Editor Forest and Stream:* Inclosed please find stamps 25 cents, for which please send me a copy of Game Laws and Woodcraft. While I have met a number who pass as sportsmen in this State, I have failed to find a man who had a fair idea of the close or open season on any particular kind of game. They hunt when they feel like it, irrespective of law. Up to twenty days ago they were killing from 150 to 300 upland and golden plover to the team in a four hours' trip. The birds were very poor and out of condition, and 75 per cent. of the females are full of eggs, from the size of a No. 9 shot up to No. 2 or 1. The rule is to shoot everything, keep the best conditioned birds and throw the rest away. Now, as at least 75 to 80 per cent. of these birds are shot on the ground, where does the sport come in? I can't see it. I saw woodcock brought in last winter that were really unfit to eat, they were so poor. There is a good variety and quantity of game tributary to this point, if it is given half a chance.

BEAUMONT.

Sea and River Fishing.

About our Spring Fishing.

You see it is this way.

This is the way it is. The snow is pretty much mostly all gone on the flat, open lands, but on the north sides of the hills and in the woods there is enough to last all summer, unless the 4th of July comes round in time to "give it a sweat."

So it's no use talking; we can't get there next week anyway. And if we could, what would be the use? There are a foot or two of ice and several inches of water on top of it all over the lake. If the weather should continue nice and warm, the ice may possibly break up toward the end of next week, though I shouldn't be surprised if it didn't. I have known it to stay until almost the 20th. And after it goes we must wait a week or so before the trout will rise any. One year a young chap came up from Boston for the first open water. It was the 21st of May. He stayed three days and went home with only two insignificant rises. The next week the Professor came up and we got all the trout we knew what to do with.

Oh, yes. If we had fished with bait from off our landing stage, I don't doubt we could have got plenty. And good ones.

But we never do.

Only "the missis" has that privilege. She goes up in time to see the logs go down the discharge whenever she can. And they are a sight worth going a long way for, too. One can almost step over the stream when in its normal state, but when 10,000 logs have to be sent down in a few hours, it is another affair altogether. It is a splendid sight.

When the missis goes we try to have the Doctor go up too. He, being rheumatic and not caring much for fishing, is just the one to wait on her. To see the Doctor and his rheumatism run to take off her fish or bait her hook is worth the whole price of admission any day. The aggravating part is that she gets more trout and bigger ones than any of us. More than that, she claims that all those fish are hers, and she will send them to whoever she pleases. And she does.

The rest of us go out fishing a little while morning or evening, but she is a law unto herself, and steps down to the float and fishes whenever she takes it into her dear old head to do so. She is waiting now with as much impatience as any of us, for the time when the ice will be gone and the logs ready to go down.

The number of logs the lumbermen find to send out of that little lake year after year always surprises me. It was a tolerably well timbered country when they commenced cutting on it some thirty-five years ago, and logs have been made on it almost every year ever since. The continuous supply is largely due to the system of cutting adopted and always maintained, and is merely that of letting all trees below a certain size stand and grow. No trees under a prescribed diameter on the stump can be felled. The system is almost precisely that adopted by the Provincial Government on the immense extent of spruce timbered land owned by it, but more stringent and rigidly enforced. In my opinion the Government limit of size is decidedly too low. With the present enormous and increasing demand for pulp wood, as well as other, and with the present limit of size, this generation will see very large areas almost denuded of spruce. Two generations following would not be long enough to bring the timber back to its present value.

With this denudation the scientists tell us will come climatic and other changes. Game and fish—now so important to the Province—will greatly diminish.

These remarks refer mainly to spruce timbered coun-

try, which may apparently be relied on for perpetual reproduction if it has a chance, and is of little or no value for agricultural purposes. The system of cutting, however, with necessary modifications, may apply to other woods.

The Province is in the habit of speaking of its surplus of spruce as inexhaustible, but I have an idea that there are very few things that are really inexhaustible—if wasted.

I often think of the common saying of an old friend of mine, when asked to take another drink after he thought he had enough, "*Voyons! Il y a une limite toujours!*" As much as to say, "See here, there has got to be a stop to this somewhere."

But I am not going to try to run the Province of Quebec, and have strayed a long way from the lake and the ice and the trout.

On my way back I will tell an anecdote. On one of my spring visits home—to my real home I mean—two or three years ago, at a dinner party of gentlemen near Boston, I was seated next to one who has the preservation of our American forests very much at heart. He asked me to tell him about the Quebec system of limits and licenses, which I did as well as I could. Before I got through I found I had four or five listeners instead of one. My neighbor remarked that neither the United States or any individual State had so simple, efficient and economical a plan. Someone asked, "Why shouldn't we have a similar plan in this country?" to which some one else replied, "The power of the timber thieves is too great at Washington." I do not know whether that was the correct answer to the question or not, but as no one gainsaid it or gave any other reply, it had to pass.

The rods are in order, the fly-book O. K., the boats caulked and painted and the canvas canoes new varnished. There is nothing to be done now but wait.

G. DE MONTAUBAN.

QUEBEC, April 29.

Flare Fishing for Suckers.

TAMPA, Kan., April 22.—*Editor Forest and Stream:* It is a rainy day here in Kansas, and that means wet, cold, muddy and disagreeable beyond anything known at the East, where a rainy day was to me always a pleasure. But here the day drags, so I thought possibly a few words about a style of fishing that I used to consider great fun might not come amiss. I suppose the flaring up of a smoky lantern sent my thoughts backward some dozen years, for then the sight of a flaring torch and a shapely glittering spear was enough to send the blood tingling through my veins, and even now, although I am getting toward the years when Time's hoar frost will soon begin to mark me as old, yet if I were back on the old stamping grounds, I think a warm evening would find me among the familiar scenes along certain brooks that I know of.

The sucker is a plebeian fish, despised by the trout fisherman and hated, I suppose, by the fishculturist. But he is in the brooks to stay; and as when taken fresh from the chilly waters of the springtime brook, he isn't to be despised for the table, and best of all furnishes just about as much fun for the small boy (and for some boys not so small) as any other fish. I think he fills out the purpose of existence as well as the rest of us.

When the shad-blow began to whiten the woods with its snowy blossoms; when the shad-fly in great masses began to dance in the sunlight; when the little black-flies began to torment the horses, when we were at work near the woods, then we knew that all along the Connecticut the suckers were gathering at the mouths of the little brooks and would soon be on their way up to their spawning grounds. Then the spear, lying long idle, or only used in our mimic Indian battles, was looked up, its tines carefully sharpened, and its barbs cut deeper; the old torch, black and grimy with the smoke of many a nightly burning, was taken down; a file was placed handy by, and when word came that the suckers were running, some eager youngsters would be seen hastening to the delectable grounds. Beginning as near the river as the water would permit of wading, with hands trembling with eagerness as we heard the splashing of the fish on the riffle, the torch would be lighted, and with careful but eager steps we would advance into the water. Usually the fish first run from the deep waters of the river would be shy and wild; but as we worked our way upstream, soon close to the bottom of the brook would appear what to the careless eye would be only a stick or two of decayed wood, but the experienced eye would detect the fanning fins and slowly moving tail of a living fish. Then with bated breath we would raise the spear, poise it for a moment, and with a "chug" so familiar to the spearer, the first fish of the season would be thrown on the bank to the boy waiting with a gunny sack in hand for its reception. Then we could go on, picking up a fish here and there. Usually just above some deep quiet pool the light reveals some old patriarch of his tribe; but he has run the gauntlet of the spearers before, and so, instead of lying still as his younger brethren do, he turns quickly and makes for the deep water below, in his haste perhaps running against your feet, and even splashing the water into your face. But he is not of necessity lost. Go on with your spearing a few moments, then go back over the ground again, and probably you will find him in the shallow water carefully nosing his way upstream. This time you are on your guard, and with careful, stealthy step the light is gradually thrown about him, and with quick, strong blow the spear is sent home, and with a yell of triumph the old fellow is sent far up on the bank, where he lies panting in all his beauty of black and silver.

But the echo of voices and the flare of other torches shows that other fishers are busy, and that no time must be lost. Back into the brook again. An eel starts out from under the bank; he is quick and hard to get, and so with flying feet and arms, with cries of "Here he is!" "There he goes!" the spearers are after him. Perhaps they don't get him and perhaps they do. If they do, look out for the spear, for the eel, winding his tail around the handle, will try its metal to the utmost.

Further along you think you see one of the old settlers; so again, with strong, sure blow, the spear is sent

downward, only to strike the fishlike form of wood or stone, and to come back, if of poor metal, bent or broken; but if of good steel, with dulled points to the tines. Here the file comes into use, and soon you are pressing onward. But you reach the grounds where the others have fished; so putting out the torch and keeping the willows and alders of the meadow between them and you, with quick stealthy step you pass them, and again find the brook. Here is the deep pool formed by the old mill dam, and the light reveals shadowy moving forms deep in its waters, that you know are "whoppers." I have known those so cool-blooded that, with rubber boots on, they could fish night after night without wetting their feet; but I am of different temperament; for, although I would begin with all manner of good resolves, yet over boot tops, knee deep, waist deep, into the dark, chilly waters I would go after these fish. Then on upstream to where the fishing grounds ended. There, cold, wet and tired, and feeling as if fishing were not worth the while, we would go home; but only a few days would pass until night would again find us eager as ever on the fishing grounds.

It is not all of fishing to catch fish. There was the splashing, turbulent passing of the fish over the riffles; the diving of some startled muskrat; the sleepy cheeping of the birds, disturbed in their rest—and most of all, the tickling of the toads with a straw. Later in the season the toads seek the uplands; but now they are along the brookside; and if you want strong medicine for the "blues" look up Mr. Toad, and tickle his throat with a straw, and you will need no physician.

In sucker spearing, as with hook and line fishing, it is the big ones that get away. One time, fishing with a defective spear, the big fish of the season was by his very weight, as I lifted him from the water, torn off and got away. The biggest I ever saw was once at the head of a little pond, where I caught just a glimpse of what I at first thought was a stick of wood, but which at once took to itself fins and disappeared in the deep water, and I saw it no more. But a feeling of disappointment lingers with me even now as I write, because of that great fish.

PINE TREE.

The Maine Fishing.

BOSTON, May 6.—Fishing in Sebago Lake, Me., is still going on, though the season is not proving highly satisfactory, and a great many sportsmen go away without a fish. Still there are some successes, and these may be named. Mr. Field, of Bockton, with Mr. W. D. Brackett and Mr. Emerson, has taken a salmon of slightly over 17 lbs. weight, a very large fish for Sebago, taken with rod and reel. Mr. Brackett got three or four salmon of good size, one weighing over 8 lbs. Mr. Emerson did not fish much, but is interested in the new hotel at the Bay of Naples. Mr. Kendrick, of Boston, has taken a big salmon and one or two of smaller size. Mr. W. B. Saul, of the Sebago Club party, has secured a salmon of 13 lbs., with several smaller fish. Mr. W. T. Farley, of the same party, secured a salmon Monday that weighed 9 lbs. The record of the Sebago Club, up to Tuesday, had been thirty-eight trout and salmon. A number of "red-spots," as brook trout are termed at Sebago and Moosehead, in distinction from lake trout and landlocked salmon, have been secured in the vicinity of Muddy River and Kettle Cove, although the "redspot" fishing has not yet been first class in that lake. The ice is out of Sebago Lake, Me., but there are no reports yet of salmon taken. Cobbosseecontee, Maranocook and the other Winthrop, Me., lakes are clear of ice. One salmon of 7½ lbs. is reported from Maranocook, with a larger one from Cobbosseecontee. Mr. Carleton, of the Maine Fish and Game Commission, is reported to have taken the first trout of the season at Maranocook. H. E. Capen, of Augusta, has taken a number of trout from the Winthrop Lakes. J. T. Richards, in company with the Maine Fish and Game Commissioners, making an early visit to the Maine trout and salmon waters, takes home a salmon of 6 lbs. Very little fishing has yet been done at the big salmon pool at Bangor, the water still being remarkably high from the melting snows above. Still, some good fishing is looked for there when the waters do subside. All the Maine rivers are still swollen to almost the freshest pitch, and brook fishing has scarcely begun.

The ice still hangs in the Rangeleys and Moosehead, though the warm weather of a week ago made great progress in dissolving it. But the actual freeze of Wednesday and Thursday has retarded progress greatly. Careful estimates now put the departure of the ice from those waters at from the 10th to the 15th; but all depends on the weather. The ice went out of Lake Auburn Sunday, April 30, several days later than last year. Fishing immediately begun, and every available boat has been in use almost ever since. J. Murphy made about the first record with a salmon of 7 lbs. James Tracy has taken two salmon. G. J. Merrifield, F. Jackson and P. Record have made catches. Supt. Stanley, of the Lake Auburn fish hatchery, says that there are lots of fish in the lake, and a good season's fishing is to be hoped for. Mr. P. H. Dingley caught two good trout in that lake on Monday. Mr. B. Atherton and Mr. Fowler, of Lewiston, have been to Cobbosseecontee fishing, and take home several good trout.

Dispatches say that the ice has left Carry, Row and Pleasant ponds, in northern Somerset county, Me., and that the trout fishing promises to be excellent. Reports are conflicting as to whether the ice is out of Grand Lake, Me., at this writing, but several Boston fishermen are on the way there, and expect to find the ice out. Newfound Lake, N. H., is not yet clear of ice, but doubtless will be ere this reaches the eye of the reader. Boston fishermen are interested, since good salmon catches were made there last year, as well as catches of big lakere.

May 8.—The Cape Cod trout fishermen are bringing home some better strings since the warmer days and bright weather, but already there are reports of low water in some of the best streams. Pickerel fishing in Fresh Pond is now in order. It will be remembered that this pond is a source of supply or reservoir for the City of Cambridge, and hence under city control. Formerly no fishing was allowed there, though well stocked with pickerel, but of late it has been decided to allow two persons to fish there in one day, under special permit.

Mr. E. C. Stevens and Mr. Tausig had a permit for one day last week, and had good luck, taking eight pickerel, one of 3½ lbs. They mean to try the same waters again.

The telegraph has not yet announced the clearing of Moosehead, Me., of ice, though the news is hourly expected, since the ice had left the coves on Friday, and some of the bays were clear. Neither are the Rangeleys clear. Mr. W. S. Marble, of the Rangeley Lake House, who has had years of experience and observation at that point, under date of May 6 writes that the ice is out of the coves, with the water in the lake the highest he has ever seen it. "But taking all conditions into consideration, I do not think the ice will leave before May 15." Webb Lake, Weld, Me., is clear of ice, and good catches of trout and salmon are reported. Over 100 trout and salmon are reported to have been taken on Monday, while the record of Tuesday was not far behind. The size of the fish taken this year is reported to be better than last, especially of salmon, and this is also true of Sebago and other waters. Commissioner Stanley is of the opinion that the salmon are growing rapidly. Messrs. P. O. Vickery, of Augusta; Fish and Game Commissioner C. E. Oak, of Caribou, and A. S. Hinds, of Portland, fished Lake Auburn one day last week. Mr. Oak took a salmon weighing 10 lbs., the only success of the party.

Brook trout fishing in Maine and New Hampshire is reported to be excellent in all the brooks where the snow water is about done running. This pertains only to the more southerly portions of each State, however, since there is yet a great body of snow in the North Woods. Late reports establish the fact that the ice is out of Grand Lake, and most of the Schoodic chain. A number of Boston fishermen have started.

The ice in Newfound Lake, N. H., went out on Monday, and fishing began immediately. C. A. Gale, of Bristol, was the first to come in with a fish, a salmon of 7 lbs. W. F. Gale, of the same place, followed with a salmon of 8½ lbs. Ansel G. Doloff, of Bristol, took a 7 lb. salmon on Tuesday. C. E. Rounds, of the same place, has caught a trout of 2½ lbs. L. D. Foggy, of Plymouth, has taken three salmon weighing about 3 lbs. each. G. H. Greeley, of Plymouth, has taken several small salmon. Mr. Fox, of Hill, has landed a beautiful salmon. Nashua and Manchester anglers are also at the lake in good numbers, among whom may be mentioned A. E. Clark, J. P. Ransom, F. H. Thurston, T. J. McDonald, S. Sawtelle, O. H. Brown, J. C. Fletcher and F. G. Noyes.

Plymouth, N. H., reports mention good catches of brook trout. Frank E. Rollins, of that place, with his two sons, Frank and Ross, caught 135 trout from Duryin Brook the first day of the open season, Tuesday, May 2. J. G. Fletcher and F. Fletcher caught 125 the same day. The same day M. Robert Burns caught fifty very fine trout from Palmer Brook. G. E. Edmonds has taken thirty-five trout from the same stream. The brooks in the vicinity of Hill are also being fished with good success. G. W. Chaffin and F. H. Briggs fished these brooks one day last week with the result of sixty trout. Anson Buxton took fifty brook trout from the streams near Bristol early in the week.

The Ice Out.

BOSTON, May 8.—Moosehead and Mooselucmaguntic clear. Rangeley clearing rapidly. Fishing good. Richardson clear. SPECTATOR.

A Mountain Trouting.

FOR a week the weather had been cold and raw in the mountains, but June brought sunshine and the west wind in her train, and Hank and I concluded that the time was in flower for a serious offensive movement against the trout.

Acting upon our resolve, the crisp dawn of a mountain day saw us winding away down the road from the rough little cabin on the knoll that was our home camp. Hank's two wiry little horses, harnessed to a buckboard that momentarily threatened to collapse, made fair time over a roadbed that constantly made walking a preferable mode of progress, and the fourteen miles to Perkins' shanty at the junction of the Lewey Lake and Cedar Lakes trails, were traversed in time for luncheon. Leaving our horseflesh there, we took rods, slung pack basket over shoulder, and started off down the familiar trail to the Cedars. Having gone three miles we struck off to the left and traveled due east, striking the Jessups River within an hour, having crossed the headwaters of the Miami River on the way. The character of the water at that point not being to our liking, we followed deer paths for about two miles up stream to where the water roughened. Here we found the remains of a tiny surveyors' lean-to; we raised up the frame, readjusted the old slabs of bark, cut browse and arranged our exceedingly limited amount of duffle.

An hour or more of daylight was still ours, so we determined to try the water as a forecast of the morrow. Going a few hundred yards above camp, we put rods together and started in. We killed some twelve, fishing back to camp, and went ashore more than satisfied with the prospects. The fish were there.

That night we sat about the fire drying our clothes, talking in low tones of the coming sport, or quietly watching the smoke plumes swaying over the glowing craters of our pipes. Soon, knocking out the ashes against the guard-log, we crept beneath the shelter, and wrapping coats about shoulders, slept. The night was destined to have one interruption, however. I was aroused by a soft, crushing sound, followed by a slight shock, which was in turn followed by a series of muffled exclamations. A glance by the dying embers of the fire revealed what had happened. The fork of one of the uprights had given way, causing the roof to tilt and slide sideways and burying Hank beneath it. I lifted the roof for him to creep out, and then we repaired the shack, laughing heartily over the mishap.

In the grayness of dawn we left camp, and for an hour walked swiftly up stream until the water swirled and eddied about the bases of great boulders, or sprang melodiously down many little rapids. Here we rigged tackle, donned a liberal coat of tar oil, lit pipes and started in. The forecast of the previous day was upheld by the event, and never had fisher a fairer setting for his sport; stretches of rapids filled with small holes, wherein lurked many a fine fish; pools at bends studded with great rocks; occasional long, quiet reaches; the long, winding avenue of

the stream, with its borders of hemlock and balsam, beech and basswood, that ever permitted the free use of the fly.

Heavier and heavier grew our creels, and when we stopped for lunch on a broad rock their weight was very substantial. A short rest and smoke, and we resumed our sport. It continued as fast as in the morning, so at 2:30 we quit. The condition of my creel resembled that of the famous rattlesnake skin of Miles Standish when he returned it to the Indians, and the strap was cutting my shoulder sorely, while my partner had the same report to make. A full half of the fish we caught had been returned to the stream, and toward the end we became very exacting as to size. Our largest fish was precisely 1 ft. long, weighing 1 or 2 oz. under 1 lb.; but 9, 10 and 11 in. fish were common.

Dressing our catch, we broke camp and swung off down stream for Perkins', where we arrived in full time for supper. The next morning, lashing our basket of trout behind the backboard, we started homeward, arriving at noon.

On this trip I used a fly exclusively, while Hank pinned his faith to the worm. It may be of interest to the brotherhood to note that this occasion was one when the fly decisively defeated bait in point of size of fish killed.

Letters from the mountains tell me there are still 3 ft. of snow in the woods, and the lakes and streams are ice-bound, yet I know the dark water is gurgling and bubbling beneath eager to burst forth from its barriers in laughing cadences, and the knowledge rouses a fever of unrest in my blood. Shall it be lulled? Quien sabe?

"It is there that we are going, with our rods and reels and traces
To a silent, smoky Indian that we know—
To a couch of new-pulled hemlock, with the starlight on our faces
For the red gods call us out and we must go."

ZURUS.

Fishing Up and Down the Potomac.

Shenandoah City.

SHENANDOAH RIVER, the principal tributary of the Potomac, like the main stream, is stocked with bass from end to end, and has for thirty years been favorite ground for the angler.

At Harper's Ferry, the Baltimore & Ohio Railroad sends a branch line south along its west bank about three miles to Milldale, where it makes a horse-shoe curve, and leaving the river, climbs the grade through the valley of a little brook, Flowing Run, and goes on to Charlestown. This first two or three miles from its mouth has furnished much sport, as frequently when the Potomac comes down muddy, the bass crowd over into the clearer water of the Shenandoah, and besides, it is comparatively easy of access to strolling anglers.

Getting a team at the Ferry, we drive out past the charred ruins of an old flouring mill, burned during the war by the military authorities, on a charge of furnishing supplies to the enemy; past a modern pulp mill, with its pool and sluice full of pulp timber.

These paper mills, useful and necessary and profitable as they are, furnishing employment in localities near forests where for the most part there is little enough opportunity for steady work; which should command the respect and gratitude of every angler who reads, for they have wonderfully cheapened the dissemination of knowledge, and are doing much for the intellectual development of the world, yet seem to have no other effect than to rouse a mild fury in the bosom of the average angler, which gets him disliked in the neighborhood of mills, as interfering with a legitimate business without a better cause than a blind prejudice.

The constant tendency is thus to array against each other a good and necessary industry, with the local sentiment of the employees on one side, and a lot of strolling idlers, hunting for a time-killing amusement on the other, in which the latter have not much show either in argument or verdict; and if only the fishing was affected by the debris the angler might have long ago given up in despair. But this is the pulp mill's case. The true situation is that the mills are an object of curiosity and admiration to the angler. There is not the slightest prejudice among them against the business, though careless argument would sometimes seem to imply as much. But the angler is indignant at the individual who is responsible for disposing of the waste by dumping it into the river, and the individual cannot be reached, so the mill stands to take the blame for the useless and baneful pollution. If the refuse was filtered, so as to be harmless, as by law it must be in many places, there would be no antagonism. But when the acids are thrown into the river, and the shavings and pulp waste, to cover spawn beds, choke out riparian vegetation, filling the fish haunts under the stones with putrefying masses, altering the normal plankton to a degree we can only guess, is bad for the young fry, for our scientific experts tell us nothing about it; when they do all this, and then get angry at feeble protests, instead of curing the whole trouble by disposing of their wastes in some other way than unloading them into the river to contaminate it for miles below, the angler gets careless of disastrous results, forgets the community and its good, and the blessing of cheap paper, and finds himself enjoying a sense of relief at the information that the mill is to close down. It is all wrong. The shutting down of a paper mill is a national calamity, whether by a trust, or exhaustion of raw material, or any cause, and a hard blow for the locality that has come to depend on the employment and trade it has created; and it is no credit or service to the angler, because it establishes no principle or precedent, increases friction and helps nothing in securing what is demanded, what he is striving for, the clarifying of the refuse.

This mill has just given notice that it will close down when its present stock of material is worked up. But when it moves to some other locality, which will welcome it with open arms, it simply does the same thing over again and poisons some other stream.

The Potomac will some day be cleared of all pollution so far as practicable, not on account of restoring the finest bass stream in the world, but because the National Capitol stands on its banks and the city must use its waters.

The Hydrographic Office of the Geological Survey col-

lected samples of the Potomac waters from many localities above Great Falls, and these were examined by the microscopists of the Marine Hospital Service and found in almost every instance to contain the microbes of disease, and the physicians of the District of Columbia as a body denounced the condition of the water that is brought to the city for drinking purposes as unfit and dangerous. This is the lever on which the angler must depend for assistance in ridding the river of fish-killing wastes. But the poorest way of effecting this is by closing mills. Destroy the refuse.

To cleanse the river does not imply a threat to a single establishment. "Clarify the debris," that is all. Half a dozen States are now working hard to redeem the purity of their streams and incidentally restore their fisheries so wantonly destroyed, and their proposed legislation does not menace an institution. "Filter the wastes" and give the country an object lesson in cleanliness that is sore needed. Typhoid, one of the most dangerous and easily disseminated maladies that threaten health and life, is one of the easiest stamped out and prevented. It is one of the few whose germs are familiar; whose birth, propagation and spread are fairly well known, and whose destruction is simple. But it is river-carried, and quarantining a locality is no protection, unless the river is quarantined.

Washington has already suffered an epidemic, brought here by the Potomac from Cumberland, and her average death rate from this cause brings her well up to the head of the class of the great cities of the country, and there are other diseases carried and spread the same way.

There seems to be a misapprehension of the extent of an owner's rights who reaches a river bank, whether an individual or a municipality. That proximity confers ownership exclusive in the stream. This is only true to the extent of the use of such water as reaches him, and by no means gives him a right of sewerage in the channel. The right of pure water to which he is entitled is just as sacred to the man or settlement below, and the stream must be passed on in the same condition it reaches him. No city deserves the right to pure water from above, which sweeps its dirt into the stream to poison the waters below.

"Destroy the filth." The pulp mill which will do this will, by its example, confer a blessing on mankind.

Our regrets go with this one that is to be shut down. Only harm has been done, whether it is a move of a syndicate or the fear of prosecution. No lesson can be learned from its removal except perhaps in the direction of recognition, that resistance to material pollution in any considerable volume, has grown serious enough to hamper the offending industry.

A couple of miles beyond this pulp mill brings us to a long, low dam, diagonally crossing the river. This is Shenandoah City. There is nothing of it but the ruins of a couple of ancient flour mills and the name. Here if one brings his own boat or has previously arranged to have one ready, he may cover a great field of first-rate fly water. If he is to try his fortune afoot he crosses the dam to the east side and finds plenty of opportunity to test his skill.

The water of the Shenandoah has two distinct colors and a million shades between. In flood it is a brownish yellow, and as ugly as any puddle to the fly-fisherman. When at its clearest it is a deep oak green, and with appreciably more color than any of the neighboring streams, giving to the stranger an impression of lack of transparency; but, while this may lead him to carelessness in the matter of exposure and shadow, he quickly learns that it is no bar to the visions of the fish.

This vernal hue we have found to prevail as far as we have fished, up its 200 miles, and often liken the color of occasional pools in other neighborhoods, where trees or depth lends something of a like shade, to the "Shenandoah tinge."

Just below the long dam on this side is a foamy pool, where on one of our trips one of the party took his first bass with a fly, and the incident will never be forgotten. He was already middle-aged and had spent most of his life in the field, and was full of woods lore; he knew the haunts and habits, and was better than any of us, but he had not taken any kind of a fish on a fly since as a boy he had poached for trout, in a little Irish burn. When he fastened at his first easy cast under the apron to a pound and a half bass his excitement was intense. Hope and fear played tag with his emotions so fast, neither was it for long, but, like the lightning, was gone before one could say "it is."

But he saved his fish, and another devotee of the fly was initiated into the fraternity, and a welcome one. Many a time since he has joined us in our days up and down the Potomac: none more earnest, none more faithful, satisfied with light strings, jubilant over big ones, and out of his long experience in the open, with always something to add to our little stock of knowledge of the woods, the waters, or the life that makes these interesting.

Fishing from the shore for a distance above the dam on the east side is somewhat tantalizing, as there are few places where one may get good casts over favorable water, free of the brush which comes well down on the bank; but a half-mile up is a long, narrow wooded island, separated by a winding stream at medium stages of water, a torrent in flood.

Here the fishing in hot weather is delightful and profitable. Great rocks block the chute at intervals, rising high above the waters, which must find their way around in little falls and rapids, from pool to pool. Plenty of shade and grass beds, and everywhere the water is over a foot in depth, gives promise of a response.

When the sun is beating down on a still day, too hot for comfort, in the narrow valley of the rocky river bed outside, to lounge through this damp, cool covert, and creeping up the face of one of the great rounded piles drop a fly in a rift on the other side or in a grassy bowl, where a little rivulet trickles down, sure that somewhere thereabouts a big fellow is lurking, and to have such easy effort rewarded, is the luxury of fly-fishing.

For three consecutive seasons my friend, who used to spend his annual vacations here, had the coincident fortune to take seventeen good fish from the upper half of this chute in an evening's fishing, and still calls it Island No. 17.

On the outside of the island a series of long irregular ledges cross the river diagonally, over which the river tumbles in a broken cataract, called Bull Falls, and here at times the pools yield big catches.

The best season here is the late fall, when the water is low and clear, and one may cover almost the width of the river dryshod; but as one must take his holiday when he can, many a day is spent in vain effort to coax the fish from pools too deep or troubled, or the water side reached when a yellow flood is on and the fishing off.

But your enthusiastic angler does not count these days as wasted, but any day as found, spent any time under the sky.

In an article on British fishermen in St. Pauls (Vol. 2, p. 346), speaking of seasons, the writer says: "Some anglers hold that their year does not commence till May; that they cannot fish till they find the May-fly upon the water, while others, more determined for sport, are on the river side early in April, and keen salmon fishers will have a pull at the monarch of the brook in February. Again there are enthusiasts who will be at work before the end of January."

"These are like the gouty man in the well-known engraving. They would angle in a tub in their dining room rather than not fish."

But there be other ends to fishing than the two oft quoted, a fool and a worm. Where one can feel his flaccid muscles swell and harden under the hard work of pleasant days and summer suns; can lose that listless habit that grows upon the sedentary man, who has no hobby, pursued by the harpies of business cares that sap his life, these holidays are a foretaste of joys eternal. To one who feels these days of sunshine and flowers, of woodland and waterfalls, have not only added ten years to the term of his natural life, but have added to his capacity for enjoyment of the present, the pastime is looked on as something more than a diversion, and the fish that stands for all these is in gratitude, apotheosized.

HENRY TALBOTT.

Forcing the Season.

As usual, this spring I started fishing too early, and in impossible streams. "A vague unrest" is the cause, I suppose, for it is certain that a man takes longer chances for a fish after a winter of inactivity than when a number of excursions have slaked his thirst for the sport. I hope that destruction of fish and fishing do not mean the same to me, though there was never a man who hated worse to come in empty handed. I know a man who revels in the destruction of fish; he stabs the sluggish sucker and catfish in the back and waits around with a shotgun to catch some bird sitting still and pots it, and all for his insatiable appetite for things untamed. He does not go fishing in April; there is no chance of his getting enough to gorge himself. I believe he lacks imagination. Later on he will foul some fish and pick their bones. He is like the fish he pursues, the sucker, the kind of fish I take it, Lord Tennyson had in mind when he wrote:

"We are men of ruined blood,
Therefore comes it we are wise;
Fish are we that love the mud,
Rising to no fancy flies."

The writer is not so. We rise to the first balmy days and getting together our fishing things steal away to the fishing grounds, meeting some village mentor who casts the cold eye of disapproval on the signs of one of his neighbors lapsing again into his thriftless ways.

We have some early fishing here in the chubs. We know them as "horny-heads." They have a lot of red about the head, and bead-like excrescences cover the forehead. His general appearance indicates that he has been a faithful and consistent user of strong drink for many years. This fish heaps up great piles of pebbles of a bushel or more at a place. Its flesh is all but worthless, and it decays almost as soon as it is taken from the water. I often think of a verse from the old English poem, "The Red Fisherman," by Praed, when, having to do with this fish:

"The water was as dark and rank
As ever a company pumped;
And the fish that was netted and laid on the bank
Grew rotten while it jumped."

The most remarkable trait of this fish is its power to make a noise like a newly-hatched chicken, and quite as loud, when being taken from the hook. This is make-believe fishing sure enough. It bites like a trout, but it is nothing after you have caught it. A fisherman this year, who was forcing the season like myself, caught two very fine trout when fishing for chubs in a bass stream.

Last year I had one day's good luck early fishing. In the fall before, when I was walking up the Stilhouse Run, I saw a good-sized trout. I went back the following spring and caught a big trout where I had seen this one, and a larger one just below. In size they would have ranked well with the largest in a big catch. This year I have been more lucky with my early fishing, and I crave the indulgence of the reader in going over this evening the events of my April fishing. It is far better spinning yarns on paper than face to face, for, as you talk to a man who understands these things, you see a far-away look in his eye, which indicates that he is not thinking of the tale you are telling him but of the one he is going to tell you.

April 13 was the second day for months when the air became soft. For weeks a chill breeze had been blowing. There was not a sign of life in any of the trees. Even the scarlet maple, the first to burgeon in the spring, had not put forth buds. The day before a fisherman had gone to Stony Creek and had taken six fine trout. The poor fish had been kept on short rations for weeks, and were ready to take anything. Stony Creek is an ideal trout stream. The cool, clear water foams over miniature falls, and eddies in deep pools; large rack heaps present inviting spots for a cast. It lacks but one thing, and that is more trout. It has been fished to a standstill. It is too early for fly, and I try a worm. I fish up stream for half a mile and the fish refuse to respond. As I cast and let the line drift down through the eye of the pool it is arrested. Is it a trout or is it the bottom of the creek? How

precious one poor little pull on the line seems when fish are not biting! I let the line rest for a moment and strike, feel the fish and we part. It is a serious matter on such a day for a trout to trifle with you in that way. A few more pools are tried and a fisherman meets me. He has caught three in the first pool he tried, and had no bites since; thinks the wind is in the east. It is enough to put the wind in the east. Failure is written all over the records of the day, and as I came home tired, I think I am not as fond of fishing as I had thought. The history of this little fishing expedition may seem mostly preface, but all there is to tell was the anticipation, the only sure thing in fishing.

I had another day. My younger brother is bitten with the snake, and we went fishing a few days later in Stony Creek for revenge. We put the old gray in the buggy and took our dinner. We started in at the forks and succeeded in getting fifteen trout big enough to keep, which made a very decent show in a 10lb. creel. They bit freely for awhile, and I took about one in three. Then they ceased to take the bait, and we wound up at the Blue Hole.

I have a bite. One of those nibbling bites big trout in deep water so often indulge in, and which are so trying to the nerves in waiting for the fish to go to work in earnest. I "feel" the fish gently, knowing that it is a dangerous experiment, but inaction is intolerable. The nibbling continues until the bait is taken and the fish moves away in a strong, steady rush that causes the line to cut the water. I strike, knowing that I will feel the weight of a fish, and glorious consummation, a monster is hooked, and he makes one grand rush, and I think I have the master of the pool. But one strong rush settles it, and to the top of the water comes a large sucker. It is a very desirable addition to our catch, but it is not a trout. I thought when I first felt that weight there was to be a fight, but one effort is all the *cyprinidae* thinks it is necessary to make. Like a passenger being ejected from a train, they make only a show of resistance, and wait for further developments.

My best fish I took on Williams River, another no-account stream, but which yielded me enough trout. We got ahead with the work in the office, and my brothers went to another county for some athletic events, and the old gray horse, who enjoys a fishing trip as much as I do, was pressed into service for a polo game, and with spurs and a plankton holder, I hear he acquitted himself very creditably. He sweated, and helped to win the game for our side, and got his name in the papers. The spur was something he had never dreamed of in his philosophy before. I am expecting to get a fine offer for him soon, but I shall refuse. His being gone made it necessary to look for other means of transportation. Twelve miles into the mountains was most too much of a walk for me.

There is a superior colored person who attached himself to me sometime since, and who makes living easier. He owned a pony and dogcart, and the bare mention of his driving me to the meadows on Williams River was enough, and the problem was solved. There was an axle, he said, which Anvilson, who didn't understand steel, had welded, and which had let him down, but Hammerson, the rival blacksmith, had then welded it by a receipt which had been handed down from father to son. We risked it, and it proved worthy of our confidence. Balancing ourselves over the axle that means so much to a dogcart, we went up into the mountain. I know of nothing finer than to visit the high grass country to the west where an elevation of 3,500ft. makes you feel the "exhilaration of height." Uncle Harry told me tale after tale of old-time murders and other horrors; how the white people escaped when slaves could not testify, and how all the colored people were taken miles and miles to see bad white men executed, and how they all came home and got religion.

Twelve o'clock saw us at the head of the dead water. As I took a hasty lunch, an otter swam right before my eyes, and seeing me, dived, tip-tilting his fine tail into the air. Up stream is the best way for me to fish a trout stream, and I have never been able to determine whether it is really the right way to fish a stream, or being so little fishing up stream, it places the fisherman at a different point from that where the fish are accustomed to see a man.

I cast in the eye of a pool and the line stopped as the bait rolled down stream, but there was that indescribable sensation conveyed to the hand and arm that it was no dead weight that held it in place in the midst of the seething waters. I waited a moment and struck. Too late or too soon, or through some fault of the fish, I only felt it well, and lost it. This I did with seven fish. One was just being landed when it broke away, and all these fish were large. I examined my hook carefully and whetted the point with a small stone. The next trout that bit was taken, a fine one of 12in., but it dropped in some sand with the hook broken from the leader in its mouth. Putting on a No. 2 hook I had better luck. I believe the hook was dull. I often sharpen my hooks, and am not methodical enough to carry a whetstone, but find the nearest stone does equally as well.

A breeze sprung up soon afterward that made the fishing poor, but every now and then a trout was added to those in the creel. They ranged large. That is the rule here in early fishing. The large trout are taken all the year round, but small trout are not in the way in this month. The whole trip I did not take a dozen which I had any hesitation in keeping, and when I came home, grandsires, who had lamented the diminishing size of trout, said they had never seen a finer lot. Our law here requiring trout under 4in. to be returned to the water has a bad effect on fishermen. It encourages fishermen to keep all those over 4in. When they are reproached with bringing in little fish not larger than sardines, they will remind you that by inference the Legislature has declared them of lawful size and big enough to keep.

Before night I felt that there was weight in my fish basket, and that is a very comfortable feeling indeed. It reminds you that you have not lived in vain. I have made no arrangements for staying all night, having no time to get a camping outfit together, and having to travel light, I had felt no misgiving on the subject, and when I met the man of the neighborhood, I asked him

what the chance of stopping with him over night was, was disagreeably surprised to hear him say: "Pretty slim." He was under the impression I was with a crowd of people, and when he found that I was by myself, he very cordially invited me home with him, and he made me most comfortable.

He told me that some unknown dogs had been running deer into the river for their own edification, and he had sworn he would kill them on the first opportunity. That when it came he took his rifle to fulfill his vow, but his heart failed him, but that they should most certainly die next time. I encouraged him, for the thought of a doe heavy with fawn run to death by idle hounds was too horrible to entertain. I had seen these very dogs on the river, and not thinking what they were about, had given them the remnants of my lunch. He told me that he had got one bear last fall, and that a .25 caliber is big enough for anything in these mountains. He had heard of a bear in a certain locality. Had said to himself that the bear was probably using under a certain clump of chestnuts; had packed a 43lb. bear trap four miles, and set it under leaves and cut sweep apples up and scattered around it. Had found the bear in the trap on the second morning unable to move the trap and drag, and had shot it. Had got some good bee trees last summer. Surely life far from the haunts of men has some compensations. If my host ever quarrels with his wife, he falls out with all the people in his neighborhood. In this log cabin of very modest dimensions is the little daughter of the house, a timid two-year-old maiden, whom Uncle Harry nearly frightened into fits, as she had not seen a black man. If any one desires to know what a child can be to its parents they should see this mountain home on the banks of a brawling stream.

Next morning, April 21, was the first clear morning of the year without frost, and so I brushed the dew away as I worked my way up stream. The narrow valley had been cleared, and the ground was carpeted with a thick blue-grass sod. The fall of the stream was so great that in walking up the narrow meadow one seems to be ascending a hill.

It was a perfect morning, and I was under its influence, and thought then that some day I might tell of the day, the high mountains, the falling waters, the sun and shadow, but the hour is past, and, leaving such descriptions to those who can find words to record their sensations, I fall back to the plodding recital of occurrences.

This was one of the rare early days when the trout would take the bait on top of the water. I fished over the ground I had passed over twice the day before, and at a likely place, where I had not been able to do any business before, a large cream-colored trout darted to take the bait, and giving it too much time out of too abundant caution, I lost the best trout I had yet seen. If I had not seen it I would probably have caught it.

Every now and then I would strike a fish and land it as soon as possible, as is the rule in fishing for brook trout. At the best pool I know of on the little river I had a most vigorous pull. I dropped the point of the rod an instant and struck. I felt the weight of a fine fish, and in the first contest the line parted at the tip of the rod without giving me a good idea of the fish's size. I think if I had ever gotten the fish turned I could have landed it. I had a similar experience. I saw a little pot of water large enough to afford a lurking place for a trout, and so situated that only those who are on the lookout for such places, which, from their location, have been unobserved and untouched by the common herd, would choose for a cast. I have better luck in such places for trout than any other. The conditions are such that in streams fished to death, it is often useless to try the show places, and trout can only be caught when they lurk in some spot which has not caught the fisherman's eye, and who, therefore, have no cause to suspect that their daily bread is loaded. A wood might be practically denuded of its flowers, and yet a violet or two might be found in its hidden places. I hope I make myself clear.

It was in such a place that, by ignoring a long shallow pool, I walked half-way over in the stream and cast where a small part of the water passed behind a boulder. I let the lure wash down in the current, and in front of the boulder a big trout showed up and snapped the bait. I struck, and the current and weight of the fish broke this line above the leader, though I had changed reel and line after my late mishap. Truly, "nobody knows what trouble we see." Having caught a lot of big trout with the lines, I have reason to believe that the largest fish got away. As the old song runs: "We've all been there before, many a time!"

The writer asks to be excused if he has taken too long in saying, "April 21, fished in Edgar Beard's hacking; caught twenty trout. April 22, fished same place till noon; caught thirty-one. Had fish for breakfast and took a 10lb. basketful home. Uncle Harry not at trysting place; carried kit and fish basket (approximate weight 60lbs.) up mountain two miles and a half to cart, and found Uncle Harry lying in the sun, sufficiently apologetic for having missed me."

MARLINTON, W. Va.

ANDREW PRICE.

Cable Car, Pike and Muscalonge.

LAST week, as the forms of type of the FOREST AND STREAM were on their way to the press room, an electric car conductor, turning his motor the wrong way, put on full speed and threw forms, wagon and driver into the air. The driver was pitched out over the horse's head, the wagon was landed on its side in the gutter, and more than half of the pages of type were knocked into pi—which is a printer's expression for one of the most hopeless kinds of chaos on earth. By putting in a solid night the very efficient foreman of the FOREST AND STREAM printing office had the paper ready for press not more than fourteen hours late.

By a mistake in the make-up of the angling pages, the cut of a pike was substituted for that of the muscalonge in Dr. T. H. Bean's capital paper on this fish. We regret the confusion which must have ensued in the minds of our angling readers, who have doubtless been puzzling their brains to reconcile the illustration with the fish they have always known as the muscalonge.

CHICAGO AND THE WEST.

Col. Fox's Fly Dope.

I had occasion last summer to mention in the columns of FOREST AND STREAM the excellent fly dope which we used on the Boardman, in Michigan, and which was prepared by Col. E. Crofton Fox after a formula of his own invention. This ointment was not a theoretically good thing, but an actually good thing, and its deviser was a man whose experience in the pine woods of America and the tropical growth of lower latitudes had made him anxious to secure a preparation which would afford real protection against biting insects. I can vouch now, as I did then, for the efficiency of the dope, as can my friends to whom Col. Fox has given the formula. As Col. Fox is not in the dope business, and only made known the formula as a courtesy to his friend, I never felt like telling the formula to anyone, and never did so, but I have been obliged to answer a great many letters and have sometimes referred such letters to Col. Fox, who was good enough to hand them over to a firm of druggists at his home in Grand Rapids who knew the formula. This week I sent him one more letter, this time from Mr. L. Fisher, of Allentown, Pa., who wrote me and sent me \$1 to get him up a bottle of this compound. Now, I am not in the drug business, nor is Col. Fox, we both having other things to take care of, he being busy buying tracts of lumber, and I myself much occupied with elevating trap shooting and doing other great and good deeds in this naughty world. Well, anyhow, Col. Fox wrote me a letter, and he sent me the formula, and here are they both. I am very sure a great many sportsmen will thank Col. Fox for his courtesy, as I am sure I do again. A nicer man never put foot in a wader.

Cut this recipe out and paste it in your fly-book, and remember Col. Fox. If any outfit ever tries to sell you a box of dope made up on this recipe for trade purposes, don't buy it. Make your own. This is amateur and not professional dope, and it is good. Col. Fox writes:

"Your inclosure from Mr. L. Fisher, of Allentown, Pa., has just come to hand. I think that you and I have both been bothered enough in regard to this matter of Fox's fly dope, and I have concluded to publish the recipe in the FOREST AND STREAM for the benefit of fishermen and hunters of this country. You will remember you used it with me on the Boardman River last June, and I gave you the recipe at that time, with the request that it be not published; but since then I have become so solicitous for the sportsmen on account of my own suffering that I am desirous of benefiting them by giving to the public this prescription, which I have made during the last twenty-five years' experience in fishing, hunting and estimating of pine timber in all the States of the Union and in Canada, and in Mexico and Central America. I can vouch for its efficiency against all the vermin found from the Equator to almost the North Pole. I trust that I will have the pleasure of meeting you in the near future on a trout fishing expedition in this neighborhood. I return the postal money order sent you by Mr. Fisher, which you can return to him with my compliments. If you wish to publish the inclosed recipe he will be able to have it put up in his own city."

The following is the recipe:

B' Fox's Fly Dope.

Oil Pennyroyal.
Oil Peppermint.
Oil Bergamot.
Oil Cedar.
F. E. Quassia.....aa 3i
Gum Camphor.....iv
Vaseline Yellow.....5 ii

M. S.—Dissolve camphor in vaseline by heat, when cold add remainder.

How to Fasten Your Creel.

You buy a nice new creel, don't you? And you find a nice wicker-work loop sticking up to hold the lid down. You poke a stick through this, and then you knock the stick out, and the lid comes open just as you are wading a deep and swift bit of water, and your trout all get out of the basket. Then you get another stick and poke it in the loop hard, and this time the pesky thing breaks off and leaves you with a loose lid.

Of course, the hole in the top of the lid is supposed to be there for the purpose of poking the trout through it into the basket, but this only shows how very little of human nature was known by the man who designed the trout creel of commerce. It is all right to say that one should tie down his lid firmly, poke his trout through that hole, and not look into the basket till night, but this is founded on anything but rational premises. Any fellow knows better than that. Here you, are just out of the house after a winter of dolor. You get into the stream—feels nice on your feet, doesn't it, and better yet about your knees, and still better when it runs high as your hips?—and you get to work, and you catch a trout. You put him through the hole in the lid, and go on casting. But do you leave that lid locked down with a string? Nay, prithee, say not so! You do far otherwise from that. You go along, to the next bend at farthest, and then you are seized with a desire to know how that trout is getting along in the basket. You want to see him, to hold him again in your hands, to have converse with him, and to express once more your admiration. Can this all be transacted through the hole in the lid of the basket? I trow nay. There is nothing more needed in the world than a good, easily opened fastening to the lid of a trout creel—not one that will shut easily, but come open easily. Shall mankind sit at lunch on the bank, with trout in the basket near by, and not open the same basket, and lay forth its contents upon the cleanest sward there is to be found? Say not this in anglerdom. We have long enough tolerated this policy of the closed door.

Now, if you will take a stout rubber band and fasten it by passing it between the strands of the basket some 6in. or so below the locking loop, on the front face of the basket, you will begin to have light and happiness dawn upon you. You will grasp the idea without much further direction. Pass this rubber band up until it sticks out through the little hole in the front edge of the cover, which is cut for the purpose of letting through the locking loop.—Cut off this worthless loop, for it will only

break off pretty soon anyhow. Get a little stick zin, long and make a half hitch or loop of your rubber band about it. This is now your lock, the stick lying on top of the lid at its edge, and the spring of the rubber holding the lid tight shut. When you want to put in another trout, or still more likely, want to have a look at the trout you have already caught, just pull up the lid without unfastening anything at all. When you let go the lid it will snap shut again and keep shut, and will not let your trout spill out, no matter how your basket hangs. If you want to open the basket wide to get out your fish, push the stick through the hole endwise, and it hangs free. The man who will put this simple device on his trout creel, instead of the old, conventional wicker loop, which was invented in the days of Noah and is no account today, will sell creels where the old sort will not go.

"Bait Charm."

Did anyone ever hear of a "bait charm"? Did anyone ever hear that some fishes bite after finding their bait by means of smell? Did anyone ever put anything on his bait for the purpose of "drawin' the fish"—I don't mean the good old system of spitting on the bait; everybody knows that that is a good thing, and especially good when the fish are not biting very well.

I do not know just how the matter happened to come to my mind, but I recently bethought me of a certain odd character I met years ago on the banks of the old Skunk River, in Iowa, when I was a boy. This was an old, dried up, wizened, short, thin little man, who was fishing for a living along that stream, which was then a good angling water. This man could always catch more fish than the best of us, especially of such fish as suckers, red horse and other fishes that bite at worms. He always put some sort of scent in his worm can, but would never tell what it was. He said he would guarantee to make a finished angler and perfect gentleman out of anybody who would give him a \$5 bill, but he was not loosening any information for anything but cash. Tradition runs that a certain young man of that vicinage who had more wealth than sense produced the \$5 and learned that bait scent was sometimes anise seed oil, sometimes peppermint, and I think also another ingredient, which I do not now recall. Only a little of this was used, a few drops

My friend Ed. Rock, above referred to, is a blacksmith. I believe I should have liked to be a blacksmith myself, for it must be nice to pound things out of iron, but I have never yet got to the place where I could do all the things I wanted to. In every village there is one man who knows more about shooting and fishing than anybody else. Sometimes it is the barber, sometimes the minister, and sometimes the blacksmith. In the case of St. Charles it is the blacksmith. Ed. Rock may get his hands soiled a little now and then, for you can't be a manicure and a blacksmith too, but withal he is a good deal of a sportsman. He understands the habits of the bass, and knows about the ducks and snipe. He doesn't believe in shooting duck on the water, or jerking fish out by main force. Much of a naturalist as well as fisherman, you can always learn something of him during an hour on the stream. Not without philosophy, moreover, is he, as should be the case with your genuine angler. "I see folks a-sittin' and a-sittin' on the bank," said he, "and sometimes I wonder what makes a fellow like to fish, anyway. It can't be just the fun of catching a fish, fer when you catch a fish you take him off and put him on the string and don't make no great fuss about it, and pretty soon you forget it; but then you go right back to fishin' again, and keep on just as if you hadn't caught any fish at all. If you get another, it is the same thing over again. Folks keep on sittin' here, and they catch a few bullheads and suckers, and they put them on the string, and go on fishin' again. What are they looking fer, and what is it they expect to get? Sometimes it seems to me that a feller is tryin' to catch something that ain't in the river."

Methinks there may be some truth in these sayings of my friend Ed. Rock. We go on fishing and fishing, and waiting and waiting, and sometimes, if we stop to think, the conviction might indeed come over us that we are expecting something that "ain't in the river."

The Ananias Fishing Club.

The same friend writes me: "The Ananias Fishing Club, of Louisville, Ky., will leave for Lake Erie on their annual fishing trip about the middle of May next. This club is composed of some of the leading business and professional men of the city. There will be sixteen of the

Connecticut's Misfortune.

Editor Forest and Stream:

If there ever was a time when Connecticut sportsmen were indignant, that time is now, and the reason is the Governor's action in his appointments of fish and game commissioners. After many years of fruitless work it was acknowledged in 1895 that the time had come to change something and see if it was possible to obtain better results. After many weeks of talk and much hard work a bill was favorably reported to abolish the old fish commission and create a fish and game commission. It so happened at that time that Gov. O. Vincent Coffin, of Middletown, was very much interested to further these interests, and he appointed three commissioners—James A. Bill, of Lyme; Hubert Williams, of Salisbury, and Abbott C. Collins, of Hartford. Their work was so successful that in 1897 Gov. Lovein A. Cooke reappointed the same gentlemen. For the last two years the work of this commission has been far in advance of our expectations. Owing to press of business Mr. Williams, much to our regret, was obliged to resign, but his successor, Dr. Knight, of Lakeville, was a most estimable gentleman, and ably assisted Mr. Collins in the work. Owing to age and its attending infirmities Mr. Bill, of Lyme, became incapable of active work, but his long experience and service lent dignity to the commission, and we all regret his necessary confinement.

But as long as Mr. Collins was on that board every one knew it would be a success. He it was who set the example of enforcement of the fish and game laws. He was the one who discarded the system of planting fry and substituted fingerling fish, with results that astonished all. No man in any public position ever held the confidence of such portion of the public as are interested in these matters as he does. No man ever paved the way for so much to be done at so little expense as he has, and as a reward for himself and for the satisfaction of the sportsmen he is now dropped.

Who are his successors? Mr. Bill, of Lyme, infirm with old age and unable to do anything, is retained. The immediate successor of Mr. Collins is a Mr. Solomons, of Norwalk, called an ardent sportsman, but by occupation an oyster grower; one who never raised a voice in

THE MUSCALONGE.

From Fishing Industries.

in the can of worms, for its strength would scald the worms in short order if too much were used. I know we boys who in time learned this "secret" always religiously employed scent for our worms when we went fishing. I have sat by the side of this quaint old character by the hour, watching his sucker lines (throw lines, with a little twig at the edge which held a loop of line and showed the gentle working of the sucker at the bait) and listening to him discourse ex cathedra on the art of fishing. I remember that a part of his set lecture ran to the effect that "some fish bit by sight, some by scent." He classified all the worm-biting fish in the latter category, and I think he also placed the pickerel there, though this is but a vague memory, for which I can see no foundation in likelihood. There be more things in heaven and earth than the bookmen ever get hold of. All I can say is that the old duffer always had a bigger string of fish than anyone else who fished along the river. I long ago ceased to use his "bait charm," but it seems I have not forgotten the man, and I would go a good way to see and talk with him again, for he was fuller of stories than I at that time suspected, since I was then perhaps only eight or ten years of age.

Bass.

Up at Fox Lake, in this State, the bass are running, and market fishermen have been catching forty or fifty a day with hook and line. The fish are just coming out of the deep water, but are not yet on the spawning beds. The spawning season will be very late this year. This I gather from the talk with Mr. Charles Hills, a gentleman who fishes in that district considerably, and with whom I have passed some pleasant hours in a casting contest in which speed, style, distance and accuracy were never for a moment in doubt.

I still have no word from my friend Ed. Rock, at St. Charles, on the Fox River, and I infer that the bass are not yet running there, which is a most singular state of affairs, they being now three weeks past due. I should like to have a day with the fly in that country some time this summer. You can take a trolley car at St. Charles and spin rapidly north several miles until you strike the riffs below South Elgin, where later on there is good wading and fly-casting. This is within forty miles of Chicago. In July there should be good sport there. Yet another place which the fly-fisherman ought to keep in mind for the coming summer is the Mississippi River just above LaCrosse, Wis. This locality I have often mentioned, but have never personally tried. Friends tell me that it offers magnificent sport.

members in the party. They will make their headquarters on Middle Bass Island, and will have a large tug boat with the necessary smaller boats to take them to the various fishing grounds. The president of the club and admiral of the fleet, who takes charge of the party, is a veteran angler, who has had a wide experience from the trout of the Nipigon to the tarpon of southern Florida."

Animate Oddities.

Just now they are having a big run of "spoonbills" up the Ohio River. There are two sorts of spoonbills. One is a duck and one is a catfish. The latter is sometimes called the "shovel-nose cat." He is a very weird sort of creature that runs mostly to nose. He uses his nose as a shovel, and hence gets his name. The shovel-nose is a very obliging sort of beast, and devotes most of his energies to getting into nets, from which he ultimately appears in the Southern fish markets, minus his head and tail, and bearing some name or other to conceal his identity.

I was once fishing in the Iowa River, about 100 miles above its mouth, and I caught a sort of thing which made me drop my rod and take to the woods. It was about 2 ft. long, and tapered from front to back till it was only about as thick as one's thumb at the tail. Its tail had two blades to it, one longer than the other. Its head was unearthly, and its mouth was underneath its chin. All along its back it had a row of horny scales. It came out of the water in a tired, listless way, and made no reply when I asked it what it was. I was only a freshman then, and did not know that this was a shovel-nose sturgeon, which I take it is some sort of a survival which was tired of life before Adam was on earth. The fish offering no objection, I took it home, and three of us worked for a week trying to mount it so that it would look like something. We threw it away eventually, though it lingered long with us as a sort of nightmare dream.

480 CAXTON BUILDING, Chicago, Ill.

A Monster Shad.

POUGHKEEPSIE, N. Y., May 1.—I inclose a slip which was published in our Sunday Courier, and which the editor tells me this morning was first published last week in a paper at Marlborough: "Grant Baxter, at Hampton, on Friday caught a shad which weighed 23 lbs. and was 3 ft. in length. The monster was exhibited in Frank E. Merritt's store at Marlborough." This is certainly a "whopper." I mean the fish, of course.

J. S. VAN CLEEF.

defense of a game or fish law, or ever had any actual experience in propagating fish. The third is by occupation a brewer. Now, I am not going to comment on this make-up; it is unnecessary. What Connecticut needs now is a fish culturist. What we do not need is this commission. Let the General Assembly create the former and abolish the latter; have him elected on his merits by the Assembly, and thereby save the State two-thirds the cost of a useless commission; and let a good, competent man carry on the work so ably begun. It is all well enough to talk about ardent sportsmen filling these places, but it takes experience and pluck to obtain results. Results are what we want, not ardor. Let us see if our representatives can arise to the necessity.

CHAS W. HALL.

HARTFORD, May 8.

Guides and Guiding.

Editor Forest and Stream:

I have made many trips to Maine, always for fish, as I do not care to shoot large game. I do not recall a guide in my employ but had some "axe to grind." When I have lodged in camps the guide favored some friend who owned a specially "well kept camp." Often no fish were to be taken within miles, but the tenderfoot finds this out only by persistent whipping of the waters and the usual bluff, "Well, they are not rising to-day." My early visits to Maine were mostly devoted to paying board for myself and guide at "well kept camps," where none of the guests averaged as many or as large trout as one may get within twenty-five miles of New York City.

I found by experience that if I wanted fishing I must locate it myself. This led me to studying the country, getting information from loggers, sportsmen and others, and with guide, canoe and tent striking into the woods and persistently following my own route, often against the wishes or directions of the guide. When the guide is not working for a "well kept camp" he is usually hunting for an easy route for himself. In this way I have had the finest of fishing and the excitement of following often an unknown route, and in this way getting the full flavor of a woods' trip.

There are many lakes and streams in Maine where at any time during open season excellent fishing can be had; the difficulty lies in knowing where to go. I make a practice of learning all I can about a section which I visit, so that I may return to it and fish more or less familiar waters. My experience with guides generally is that they know little and care less about fishing. They are often

ready to spoil a cast in order to chase a deer, and, shall I say it, get a shot even out of season.

That there are exceptions among the guides—men who will honestly work for the interest of the sportsmen—I willingly admit. To any one knowing such I say "bonne chance!" Stick to him. He is a treasure, and can do more to make a woods' trip what it should be than one can imagine who has not tried both kinds of guide.

Dog Sense.

Editor Forest and Stream:

The following anecdote may be deemed worthy a place in "Instinct vs. Reason," of late so prominent in the Kennel Department of FOREST AND STREAM.

My friend Dr. Messer, of Waupun, Wis., has a white bull terrier which displays reason, in my mind, though others may call it instinct. Billy is a great ratter and mouser, and has learned to adopt the cat's method and wait for his prey to come out of its hole. Then he waits for his victim to get some distance away from the hole before undertaking to make a capture. He learned this method by sad experience, for at first he would jump at the rat or mouse as soon as it appeared, and usually with the result that the intended victim escaped back into its hole. Billy showed his ability to reason a day or so ago. A cookie had been laid down in front of the cupboard to coax the mice out from underneath. One came to the cookie and Billy saw that it was too close to the cupboard, so he picked it up in his mouth and carried it about 4 ft further away. Then he went back to watch for the mouse to come out, certain that he would get his prey before it could get back and out of his reach. Was it reason or instinct that caused him to move the cookie out further?

D. J. HOTCHKISS.

FOX LAKE, Wis., April 26.

Editor Forest and Stream:

I have been much interested in the discussion of animal instinct and reason, and wish to relate an incident bearing on the subject.

A few years ago I had an English setter that was the most intelligent dog that ever lived, of course. We have all had them. While hunting with her one day in September I crossed from one field to another, and on climbing the fence called her in for a rest, as the day was hot and no water was accessible. After lying in the shade of my body for a time she got up and began to range. The ground ascended for about twenty rods from where I sat and then declined into a slough.

She quartered the ground on my side of the hill, passing back and forth at the top two or three times before disappearing. She was gone perhaps twenty minutes and I was thinking of going to see about it, when she suddenly came up over the hill, and, turning broadside to me, made a perfect point. I was surprised, as I had seen her cover the same ground before going out of sight, but climbed down and walked up toward her. When within about two rods of her she broke her point and ran down on the other side of the hill into the slough and made another point. I followed her and flushed a fine covey of birds within 20 ft. of her.

If this was not reason, then I am willing to admit that animals do not possess it. If it was instinct, from what source did she get it?

We had the best quail shooting last fall we have had in twenty years, and the birds survived the cold weather excellently.

When the season opens I can raise a dozen coveys in six hours any day if the weather is favorable for breeding.

H. E. JAMES.

IOWA.

Editor Forest and Stream:

I have been thinking of one point in regard to the subject of dog's reason that I do not remember to have seen brought out. It is an incontrovertible fact that dogs dream. How many times after a hard day's hunt, the dog is very tired, and we let him lie under the table or by the fire. Soon he begins to stir in his sleep, whines and lets out a bark or two. We administer a gentle kick; he awakes, and soon the same thing is gone over again, and it is evident he is living over again the events of the day in his dreams.

Now, dreaming is a sort of a continuation of thought, for how can an individual or animal dream who cannot think? And just where thinking ends and reason begins is hard to answer.

Some years ago, when living on the farm, we owned a beautiful Irish setter, one that seemed to comprehend almost everything said to him; and in the fall, when the hunting season was drawing near, that dog would never leave my father nor myself for a moment. He knew it was almost time to go shooting. Now, the question is, how did he know it? Instinct hardly, for that would mean in a dog to hunt all the time. If high-bred, intelligent dogs do not reason, then perforce they must possess some sense we have no word for.

L. E. M.

NEW JERSEY.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Mad Dog Bite Cure.

In the year 1846 our family lived at No. 66 Washington street, Poughkeepsie, N. Y. The house we occupied was owned by an aged widow and her daughter, Mrs. Drake, also a widow. The mother's name was Vanderbilt. She was a relative of the old Commodore, and a blessed soul was she—a fine type of the good old Dutch Reformed. I well remember the account she gave of the burning of the ship Pulaski at sea; of how her relative (nephew, I think), Charles Tappan, was rescued, and how his hair was blanched almost at once by the horrors of his situation. When we moved from Poughkeepsie I came across a book in the school library, entitled, "Disasters at Sea." Supplementing the description of each catastrophe was a list of the lost and saved. Sure enough, I found the name of Charles Tappan connected with the account of the burning of the Pulaski.

But of the mad dog cure—in which, I think, she had no faith, but gave it to us as a thing of curiosity and superstition. She spoke of it as a matter of long ago, which must have dated back into the eighteenth century. It consisted of crusts of bread, upon which was written, with ink, five words, each word containing five letters. The bread was to be given to the person bitten for a certain number of days consecutively, then omitting several days—resuming and omitting thus for a given time, how long, however, I have failed to remember.

I give the words used, with my humble opinion, that never has there been a more ingenious arrangement of letters than this:

SATOR
AREPO
TEMET
OPERA
ROTAS

You will see that the top and bottom words and those at the left and right (all around) spelled forward and backward, are all the same words. The second lines, up and down, crosswise and backward, spell the same words. The middle up and down, forward and backward, is one word.

If this bread pill was as effectual as it is curious, there would be no need of Pasteur institutes.

N. D. ELTING.

Canoeing.

THE programme of the Buffalo C. C., published this week, calls attention to the absence of similar announcements from the many older, larger and once prominent canoe clubs of the country. In England the canoe racing season opened with the 1st of March, and regular weekly races, sailing and paddling, have since been held on the Thames. Though May is well advanced, there have not only been no canoe races in this country thus far, but practically none have been announced, the exceptions being the A. C. A. meet in August, the Buffalo C. C., the Springfield C. C. and a few others. With the popularity and prosperity now attending most branches of outdoor sport, with many established canoe clubs, well housed in suitable localities, it is strange that there is practically no canoe racing in this country. It was quite a matter of course that canoe racing should suffer a decline with the withdrawal a few years ago of such men as Vaux, Whitlock, Gibson, Oliver, Brokaw, Ford, Jones and many others, who after years of devotion to canoe sailing were compelled to abandon it through the claims of business. At the same time, there is no apparent reason why their places should not have been taken by new men; the interest in all kinds of sailing and water sports is far more general now than it was twenty years ago, when canoeing came to the fore so rapidly with a host of enthusiastic followers.

Of course, the machine nature of the modern racing canoe has exerted a strong influence to keep men out of racing; but in spite of this there is nowhere apparent the interest in canoeing and canoe sailing which might be expected in this country, with its magnificent possibilities for the enjoyment of the sport.

The Buffalo C. C.

THE Buffalo C. C. has within the past three years come to the front as one of the live American canoe clubs, and this year it is making a special effort to keep up its position. The following lengthy programme of races for the season has been arranged.

Details for Sailing Races.

If any trophy or pennant races are postponed on account of weather notification of the postponement will be sent to those having forwarded entries.

Pennant races for the B. C. C. class and open sailing canoes to be judged by points, the first four to be counted: 20 for the first, 15 for the second, 10 for the third, and 5 for the fourth. Boats or canoes to be sailed by the owners.

All sailing races to be started promptly one hour after the arrival of the steamer at the dock at Crystal Beach, reckoning on the first steamer leaving Buffalo after 1:15 P. M.

The Bay Beach trophy to be raced for by B. C. C. and B. Y. C. according to the deed of gift.

The Bird races on Aug. 12 and Sept. 4, open to birds owned in the B. C. C. and B. Y. C.

A special prize has been offered by Vice-Commodore Forbush to the owner of sailing canoes doing the best work at rigging on May 27, A. M.

Half-raters, so called, are for boats in the class of the Dad.

X—Free for all, races to count points for a special season trophy, and races postponed on account of weather to be declared off.

T—To count points for the season for a special club prize in the open canoe sailing.

H—If postponed on account of the weather, races to be declared off.

K—To count races for the season for a special club prize, and if a tie occurs additional races to be sailed.

Paddling.

All paddle races to be declared off if not run on schedule dates. Entries for the tandem paddle to be made in writing one day before the race to the secretary of the regatta committee.

X—To be counted in points for the season for a special club prize.

M—To be counted in points for the season for a special club prize.

S—To be counted in points for the season for a special club prize.

E—Activity badge. Three of these have been donated by the commodore for members entering and starting in the greatest number of regatta committee events during the season. Gold for the first; silver for the second, and bronze for the third. This applies to both sailing and paddling events.

F—This E to apply to races at the A. C. A. camp.

May 27, rigging. EX, scrub races.

May 30, A. M., EXII, free for all. P. M., EX, full line.

June 3, E, pennant race, class boats only. ES, tandem paddle. EM, combination tandem.

June 4, E, cruise to Pt. Abino, church, return via Crystal Beach.

June 10, E, carrier trophy. Open class, E X, war. EHT, open sailing canoes, A. C. A. limit. EX, stand, single.

June 11, E, cruise to church and sail with lunch in boats. EX, boat race.

June 17, EHK, half-raters. EX, tandem, ¼ miles, four turns.

June 17 and 18, E, Buffalo C. C. at Irondequoit Bay, Rochester.

June 24, Ladies' day; EHX, bird class. EM, combination tandem; EX, full line.

June 25, E, cruise to church and lunch at Sand Hopper. ES, tandem trophy.

July 1, E, pennant race, class boats only. EX, tail-end.

July 2, E, cruise to Windmill Point.

July 4, A. M., EHK, half-raters; EHX, free for all. P. M., EX, full line.

July 8, E, Buffalo C. C. at Buffalo Y. C. EX, sailing races. EX, paddling races.

July 15, EHX, bird class. EM, combination quod. EX, tandem paddle with hands. E, Buffalo C. C. at Toronto C. C.

July 22, E, Bay Beach trophy. EHT, open sailing canoes. EX, tilting. EX, quod, A. C. A. limit.

July 22, E, illuminated parade and ladies' day. E, church; lunch at Port Abino.

July 23, E, Crystal Beach trophy. EXS, tandem trophy.

July 29, Open class. EX, war.

July 30, E, church with cruise and lunch in boats.

Aug. 5, EF, A. C. A. camp, Aug. 5 to 18. E, pennant race, class boats only. EM, combination tandem.

Aug. 6, E, cruise; lunch at Calloll's dock. EX, tail-end.

Aug. 12, EHT, open sailing canoes. XH, A. C. A. limit. EX, canoe, one-man paddle with hands. EX, boat race.

Aug. 13, Church.

Aug. 19, Buffalo Y. C. at Buffalo C. C. E, Bay Beach trophy, open class. EX, full line.

Aug. 20, Cruise with B. Y. C.

Aug. 26, E, carrier trophy, open class. EX, tilting. EM, combination quod.

Aug. 27, E, Cruise to church, and lunch at Sand Hopper.

Sept. 2, Ladies' day; E, pennant race, class boats only. EXS, tandem trophy. EX, scrub races. Toronto, Rochester, Irondequoit canoe clubs at Buffalo C. C.

Sept. 3, Toronto, Rochester, Irondequoit canoe clubs at Buffalo C. C.

Sept. 4, Toronto, Rochester, Irondequoit canoe clubs at Buffalo C. C. A. M., XH, bird race, special prize. EXH, free for all. EXMS, full line. EX, stand, single.

Sept. 9, E, Crystal Beach trophy, open class. EM, combination tandem.

Sept. 10, church.

Sept. 16, EXH, free for all. EX, war. ES, tandem trophy.

Sept. 17, E, cruise on land, led by Dad. EX, quod.

June 23, EH, handicap race (regatta committee prize). EX, canoes vs. boats.

Sept. 30, EH, free for all birds. EX, stand, single. EX, backward single.

The Canoeist's Art.

Editor Forest and Stream:

During the sixteen years which I have been a canoeist I have always cherished the idea that it was the one branch of sport into which professionalism would never creep. This fond delusion has been dispelled by the following advertisement cut from to-days' Herald:

CANOEIST, professional, teaches the art of canoe sailing; success guaranteed; reasonable terms. EXPERIENCED CANOEIST, Herald Downtown.

It would seem, however, that the novice who finds it necessary to make his debut in this, the most charming of pastimes, under the wing of a paid coach, would hardly be of a class which would find much enjoyment in the sport or a very warm welcome from the ranks of canoeists generally.

As a matter of fact, anyone who pays for lessons in canoeing simply wastes his money, for if there is one thing which delights a veteran canoeist more than another, it is to teach a beginner the simple mysteries of managing the tiny craft—mysteries, so simple indeed, that if more knew how easily they were acquired, the canoe camps pitched weekly along the Jersey shore of the Hudson, from Englewood Beach to Alpin, would be reinforced by many who now spend Saturday and Sunday, bent over the handle bar of a wheel, swallowing the dust of the highway.

E. T. KEYSER.

NEW YORK, April 30.

A. C. A. Eastern Division.

BOSTON, May 5.—*Editor Forest and Stream:* The spring meet of the Eastern Division of the American Canoe Association will be held on Horn Pond, Woburn, Mass., from Saturday, May 27, to Wednesday, May 31.

This spot is very conveniently located on the outskirts of the town about eight to ten minutes' walk from trains of the Boston & Maine Railroad. The site selected for the camp is on a high elevation, where one can overlook the pond; also all the races. The course is a good mile straightaway, finishing right in front of the camp. The committee trust that every canoeist will attend the meet, coming to stay through the whole or part of the time.

The Anniton C. C., located on the pond, are going to use every effort to make this meet one of the best held. The usual racing events will take place on the 30th, and let every club send as many representatives as possible.

J. B. WATERBURY, Rear-Com.

The A. C. A. Meet.

It will be remembered that while the sentiment of the executive committee in favor of the general vicinity of Grindstone Island was unanimous at the November meeting, no definite point was selected, there being an objection to returning to Stave Island. The choice of site was left to Com. Thorne and the camp site committee, and they have finally decided on Hay Island. This is a small island on the Canadian side, about one and a half miles from Gananoque. It is described as well suited for a camp, in a good location for short canoe trips.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

The Rochester Y. C.

The Rochester Y. C. promises to make the most of the present revival of racing on the Great Lakes through the coming contest for the Canada cup, and is now preparing to take an active part in that contest with its new Genesee. At the same time, a very lively season is expected on Lake Ontario and about the club station, Charlotte, with club and local races, and the open races for the Fisher cup, now held by the club. The club has at the present time the following cups:

The Fisher cup, which was donated to the Chicago Y.C. by A. J. Fisher, July 8, 1882, as a challenge cup. Won by Cora, Royal Canadian Y. C., twice. Then it became the trophy of Atalanta, and was won by Nora twice. On Sept. 19, 1892, it was won by Onward, of the Rochester Y. C., Nov. 1, 1895, it became the bona fide property of the owners of Onward, according to the rules of the Lake Yacht Racing Association. On Nov. 5, 1895, Arthur T. Hazen, Fred S. Todd and J. R. White, the owners of Onward, made a deed of gift of the cup to the Rochester Y. C. on condition that it be a perpetual challenge cup. It has since remained.

The Madge cup was given to the Rochester Y. C. in 1888, by Wolters' Bros., to be awarded to the yacht making the best record in the club's fixtures during that season. It was won by Madge, and was given by her owners to the club, to be raced for each year and awarded to the yacht making the best record in all the club races and cruises for that year.

Won by Vennette in 1890.

In 1891 Vennette, Amelia and Romola each scored the same number of points, and the cup remained in the possession of Vennette.

Won by Nox in 1892.

Won by Nox in 1893.

Won by — in 1894.

Won by Nydia in 1895.

Won by Zarita in 1896.

In 1897 Pedro and Chic each scored the same number of points.

Won by Pedro in 1898.

The Flynn cup was presented to the club by Jerry Flynn, of Charlotte, and became the property of the yacht winning it in the special series of races.

Won by Veritas in 1897.

The Kelpie cup was presented to the club by Col. James S. Graham, to be awarded to the winner of the sealed handicap race on Labor Day of each year.

Won by Kelpie in 1897, fifteen competition.

Won by Majel in 1898, thirteen competition.

The Wright cup was presented to the club by Commodore Alfred G. Wright in 1899, to be awarded to the winner of the cruising race on Memorial Day (May 30) of each year. The winner in this race may be challenged not earlier than thirty days from above date, the winner of second race to hold the cup for the balance of the season.

The McFarlin cup was presented to the club by Mr. McFarlin in 1899, to be awarded to the winner of best two out of three races, one at least to be to windward or leeward and return. Open for all yachts in club under 35 ft. sailing length and over 19 ft., Genesee excepted. Cup becomes the property of the winner. Regular sailing rules and time allowance to apply.

The Hotel Ontario cup was presented by George W. Sweeney, proprietor of the Hotel Ontario, and is open to all yachts on the lake. Regular time allowance and racing rules to apply. The cup becomes the property of the winner. The first race will take place the day after the Fisher cup races.

The last cup was presented at the club meeting last week. The fixtures as arranged are as follows:

May 27.—Opening cruise to Sodus.

May 30.—Cruise from Sodus Bay to Charlotte. The Wright cup will be awarded to the winner of this race.

June 10.—Club race, first, second and third classes, twelve miles; fourth class, six miles.

June 15.—Annual ball.

June 24.—Club race, usual distance for classes.

Sealed handicap race, Tuesday, July 4, 10 A. M.

Saturday, July 15.—Ladies' day and club race; race at 2 P. M., twelve miles for first three classes, six for fourth. Luncheon and hop in evening at club house.

Saturday, July 22.—Ladies' day and club race, 2 P. M.; six miles for all classes.

Saturday, July 29.—Club race, windward and leeward course, ten miles for all classes. This is one of the McFarlin cup races.

Saturday, Aug. 5.—Club race, twelve miles for first three classes, six for fourth and course triangular. A McFarlin cup race.

Monday, Sept. 4.—Sealed handicap race, start at 10 A. M., triangular course, usual division for distance of classes. The Kelpie cup will be awarded to the winner of this race.

Tuesday, Sept. 19.—Clam bake.

Columbia and Defender.

THE work of plating the topsides of Columbia with Tobin bronze is now nearly completed, all but a few sheets at each end are in place, and many of the sheets have been riveted. As they come from the works in Bridgeport the sheets are 2 ft. long and 4 ft. wide. It is expected that the yacht will be ready for launching about June 1, and the operation should be an easy one, very different from the launching of Defender four years ago. The old yacht was launched in the usual way, being shored up on greased sliding ways. It will be remembered that when partly down the ways the yacht stuck, probably owing to some obstruction in the ground ways deep under water, and she was only hauled off with difficulty by powerful tugs after several days work.

The new yacht has been built on a well constructed marine railway, the keel resting in a strong steel cradle on rollers. When the time comes for launching this cra-

dle will be allowed to run down the ways, controlled by a powerful steam windlass and steel cable. The operation is the same as is employed in hauling out and launching much larger and heavier vessels.

On May 2 Capt. Urias Rhodes and Mate Miller, with a crew of thirty-one men, arrived at Bristol from New York and boarded Defender. They will put her in commission as speedily as possible. The men are all Scandinavians, and mostly young. Mr. C. Oliver Iselin was at the shops on the same day, inspecting Defender and Columbia.

The Canada Cup.

THE 35-footer for the Rochester Y. C. syndicate was launched at Hanley's Yard, Quincy, Mass., on May 2, and will proceed to New York, where she will be delivered to her owners, who will take her up the Hudson and by canal to Oswego, thence by Lake Ontario to Charlotte. She has been named Genesee. It has not yet been decided who will be in command, or who will make up the Corinthian portion of the crew.

On the other side of the Lake three boats are well advanced, those building at Hamilton. Much secrecy has been observed concerning them, but something is now known, the following being from a Hamilton dispatch to the New York Tribune:

Owing to the secrecy maintained regarding the construction of all the Canadian defenders which are to take part in the trial races beginning Aug. 7, no information has been obtainable until to-day. Only two of them have been seen. The third racer, being built here, is still kept locked up, owing to the ordering of a seventh yacht from English designs.

The boat for the Victoria Y. C. syndicate is a fin-keel cutter, 44 ft. 4 in. long over all, with 10 in. of beam, and will draw about 5 ft. 2 in. of water. She is built of oak and pine and is finished in cherry and oak. She will be out of the shop in about a week and will be launched on May 10. Her water line length is about 25 ft., and while in no sense a freak boat, she has every indication of being a "hustler." Her canvas area will be 1,500 ft. The ballast on her fin weighs 4,800 lbs.

The second boat seen is also a fin-keel cutter. The exact measurements were not allowed out, but this one seems to be 4 or 5 ft. longer over all than the one first described. She will be not far from 50 ft. in over-all length, and with several more inches of beam than the Victoria boat, and much shallower in the underbody and harder in the bilges. She seems to be a larger edition of Verona, which the same firm turned out last year, and which took eleven first prizes out of eleven starts. She will carry 1,300 sq. ft. of English-made sails.

The third Hamilton boat is described as follows by the Toronto papers:

Messrs. Fearnside and Johnston, who are building a Canada cup defender in Luke Thompson's old boat house, took the peep-proof covers off Monday afternoon long enough to allow a party of friends to see their product. The hull is completed ready for the planking, and shows a very fine racing model. This boat is so different from the Weir and Burnside boats that the difference is easily seen. She is a fin-keel, like the others, but lightness is the first thing that strikes the mind. She looks to be 6 or 8 ft., probably more, shorter than the Weir boat, about as beamy, but much shallower, and with a more sudden turn of the bilge. She is of flush deck construction. The builders will give out no dimensions, but she looks as if she might be 42 or 44 ft. over all, about 10.6 or 11 ft. in beam, and of small draught.

If anything lighter in wood can be found in Canada it will be a marvel. Every stick is like cork, and you could hunt the boat over for a day without finding a knot. With her lightness, however, she will be strong, her scantlings coming fully up to the required specifications. While she does not look freakish, she has much more the appearance of a racing machine than either of the other Hamilton boats.

At Toronto the Duggan boat is well under way, while the McLeod boat is building at Oakville, where Canada was built. The designs for the third boat are expected from Arthur E. Payne, of Southampton, and she will be started immediately.

Kingston Y. C.

KINGSTON, Ont., May 6.—At the annual meeting of the Kingston Y. C., held on Monday evening, the 1st inst., the following gentlemen were elected officers for the ensuing year. Com., Dr. Allan Black; Vice-Com., W. Bruce Carruthers; Rear-Com., Jas. H. Macnee; Sec'y, T. J. Rigney; Treas., J. E. Cunningham.

The Yachtsman gives the following interesting particulars of the original "Will Fife" of yacht building fame: "There was buried in Largs last week the man who discovered and gave to the world the first chapter in the deeply interesting history of the evolution of yacht building at Fairlie, namely, the Rev. John Boyd, M.A., minister of the United Presbyterian Church at Wemyss Bay. The story as Mr. Boyd told it is briefly as follows: 'William Fife, a mill and wheelwright of Kilbirnie—a small parish eight miles inland from Largs—settled in Fairlie toward the end of the last century. He had a son, also William by name. This young man was acquiring the craft of mill and wheelwright under his father when a strong longing to go off into the Bay of Fairlie and inspect the vessels that often came to there, seized him. Having no boat in which to carry out his desires, he boldly set to and built one. So well did he build her that she was speedily bought from him. When several more that he built in rapid succession were quickly bought up, it dawned on him that boat building, rather than the construction of carts, was his true vocation; and, much to his father's vexation, a yacht and boat builder he became. And so was founded, rather more than a hundred years ago, the now world-famous business. The present head of the Fairlie firm is a son of the founder of it, and the designer of Shamrock is a grandson of (for yachting purposes) William Fife I.'

Small Yachts in Germany.

THERE was a time many years ago when yachting in Germany was confined very largely to the "bubfish" boats, open center board skimming dishes imported from New York, some of the best being built by Capt. Bob Fish, whence the name. At the present time Germany has no need to go abroad for her yachts, as was shown last year in the 65-footer Kommodore, and though the conditions are not favorable to the construction of many very large yachts, the German designers have shown in the smaller classes their ability to do good work. The two designs here shown were selected at random from The Wassersport, as good boats that in size are well within the powers of the young amateur, who, if he once succeeds in building one of them, will be able to feel that he has a yacht to sail in and not a coffin. They are not racing craft, and neither was designed with a view to great speed. The first one is the work of the clever Hamburg designer, Max Oertz, and was designed for the one-design class of the Royal Danish Y. C., at Copenhagen. The design shows a fine little keel single-hander, a thoroughly safe boat for the novice. Her dimensions are:

Length—	
Over all	22ft 2in.
L.W.L.	14ft. 9in.
Beam	5ft. 6in.
Draft	2ft. 6in.
Mainsail	195 sq. ft.
Jib	80 sq. ft.
Lead keel	0.50 ton.

The original scale is of course in metres, but a scale of 1/4 in. equals 1 ft. will give from this drawing a boat of 15 ft. 6 in. l.w.l., with other dimensions enlarged in proportion.

The other yacht was designed for single-hand work, and is of the following dimensions:

Length—	
Over all	21ft 8in.
L.W.L.	14ft. 5in.
Beam	5ft. 11in.
Draft—	
With rudder	1ft. 8in.
With centerboard	4ft. 3in.
Mainsail	204 sq. ft.

A scale of 3/8 in. applied to this drawing will give a waterline 15 ft.

YACHTING NEWS NOTES.

Mr. Arthur Curtis James, one of the joint owners of the new auxiliary brigantine Aloha, now nearly plated at the Erie Basin drydocks, has just passed a very successful examination before the United States local inspectors, at New York, and received his license as master. During his ownership of Coronet, schr., Mr. James devoted himself to the study of navigation, and he has been for some years a student of Capt. Howard Patterson. He will command his new ship himself.

The Kingston Y. C., of Kingston, Ontario, has elected the following officers: Com., Dr. Black; Vice-Com., W. B. Carruthers; Rear-Com., J. H. Macnee; Sec'y, T. J. Rigney; Treas., E. Cunningham; Regatta Committee, Messrs. Burns, Mowat, Conway and Com. Black; General Committee, E. Burns, H. W. Richardson, S. Calvin, W. C. Kent and F. M. Strange; Auditors, R. E. Burns and A. C. Johnston.

The Jamaica Bay Y. C. held its annual meeting on May 4, and elected the following officers: Com., Henry F. Hewlett; Vice-Com., Benjamin F. Daly; Rear-Com., Oscar M. Lipton; Fleet Capt., Frederick S. Lafond; Treas., M. H. Christopher; Chairman House Committee, George A. McDermott; Chairman Regatta Committee, John C. Lefferts; Chairman Membership Committee, Conrad V. Dykeman; Chairman Entertainment Committee, F. L. Johan; Board of Directors, John J. Jones, R. H. Pforr and Charles Solomon; Fin. Sec'y, James E. Lent; Recording Sec'y, Charles P. Daly.

The following dates have been agreed upon by R. C. Y. C., National Club, Q. C. Y. C., Parkdale Club and the Royal Toronto Sailing and Skiff Club, on which each club will race under the auspices of the Lake Sailing and Skiff Association: May 24, R. C. Y. C.; June 10, National; July 15, Q. C. Y. C.; Aug. 5, Parkdale; Sept. 9, Royal Toronto Sailing and Skiff Club. Mayor Shaw has donated a silver cup for the 16-footer making the best average in the five regattas. Cups will also be given for boats making the best averages in the other classes.

The new royal yacht, Victoria and Albert II., will be launched this week at Pembroke Dockyard, England. She will surpass anything of the kind yet floated, being a yacht and not a warship.

A Manual on Laying-Off Iron, Steel and Composite Vessels, by Thomas H. Watson, has recently been published by Longmans, Green & Co., London and New York. Mr. Watson, the inventor of the double sliding rule for calculating displacement, tonnage, speed and indicated horse-power, is the lecturer on naval architecture at the Durham College of Science, Newcastle-upon-Tyne, England, and also a member of the North East Coast Institution of Engineers and Shipbuilders. In this new work, a large octavo volume, illustrated by numerous folding plates, he describes the methods of laying off on the mould loft floor all classes of vessels, sail and steam, for commerce or war, and of iron, steel and composite construction. The various processes of this enlarged form of marine drafting are described clearly and plainly, with the aid of diagrams; the methods of obtaining the true shape of every portion of a vessel being given in detail. The various subjects covered include the laying off of the sheer draft, the cant frames, the decks, beam camber, etc., the floor and double bottoms, the shell plating, including the lining off the model, obtaining sight edges, etc., obtaining the true form of the plating, the scribe board, rib bands and harpins, moulds, poop round and turtle-back, stringer plate and beam knees, iron and steel mast, and many minor details. The book is written plainly and simply with no formulas nor complicated calculations, and is quite within the comprehension of those for whom it is primarily intended, young draftsmen and apprentices and students of ship building. At the same time it is so complete and thorough as to make it a valuable aid to the more expert draftsmen and builders.

ONE-DESIGN YACHT BY MAX OERTZ, HAMBURG.

A GERMAN SINGLE-HANDER.

A GERMAN SINGLE-HANDER.

ONE-DESIGN YACHT BY MAX OERTZ, HAMBURG.

Coronet, schr., F. S. Pearson, has been sold to John I. Waterbury, of New York, owner of Saxon, schr.

On May 4 the steam yacht Niagara, Howard Gould, sailed from New York on a long cruise to the Azores, England Scotland and Norway. Mr. and Mrs. Gould and a party of friends are on board, and Capt. Shackford is in command.

The Corinthian Y. C. of Philadelphia has arranged to make important improvements at its station, Essington, on the Delaware River. A large basin will be constructed, with storehouses, workshop, etc., giving all facilities for the care of yachts in summer and winter. The estimated cost is \$16,000.

The Columbia Y. C., of Chicago, has organized the Columbia Yacht Club Construction Company, for the purpose of financing its new club house, 60 by 100ft., which will be ready early in the season.

The Bay Yacht Club is a new organization, just formed in Bay Ridge, with a station at the foot of Fifty-sixth street. The officers are: Com., James J. Haaren; Vice-Com., Peter J. Hackey; Fleet Capt., Edward McGlone; Meas., John J. Tierney; Pres., Thomas Garrity; Vice-Pres., Jacob Hass; Sec'y, Michael Malone and Treas., William C. Copley; Regatta Committee, Edward McGlone, Chairman; Michael Malone and John J. Brown.

The officers of the Yale Corinthian Y. C. for 1899 are: Com., John T. Archbald, '99 S.; Vice-Com., E. A. McCullah, '99 S.; Rear-Com., F. C. Havemeyer, 1900, and Sec'y and Treas., T. E. Franklin, 1900. The club has leased a new house at Morris Cove, near the Pequod Club.

Dragoon, sloop, F. M. Freeman, recently sold to Julian Schley and a syndicate of Savannah yachtsmen, has arrived at that port, being taken from New Rochelle through the canals and the Chesapeake by T. F. Day, C. G. Davis and H. Percy Ashley, with a paid hand. The yacht, one of the fastest of the Larchmont 34ft. special class, will represent the Savannah Y. C. in the coming race for the interstate challenge cup, now held by the Carolina Y. C.

One of the best technical journals among our many exchanges is *Marine Engineering*, the monthly published in New York. It is now running a series of very interesting articles on American "Schools of Marine Construction," the first paper, in the April issue, describing the U. S. Naval Academy, at Annapolis, and the May number dealing with Sibley College, Cornell University.

If You Want the Whitest and Best

WHITE LEAD use "ENGLISH B. B." Of all paint dealers and of J. Lee Smith & Co., 59 Frankfort street, and F. W. Devoe & C. T. Reynolds Co., 101 Fulton street, New York.—*Adv*

Rifle Range and Gallery.

Sept. 4.—Sea Girt, N. J.—Meeting of the New Jersey State Rifle Association. De Lancy G. Walker, Sec'y.

Brooklyn and Louisville Revolver Match.

NEW YORK, April 29.—On April 25 a revolver match was shot between the Brooklyn Revolver Club and the Louisville, Ky., Revolver Club, the scores being telegraphed from city to city at the close of the match. The conditions were, teams of ten men each, distance 15yds., target 4in. black counting 10, concentric rings outside of this at 1in. interval counting from 9 to 1. Thirty shots to be fired by each contestant in 5-shot strings, 20 seconds being allowed for each string, taking time from the first shot. Mishfires or disabling of weapon caused the string to be discarded and another shot in its place. Any weapon allowed. Ammunition full charge factory ammunition, for which the piece is chambered.

Scores of Brooklyn Revolver Club, April 25:

	10	10	10	10	9-49	Seconds.
Wendlestadt	10	10	10	10	9-49	16
(S. & W., .32, police, Smokeless, U. M. C.)	10	10	9	8	7-44	16
	10	10	10	8	8-46	19
	10	10	10	9	8-47	19
	10	10	9	8	8-46	18
	10	10	10	8	7-45	19

*Hopkins	9	8	7	4	3-31	16
(S. & W., .32, police, Smokeless, U. M. C.)	9	9	7	6	0-31	20
	9	8	7	6	6-36	19
	10	9	9	8	6-42	19
	10	9	8	7	4-38	18
	8	8	6	6	6-34	17

**Tayntor	10	10	9	0	0-29	10
(Merwin & Hubert, long, .32, U. M. C., black, used as double-action.)	10	10	10	7	5-42	17
	10	10	10	9	8-47	16
	9	8	8	8	7-40	19
	10	7	7	6	3-37	20
	10	10	10	9	7-46	19

* Began with S. & W. .44, with U. M. C. Smokeless, but, having had the cylinder jam twice in succession, discarded it and shot as above mentioned.

** Had mishfires on two strings owing to too delicate a main spring, causing strings to be shot over. On a third string the target fell after the third shot and began swinging, causing last two shots to miss target. A fresh string was allowed for this.

Jenks	10	9	8	8	7-42	18
(S. & W., .38, military, U. M. C., Smokeless)	10	10	8	8	7-43	17

Grand total, 2,681; Louisville score as telegraphed, 2,369. Brooklyn wins by 312.	REGINALD H. SAYRE.					

Cincinnati Rifle Association

CINCINNATI, O.—The following scores were made by members of the Cincinnati Rifle Association in regular competition, at Four-Mile House, Reading Road, April 30, 1899. Conditions: 200yds., off-hand, at the German ring target. Payne led on the champion target with 217. Hasenzahl wins the Dietrich medal for April with a score of 71 on the honor target. Weather warm and gusty, 2 to 4 o'clock wind. A team of eight men of this Association shot a telegraph match with a team of eight of the St. Louis Club. The Cincinnati team scored 4,040 points.

Champion score:											
Gindele	23	24	24	25	17	19	18	21	22	14	—207

Rifle at Shell Mound.

SAN FRANCISCO, April 24.—There was a goodly attendance at Shell Mound range yesterday, but the day proved a very stormy one, necessitating frequent changes in wind gauges.

The North German Schuetzen Club held a monthly medal shoot.

Champion class, F. P. Schuster, 429; first class, J. Gefken, 402; second class, J. Lenkenau, 371; third class, O. Schinkel, Jr., 324; fourth class, J. Woeckel, 359; best first shot, H. Burfeind, 24; best last shot, H. Burfeind, 24.

Columbia Pistol and Rifle Club, 50yds., Columbia target, Siebe pistol medal: C. M. Daiss, 42, 48, 44; F. O. Young, 47, 49, 48, 53; A. H. Pape, 66.

Lewis revolver trophy: F. O. Young, 49, 56, 59; J. E. Gorman, 49, 57.

Daiss all comers' and Jacobson members' medal, 22 and 25 rifle: E. Jacobson, 18, 23, 23, 25; George Mannel, 23, 30, 30.

All comers' rifle medal: D. W. McLaughlin, 40, 58; F. E. Mason, 53, 62; F. O. Young, 60, 61; R. Stettin, 91, 98.

Members' rifle medal: G. Mannel, 93, 95.

German Schuetzen Club in monthly bullseye shoot: Dr. L. O. Rodgers, 226, D. B. Faktor 291, R. Stettin 306, F. Rust 391, A. Jungblut 496, H. Hellberg 598, H. Likendey 681, George H. Bahrs, 682, F. P. Schuster 706, J. D. Heise 776; Charles Thierbach, 782, J. T. Bridges, 1,076.

Bushnell medal, 10 shots, no re-entry: F. P. Schuster 216, Dr. L. O. Rodgers 215, D. B. Faktor 214, E. H. Goetze 269.

Competition for cash prizes, 3 shots, re-entry: Dr. L. O. Rodgers 73, J. Utschig 72, D. B. Faktor 70.

San Francisco Schuetzen Verein, monthly bullseye shoot: J. C. Waller 84, Lieut. E. Ipsen 354, Charles Thierbach 394, William Ehrenfort 426, John Gefken 496, Frank Koch 509, D. B. Faktor 513, John Utschig 537, F. Rust 563, A. Lamaire 598, J. D. Heise 602, D. Dunker 637, Capt. J. Thode 651, August Pape 664, Otto Lemcke 669, H. Burfeind 728, Louis Bandel 735, George H. Bahrs 831, R. Stettin 955, H. Stelling 1,058.

ROBEL.

Trap-Shooting.

Fixtures.

May 9-13.—Peoria, Ill.—Illinois State Sportsmen's Association's tournament. C. F. Simmons, Sec'y.

May 13.—Dunellen, N. J.—Shoot of the New Jersey Central League.

May 16-20.—St. Louis, Mo.—Tournament of the Missouri State Fish and Game Protective Association. H. B. Collins, Sec'y.

May 17.—Brooklyn, L. I.—John Wright's prize shoot at targets; commences at 10:30.

May 17-18.—Oil City, Pa.—Interstate Association's tournament, under auspices of Oil City Gun Club. F. S. Bates, Sec'y.

May 18.—West Chester, Pa.—Annual spring shoot of the West Chester Gun Club. F. H. Eachus, Sec'y.

May 23-25.—Macon, Miss.—Eleventh annual tournament of the Noxubee Gun Club; targets and sparrows; \$500 in merchandise and cash added. C. M. Seales, Manager.

May 23-25.—Algona, Ia.—Tournament of the Iowa State Association for the Protection of Fish and Game. John G. Smith, Pres.

May 24.—Elkwood Park, N. J.—Contest for E. C. cup, emblematic of championship of State of New Jersey, between Messrs. Phil Daly, Jr., and T. W. Morley.

May 26-27.—Tyrone, Pa.—Target tournament of the Tyrone Gun Club. D. D. Stine, Sec'y.

May 30.—Rutherford, N. J.—Decoration Day shoot of the Boiling Springs Gun Club; good prizes. W. H. Huck, Sec'y.

May 30.—Canajoharie, N. Y.—All-day target shoot at Canajoharie, N. Y. Charles Weeks, Sec'y.

May 30-June 2.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. Frank W. Bacon, Sec'y.

May 30.—Newburgh, N. Y.—Decoration Day shoot of the Glenwood Gun Club. Open to all. C. Hoppenstedt, Sec'y.

May 30.—Winona, Minn.—Winona Sportsmen's Club's tournament.

May 30.—Haverhill, Mass.—All-day shoot of the Haverhill Gun Club. C. F. Lambert, Sec'y.

May 30-31.—Buffalo, N. Y.—Decoration Day shoot at Audubon Park.

June 3.—New Haven, Conn.—Yale vs. Princeton.

June 3-4.—Sheboygan, Wis.—Sheboygan Rod and Gun Club's tournament.

June 5-10.—Buffalo, N. Y.—New York State shoot, under the auspices of the Buffalo Audubon Gun Club; \$1,000 guaranteed; over \$2,000 in merchandise, and \$1,000 added money in open events. Chas. Bamberg, Sec'y, 51 Edna Place.

June 6-9.—Sioux City, Ia.—Fifth annual amateur tournament of the Soo Gun Club. E. R. Chapman, Sec'y.

June 7-8.—Crawfordsville, Ind.—Indiana Trap-Shooters' League tournament, under auspices of Crawfordsville Gun Club.

June 10.—Princeton, N. J.—Yave vs. Princeton.

June 13-14.—Grand Forks, N. D.—Fifth annual shoot of the North Dakota Association.

June 14-15.—Bellows Falls, Vt.—Interstate Association's tournament, under auspices of Bellows Falls Gun Club. C. H. Gibson, Sec'y.

June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.

June 20.—Ogden, Ill.—Ogden Gun Club's annual tournament.

June 20-22.—Wheeling, W. Va.—Third annual tournament of the West Virginia State Sportsmen's Association, under the auspices of the Wheeling Gun Club, Wheeling, W. Va. John B. Garden, Sec'y.

June 21-23.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under the auspices of the Sherman Rod and Gun Club. J. C. Porterfield, Sec'y, O. T. S. L.

June 27-29.—Altoona, Pa.—Target tournament of the Altoona Rod and Gun Club, Wopsonock Heights. G. G. Zeth, Sec'y.

July 1.—Sherbrooke, P. Q.—Annual tournament; targets; Dominion Day; open to all amateurs. Chas. H. Foss, Sec'y.

July 1-2.—Milwaukee, Wis.—Grand tournament of Milwaukee Gun Club, in Carnival Week. S. M. Du Val, Sec'y.

July 4.—Pawling, N. Y.—All-day tournament of the Pawling Rod and Gun Club; targets.

July 18-20.—Little Rock, Ark.—Arkansas State tournament.

July

In his report of the Nebraska State tournament, Mr. Paul R. Litzke mentions a phenomenal squad record, five men breaking 20 targets each, making thereby a score of 100 without a miss. The men were Messrs. Rogers, Daniels, Duer, Young and Parmelee.

There will be a great contest in St. Louis next week, and there is a probability of lively times to follow in the effort to readjust possession of the different trophies by men who can shoot, want to shoot and will shoot.

At the Kansas City shoot it was suggested that efforts be made to match the two grand veterans of the sport, Capt. Money and Capt. Sedam, in a pigeon contest of 100 birds. It was further proposed that this contest take place during the Missouri State tournament at St. Louis.

In the report of the Boston Gun Club's shoot is some admirably sound, though gentle criticism on high scores, which are considered merely as high scores apart from the true sport of trap-shooting. Read it and observe it.

We have received a photograph of the squad which broke the world's record in competition at the Peru tournament, but too late for publication this week. Next week we will be pleased to publish a reproduction of it.

Mr. W. C. Collins, secretary of the Greenville Gun Club, Kell's Point, Jersey City, N. J., informs us that his club will shoot every Saturday till further notice.

On Saturday of this week, at Elkwood Park, Long Branch, N. J., there will be a live-bird handicap, 20 live birds, \$10 entrance, handicaps from 25 to 32yds. Plenty of birds are on hand for sweepstakes.

The new board of trustees of the Chicago challenge trophy, elected recently are: Messrs. F. H. Lord, chairman; Wm. B. Leffingwell and F. A. Bissell.

At the Osceola shoot, Heikes and Gilbert tied for general average on targets. Charley Budd beat them all at pigeons, killing 25 straight in the handicap.

The third annual May tournament will be held at Audubon Park on May 30 and 31. There are ten target events each day. W. C. Garbe, Manager.

The Brooklyn Gun Club, John Wright, manager, will hold its monthly shoot on Saturday of this week.

Mr. Elmer E. Shaner, manager of the Interstate Association, was in New York a few days early this week.

BERNARD WATERS.

The Inanimate Target Championship.

THE inanimate target championship and the E. C. trophy that goes with that title, are both held by Rolla O. Heikes at present. It is possible, however, that the title and trophy may have another owner shortly, as the American E. C. & Schultze Gun Powder Co. has signified its intention of redeeming the trophy and putting it up for open competition at the Missouri State shoot, which is to be held at St. Louis, May 16-20 next.

As is well known, the conditions of all open competitions for this trophy are as follows: 100 targets, unknown angles; 100 targets, expert rules, one man up, and 50 pairs, or 300 targets in all.

The trophy was first put up for competition by the company above mentioned at its tournament, May 5-8, 1896, held at Guttenburg, N. J. Since that time there has been one other open competition for the trophy, and four individual matches, making six contests in all. Strange as it may seem, notwithstanding all the excellent target shots there are in the country, the trophy has never been held by anybody except Heikes or Gilbert. In fact, with the solitary instance of Fulford's challenge to Heikes late last year, no one else has ever put in any claim for the championship.

Records of Past Contests.

In view of the coming contest at St. Louis, the following records of all contests for the championship will be of interest:

First contest.—Open competition at Guttenburg, N. J., May 5-8, 1896. Won by Fred Gilbert; J. A. R. Elliott and E. D. Fulford tied for second and third; R. O. Heikes fourth. Their respective scores were:

	Unknown.	Expert.	Pairs.	Total.
Fred Gilbert.....	91	81	84	256
J A R Elliott.....	96	80	85	261
E D Fulford.....	91	88	82	261
R O Heikes.....	92	89	77	258

Second contest.—Heikes challenged Gilbert, the match taking place at Watson's Park, Chicago, Aug. 20, 1896. Heikes won. Scores as follows: (Conditions were 50 targets at each style of shooting.)

	Unknown.	Expert.	Pairs.	Total.
Heikes.....	48	45	40	133
Gilbert.....	47	44	39	130

Third contest.—Gilbert challenged Heikes, the match being shot at Dayton, O., on the grounds of the Buckeye Gun Club, July 31, 1897. Gilbert won. Scores as follows:

	Unknown.	Expert.	Pairs.	Total.
Gilbert.....	48	48	46	142
Heikes.....	47	44	45	136

Fourth contest.—Heikes challenged Gilbert, the match being shot at Watson's Park, Chicago, Aug. 13, 1898. Heikes won. Scores as follows:

	Unknown.	Expert.	Pairs.	Total.
Heikes.....	48	48	44	140
Gilbert.....	47	45	45	137

Fifth contest.—After the above match, the trophy was redeemed by the American E. C. & Schultze Gun Powder Co., and put up for open competition at a tournament held at Dayton, O., Oct. 11-13, 1898. The conditions were the same as prevailed at the Guttenburg tournament, May 5-8, 1896, on this occasion Heikes won somewhat easily, with Fulford and Harvey McMurchy tied for second and third; J. S. Fanning was fourth, with Gilbert in fifth place. Scores were:

	Unknown.	Expert.	Pairs.	Total.
Heikes.....	87	98	85	270
Fulford.....	88	94	84	266
McMurchy.....	91	93	82	266
Fanning.....	88	90	84	262
Gilbert.....	94	93	74	261

Sixth contest.—Fulford challenged Heikes, the match being shot on the grounds of the Keystone Shooting League, Holmesburg Junction, Pa., Jan. 21, 1899. Heikes won. Scores as follows:

	Unknown.	Expert.	Pairs.	Total.
Heikes.....	45	43	41	129
Fulford.....	42	45	36	123

The Dupont Trophy.

THE Du Pont trophy, which is to be contested for at St. Louis next week, offered for competition by E. I. du Pont de Nemours & Co., was first started at an open tournament held at Baltimore, Md., on Oct. 23, 1895. Fifty-one contestants entered. Charles Macalister, of Baltimore, and Fred Gilbert, of Spirit Lake, Ia., tied on 25. In the shoot-off Gilbert won, 5 birds to 4.

On April 4, 1896, J. W. Budd, of Pemberton, N. J., and Fred Gilbert shot the first individual race for the possession of the cup at Watson's Park, Burnside, Ill. Gilbert won; score, Gilbert 92, Budd 74.

Second contest, Watson's Park, June 1, 1896: Fred Gilbert vs. Geo. L. Deiter, of Milwaukee, Wis. Scores: Deiter 84, Gilbert 83. The third race took place at Milwaukee, Wis., July 8, 1896, Gilbert vs. Deiter. Scores: Gilbert 96, Deiter 88.

The trophy was again offered in open competition at the Du Pont tournament, held at Chicago, Aug. 3-8, 1896. There were 224 entries. B. W. Claridge, Baltimore, Md.; W. R. Miller, Texas; H. D. Kirkover, Buffalo, N. Y.; Geo. Roll, Blue Island, Ill.; and Chas. Gottlieb, Kansas City, Mo., tied on 25. Claridge won the shoot-off with 5 straight kills.

The fourth individual match, at Baltimore, Md., on Oct. 6, 1896, was between B. W. Claridge, and J. C. Malone, of Baltimore. Scores: Claridge 47, Malone 43, out of 50.

The fifth match was at Baltimore, Md., on Nov. 10, 1896, 50 birds to the man. B. W. Claridge vs. Geo. Roll, of Blue Island, Ill. Scores: Roll 48, Claridge 45.

The sixth contest was at Watson's Park, Burnside, Ill., on Dec. 16, 1896; Geo. Roll vs. J. L. Winston, of Washington, Ind. Scores: Winston 91, Roll 84.

The seventh contest, between J. L. Winston and Geo. A. Mosher, of Syracuse, N. Y., took place at Yardville, N. J., on Jan. 16, 1897. Scores: Winston 87, Mosher 85.

The eighth race was shot at Chicago, Ill., on May 1, 1897, at 100 birds per man, between J. L. Winston and Chas. W. Budd, of Des Moines, Ia. Scores: Budd 86, Winston 85.

The ninth contest was between Chas. W. Budd and Geo. W.

Beck, of Indianapolis, Ind., and was shot at Burnside, Ill., on June 8, 1897. Scores: Budd 91, Beck 79.

The tenth contest took place at Eau Claire, Wis., Aug. 28, 1897, 100 birds per man, between Chas. W. Budd and J. A. R. Elliott, of Kansas City, Mo. Scores: Elliott 99, Budd 94.

The eleventh match was held at Kansas City, Mo., on Oct. 22, 1897, between Fred Gilbert, of Spirit Lake, Ia., and J. A. R. Elliott, 100 birds per man. The score was a tie at 97. Gilbert won the shoot-off at 25 birds. The score standing: Gilbert 25, Elliott 24.

The twelfth contest was again between Gilbert and Elliott, and was shot at Watson's Park, Burnside, Ill., on Dec. 9, 1897. The score was a tie at 93 out of 100. In the shoot-off next day at 25 birds, Elliott won. Scores: Elliott 25, Gilbert 21.

The thirteenth contest was also between Gilbert and Elliott, and was shot at Dexter Park, L. I., on Jan. 15, 1898. Scores: Gilbert 96, Elliott 91.

The fourteenth race for the cup was shot at Chicago, Ill., on April 14, 1898, between Fred Gilbert and Frank Parmelee, of Omaha, Neb. Scores: Gilbert 86, Parmelee 82.

The fifteenth race was again between Fred Gilbert and J. A. R. Elliott, and was held at Chicago, on Sept. 24, 1898. Scores: Gilbert 97, Elliott 94.

ON LONG ISLAND.

Oceanic Rod and Gun Club.

Rockaway Park, L. I., May 1.—A strong wind blowing from the score to the traps made the targets skip and jump after the manner of lambs in springtime. The Oceanic Gun Club was holding its last shoot of the season, and, different from its last two or three prior shoots, delightful weather favored it. There were not sufficient members of one team to make the necessary contest, so a nine-men team race was made up between New York and New Jersey, with the result that the latter won by 6 targets; score, 158 to 152. The scores were:

New York State—Scott 16, Woods 15, Jennings 18, Stoney 20, Charles 15, Diffley 15, Leoble 13, Laney 19, Waters 21—152.
New Jersey State—O'Brien 16, Van Dyne 18, Schields 18, Larkey 16, Coleman 17, Hesse 20, Jones 13, Dr. Bell 22, Hassinger 18—158.

After the club shoot six 10-target events were shot.

The Altoona Shoot.

ALTOONA, Pa., May 5.—Editor Forest and Stream: The programme for the two days' target tournament, to be given by the Tyrone Gun Club is ready for distribution. Copies can be had by writing to D. D. Stine, secretary, Tyrone, Pa. There are ten events for each day. On Friday, May 26 events Nos. 1, 2, 6, 8 and 10 are at 10 singles, \$1 entrance; Nos. 3, 5 and 9, 15 singles, \$1.50; Nos. 4 and 7, 20 singles, the former \$2 entrance and the latter four-men club team race, class shooting, three moneys, \$2. Saturday, the 27th, events Nos. 1, 2, 4, 6 and 9, are at 10 singles, entrance \$1; Nos. 3 and 7, 15 singles, \$1.50; No. 5, 25 singles, \$2.50, and No. 8, 20 singles, \$2.

The equitable system of dividing purses (with the exception of event No. 7, first day) will be used; in 10-target races, four moneys; 15s, five; 20s, six; and 25s eight. A magatrap will be used, and targets will be thrown at 1½ cents each. Guns and ammunition shipped to the secretary will be delivered to the grounds free.

A number of shooters from the Altoona Rod and Gun Club will attend the State shoot at Erie.

For the benefit of shooters in this vicinity who cannot go to the State shoot, the Altoona Club will hold a target tournament on their Lyswen grounds on Decoration Day. The programme, which is now ready for distribution, announces six 10-single, \$1 entrance, three 15-single, \$1.50 entrance, and a 5-pair, \$1 entrance event. Equitable system, four moneys in 10, and five moneys in 15-target events. Targets will be thrown at 1½ cents each. Shooting begins at 9 o'clock. Visiting shooters should send shells, etc., to G. G. Zeth, secretary. Electric cars run from the central part of the city directly to the grounds.

The Altoona Club has the second magatrap, and will have a third one in operation during the big shoot in June at Wopsononock Heights. We venture the assertion that there is not a club in the country with the facilities for shoots that this organization has.

A very pleasant caller in shooting circles the other day was W. L. Colville, of Batavia, N. Y., who is sowing seeds for Du Pont powder trade. Sportsmen who have the pleasure of Dick Swiveler's acquaintance, know him only as an ardent lover of nature, a profound friend and advocate of legitimate sport, and the possessor of a personality gentlemanly in the extreme. An Altoona party accompanied him up the mountain to Wopsononock Heights, the scene of the June tournament, and spent the afternoon at shooting and sight-seeing.

Mr. Colville's visit here recalls some memories of the days when trap-shooting was in its infancy. He was associated about twenty years ago with Palmer O'Neil, of Pittsburgh, then the leading sporting goods dealer in western Pennsylvania. In those days we bought glass balls from him, and later the Legowsky target. The latter you might hit sometimes with a full charge of shot and knock it into the next lot without scoring a break.

G. G. ZETH.

Malone Defeats Smith.

BALTIMORE, Md., May 4.—In a match at 100 live birds for \$200 a side, Mr. James R. Malone, captain of the Baltimore Shooting Association, defeated Mr. Edward T. Smith, of Ballston, N. Y., by the score of 89 to 79. Each stood at 30yds. Boundary 50yds.

The birds were the best trapped on the grounds of the Baltimore Shooting Association this season. There was a fair wind blowing from the southwest. Mr. Charles Macalister refereed the race, and there was no hitch from start to finish. Each principal generously congratulated the other on the difficult kills, and Mr. Smith was the first to congratulate Mr. Malone on his victory.

Mr. Smith expressed a wish for a return match in the fall. He expects to be absent from Baltimore during the summer. While Mr. Smith is almost a stranger in Baltimore, he in a short time proved himself to be a thorough sportsman and an accomplished athlete, having defeated some of the best local talent in several branches. He has made application to join the Baltimore Shooting Association, although he spends but few months of the fall and spring in Baltimore.

Mr. Smith's first shooting here was last January, when he made a run of 32 straight kills. He then went to Macon, Ga., for the winter, where he had good sport killing ducks and field birds. He took part in the Maryland Sportsmen's Exposition shooting at Prospect Park; and while there he beat Phil Daly, Jr., in a 10-bird race. At the Baltimore Shooting Association tournament last week he killed 10 straight in the introductory handicap and graced 13 out of 15 in the Philico handicap. Mr. Smith is a member of the Maryland Club, the Green Spring Valley and Elkridge clubs, and also of the Riverton and Larchmont shooting clubs. Many club men backed Mr. Smith to beat Mr. Malone, and the B. S. A. men who backed their captain won considerable money. The scores:

IN NEW JERSEY.

East Side Gun Club.

Newark, N. J., May 4.—The club shoot of the East Side Gun Club took place to-day. The conditions were 25 targets, point system. The targets were thrown hard, and there was a strong 5 o'clock wind, which made them erratic. Following are the scores:

G H Piercy, 18 points.....	11011111111110010111101—20
W Hassinger, 18.....	11110111101001001111111—19

* Five pairs.

Championship of New Jersey.

May 6.—At Passaic, to-day, on the grounds of the Passaic City Gun Club, the contest between Capt. A. W. Money, the holder, and Mr. Phil Daly, Jr., challenger, took place with a large and interested audience to witness the struggle for possession of the elegant E. C. trophy, emblematic of the championship of the State of New Jersey. The day was delightful in respect to weather, clear, pleasantly cool, with wind so gentle that it had no disturbing effect on the targets. The light, while good, was variable, and later in the afternoon, was hazy.

Peru Gun Club Tournament.

PERU, Ind., May 6.—The third annual tournament of the Peru Gun Club, which was held here on May 2 and 3, did not differ materially from the first and second annuals of the same club, which were held upon the same grounds in 1897 and 1898, except that the attendance was not quite so large as upon the two former occasions. However, considering the great number of sportsmen who are barred from participating in tournaments just at this season on account of the rush of business in various lines, caused by the lateness of the spring season, and considering that quite a few shooters every year come to the conclusion that they can never become experts, and hence cease to attend tournaments, the attendance was highly satisfactory to the management and all the participants, and I predict was one of the most successful tournaments which will be given in the Middle West during the season of 1899.

As usual the weather conditions at Peru during the tournament were absolutely perfect. In fact, the Peru Gun Club seems to stand well with the weather clerk, as during their three annual tournaments of two days each there has been six as fine days for shooting as the most chronic kicker could wish.

On the evening of May 1, or the day preceding the tournament some familiar faces began to show up on the incoming trains, though the first sportsman to appear was a stranger to us in the shape of Mr. L. J. Squier, of Cincinnati. However, he made himself pretty well known at the scores before he got out of town. In fact, the way he dallied with the straights began to be a familiar sight before the tournament was a half-day old. Among the first of the old guard to appear were Messrs. G. E. Bruner and Elmer Apperson, he of the motorcycle fame, of Kokomo, Ind. Next to arrive was Mr. John Parker, of Detroit, Mich., who as manager of tournaments and as the popular representative of the Peters Cartridge and King Powder Company, of Cincinnati, is too well known to need further mention. However, the Peru Gun Club would not hold a shoot without Jack. Messrs. Shepardson and Streeter, of La Grange, and Mr. M. J. Smith, of Huntington, completed the list of earlier arrivals. They were all upon the grounds early the following morning, anxious and eager to get at the festive bluerock, and before the regular programme was begun four extra races, three of 10 birds and one of 15 was shot off in rapid succession, the scores of which will appear below. Those already on the grounds were soon joined by Messrs. H. W. Cadwallader, of Danville, Ill.; D. D. Smith, Garrett, Ind.; Al Bussell, Leesburg, Ind.; John A. Ruble, Chicago; F. D. Alkire, Woodlyn, O.; Ed Rike, Dayton, O.; J. S. Boa, Chicago; Chas. W. Townsend, Knox, Ind.; Fred Anson, Huntington, Ind.; and about the same time a telegram was received from Mr. Edgar Apperson, of Kokomo, stating that he was lost in the wilds of Fort Wayne, but to hold the programme open until the 11:45 train, as he wanted in. This was supplemented by a 'phone from Mr. F. H. Snow, of Brooklyn, O., who stated that he was in the same boat with Mr. Apperson, and would come in on the same train. At 10:15 A. M., the L. E. & W. north-bound train stopped right opposite the grounds to let off some shooters and a company of rough walkers, which would have excited the admiration of Theodore Roosevelt himself charged across the Commons to join the crowd already at the score. They were led by Lieut.-Col. O. F. (Partington) Britton, and consisted of Mr. E. E. Neal, Bloomfield; E. H. Tripp and Thomas F. Parry, who, with Dr. Britton, represented Indianapolis; Fred Erb, Jr., and Joe Blistan (Slow), of Lafayette; Mac Stilwell, secretary Indiana Trap-Shooters' League, Crawfordsville; Messrs. Wallace and Benson, Kokomo, and Messrs. Lochary, Cooley and Forbis, of Hartford City. The scores of these gentlemen for the first day are appended herewith:

Scores, First Day, May 2.

Anson	8	15 10 15 8

* Shot for targets only.

The above scores will show that Gray was high gun for this day in the regular programme events with 163 scored out of 175, with Squier second with 161 out of 175, and closely followed by Apperson and Rike with 159, Ruble and Partington 158, and Frank Alkire 157.

Second Day, May 3.

The second day of the third annual tournament of the Peru Gun Club, which was on May 3, was not a record-breaker in point of attendance, but it will go down in history of trap-shooting as the day upon which a squad of shooters at the score broke a world's record by scoring 100 targets in a 20-bird race, which was the first time that the feat of making a clean score was ever accomplished by any squad in a race of any length. What was the more remarkable about this score was the fact that it was accomplished by a squad of gentlemen who are amateurs pure and simple, and do not follow the sport of trap-shooting as a profession in the slightest degree. This squad was composed of Dr. O. F. Britton, of Indianapolis, Ind.; F. D. Alkire, Woodlyn, O.; Ed Rike, Dayton, O.; J. L. Head, Peru, Ind.; and H. W. Cadwallader, Danville, Ill., at the score in the order named. Further mention of this feat will be found in the notes of this tournament. The weather of the first day continued upon the second, and while the attendance was smaller some new faces appeared in the persons of Dr. Senieur, of Troy, O., and Messrs. Walter Hartman and Bert Robbins, of Auburn, Ind. The following are the scores for the second day:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Birds:	15	20	15	20	15	20	15	20	15	20	15	20

* Denotes shot for targets only.

The averages for those shooting through the entire programme of 385 targets for the two days were as follows: Squier, 364, .951; Rike, 361, .938; Snow, 357, .927; Alkire, 354, .919; Partington, 353, .917; Ruble, 351, .911; Gray, 347, .902; Parry, 342, .888; Cadwallader, 335, .871; Cavanaugh, 333, .864; Tripp, 309, .802.

Mr. E. E. Neal's average was not computed, as he withdrew from the sixth event after six or eight targets.

Squad No. 1 the second day did some truly remarkable and regular shooting, as in event No. 2 they each scored 19, and in event No. 8 they broke all previous records by scoring 100 targets straight in a 20-bird race. This occurred at about 12:30 P. M., and it did not occur to any member of the squad that they were going to break the world's record. In fact, the programme was being hurried through in order to allow the most of the shooters to leave on the 3:25 P. M. train for Indianapolis. However, when the 16th round had been reached and 80 targets had been literally ground into dust, a settling down of the squad was easily noticed, and one or two members who are inclined to talk when shooting, were noticed to be doing nothing but shoot. No one said a word, but some one in the crowd of spectators and shooters whose attention had been attracted to the remarkable exhibition being given by this squad spread the news around that there was something about to happen over at the magatrap. The shooters left the other set of traps, the spectators crowded closer, and while no one addressed a word to the shooters at the score, the excitement was intense. As Dr. Britton, the veteran of many exciting matches closed with a clean score and turned to go to the club house, there was a slight inclination upon the part of some of the spectators to cheer, but a quiet "hush" from the watching shooters silenced all applause, and Frank Alkire smashed a left-quarterer into dust. Old Reliable Ed Rike, as steady as a clock, drew a high right-quarterer and blew it out of sight. Gray, of the home club, who had led the crowd the first day, but had not yet scored a straight on the second, and who was at No. 3 position, drew a straightaway from the trap, but slightly right-quartering to him, and smothered it before it had gone 20ft. from the magatrap. It was now up to Cad. Here was a gentleman who is one of the best amateurs in the State of Illinois, but he had not as yet scored a straight in this tournament. Yet he was as cool as the proverbial cucumber, but when his bird broke in the trap the crowd wondered: Will he lose his nerve? Not for the world. Cad only steadied himself a little, his firm call "Pull!" came without a tremor, and when a sharp left-quarterer from the trap, but nearly a straightaway to him, left the trap, he blew it out of sight, and the world's record was broken. The shooters and few spectators cheered the squad to the echo, but no one man ever showed better nerve than Mr. H. W. Cadwallader, of Danville, Ill., when he broke his first straight in the eighth event of the second day and helped his squad to be the first to make the record so long sought by the trap-shooters of the universe.

LOUIS D. REAM, Acting Sec'y.

Trap at Watson's Park.

The following events were shot recently at Watson's Park, Burnside Crossing, Ill.:

Alpine Gun Club.

May 4.—In the 25-bird race of the Alpine Gun Club Barto won with the excellent score of 22, and also with a score of 23 in the target race for the medal he won on 23. Montgomery Ward & Co. Trophy Shoot.

May 5.—The sixth contest of the Montgomery Ward & Co. trophy resulted in a tie between Dr. Shaw, H. O. Stone, J. R. Magill, W. B. Leffingwell, A. W. Adams, Hollister, J. S. Boa, D. O'Brien and J. T. Dazey. Mr. W. B. Leffingwell won medal No. 1 and Dr. Shaw won medal No. 2 by making the longest run of kills from the start, 13 in all. Palmer won out on ties on 14. E. Steck won out on ties on 13.

In a match at 50 targets on this day Steck and Boa tied on 43. The scores: J L White, 30, *1. 1111021111110211—14 O E Searles, 30, 3. 02222200222202211—14 Dr Shaw, 30, 1. 1212222211111012—15 H O Stone, 28, 3. 102022121022222212—15 J R Magill, 28, 3. 222102212111201012—13 J Elias, 29, 2. 0121112220221001—13 W B Leffingwell, 30, 3. 011021211122112—15 P Adams, 30, 2. 22000221001000w A W Adams, 28, 3. 1211*0221210221012—15 Hollister, 30, 2. 1212210111011111—15 S Palmer, 29, 1. 0112102112111122—14 J S Boa, 29, 2. 222022222122222—15 G Roll, 30, 1. 0220220202112221—12 Geo Thorne, 28, 3. 210012201121110020—12 Dr Miller, 30, 2. 12102101122021212—14 D Bacci, 28, 3. 22022010020222101—12 E P Dewolf, 28, 3. 00220011110111010—11 J H Amberg, 30, 2. 12112221202111001—14 H Levi, 29, 4. 222200121022110011—14 R Simonetti, 29, 3. 12120221000112102—13 J B Barto, 30, 1. 2210022120201211—12 E Steck, 30, 1. 0101222222120121—13 D O'Brien, 29, 1. 2012221121212122—15 J T Dazey, 28, 3. 1221111011111111—15

WESTERN TRAPS.

Montgomery Ward & Co. Diamond Badge.

CHICAGO, Ill., May 6.—Yesterday at Watson's was a merry day and a lovely one, the gilt-edged May weather being all that could be asked and a lot more than should be expected in Chicago. The interest in this series of contests continues unabated, which is proof enough that the running of the shoots is of such nature that the sportsmen of Chicago like to come out and take a hand in them. There were twenty-four good men and true yesterday who mixed it up lively for the finish in the event, and this time manager Leffingwell himself was the lucky one, and landed the badge, Dr. Shaw winning the high average medal for consecutive kills. Silas Palmer, who is getting to be about as dangerous an amateur as we can scare up here, won the 14 tie, and Eddie Steck the 13 tie. Scores follow from Mr. Watson. This prosperous trophy race will end in August, and this is matter of regret, for the firm has stated that it will not then further continue these badge shoots. We need some good clean competition here all the time to keep interest alive.

On Tuesday evening, May 4, in the State street hall, there took place the disbandment of the Cook County Trap-Shooters' League. Eureka, Garden City and Calumet Heights clubs sent representatives. Too many strings, I presume.

Next week comes the old-time Illinois State shoot, for the second time at Peoria. Chicago will not send any very heavy delegation, but enough to show that the fixture is her favorite one. The representation from below will be large, and a cheerful and enthusiastic time may be promised in advance. The Peorians are big-hearted fellows and splendid entertainers. At this writing it seems likely that the shoot will go to Peoria next year, but no extended look at the slates has been had as yet.

We will send a little group of Illinois shooters down to St. Louis for the Missouri State shoot, May 15-20. John Watson is scheduled, but that is a good way from home for John except in the jack snipe season.

Mr. Will K. Park, of Sporting Life, Philadelphia, is in town to-day on his way to Ottawa and Peoria next week, and will take in some of the bigger Western shoots this coming month.

For a long time the Knoxville squad record, 119 out of 120, has remained unbroken, and seemed about as much as could be asked from five different men shooting at 20 targets, each in the same event, shoulder to shoulder. Yet on Tuesday of this week, May 4, this record was twice broken, and a perfect squad score of 100 made. This happened at two Western points, widely separated. At Lincoln, Neb., in the State shoot, squad No. 1, composed of A. B. Daniels, of Denver, Colo.; George Rogers, Lincoln; W. S. Duer, Hastings, Neb.; C. A. Young, Springfield, O.; and Frank Parmelee, Omaha, Neb., went from the score with a clean balance sheet, the five men having each broken his 20 straight without a skip or a hitch. In this squad, singularly enough, was Charlie Young, who was one of the five who broke 119 in the earlier record. This performance must have given the boys who took a hand in it a lot of comfort, and it seems almost too bad to think how short-lived was their glory. Yet on the same day, at the third annual tournament of Peru, Ind., the feat was duplicated. Dr. O. F. Britton, of Indianapolis; F. D. Alkire, Woodlyn, O.; Ed Rike, of Dayton, O.; H. W. Cadwallader, Danville, Ill., and J. L. Head, Peru, Ind., constituted the squad in this instance, and I have no doubt that they felt just exactly the way their friends and acquaintances were feeling at the same time out in Lincoln, this being a case of five of the one, and one less than a half dozen of the other. I have not any records available at this moment, and memory does not serve, but I have a vague idea that Ed Rike figured in that 119 score. If so, he and Charlie Young may very well

Nebraska State Tournament.

LINCOLN, Neb., May 5.—The twenty-third annual meeting of the Nebraska State Sportsmen's Association and tournament was graced with a fair attendance and favorable weather; so, with these two essential features, it must be classed as a success. True, the attendance was not up to what the promoters of the tournament had expected, but it is well to remember that only two weeks previous another tournament had been held at Lincoln and in face of this it is all the more remarkable that the attendance was so good, and was maintained up to so uniform a standard throughout the four days. While the number of principals engaged on the first day was less than on any other, this is really the case at a tournament, as the first day generally records the big entry at nearly all shoots. This can be directly attributed to the manner in which the programme was arranged for the setting aside of six events each day for the rank and file naturally appealed to this element, whose wishes must hereafter be consulted, in order to insure the success of any tournament. While these events were mostly short races, as they should be, the management should have gone further and divided the purses in these events at least by the Rose system, in place of that rancorous old inequitable system; for then those who performed the most meritoriously would have received their just compensation, and not the most fortunate ones.

The programme makes reference to that old, rank coward, "no dropping" for place, and calls attention that this is prohibited by the constitution of the Association. Of course, this is a bluff, for where the above system is in vogue no mention should be made of dropping for place, for the system is of itself responsible for this incident, as it frequently places a premium on inferior shooting. A very forcible illustration of this occurred during this tournament. In one of the 15-target events there were no straights, but ten scored 14, eight 13, six 12 and four 11, while there was no 10, nor 9, and but one 8, which received fifth money, \$4.30, and none of the other places paid entrance money. Such conditions I maintain should not be permitted to exist.

Shooting Grounds.

The tournament was held on the grounds of the Capital Gun Club, one of the best-arranged shooting grounds in the West. The appointments were very complete. The club has three sets of target traps arranged on the Sergeant system, and one set of five-bird traps. The former are so located as to permit the use of both at the same time. At the target traps the shooter, when at the score, faces north, while when shooting pigeons, he faces a little east of north. This obviates any interference by the sun, and also insures a good light, which every shooter understands is quite essential in making good scores. The club house is rather small, especially for occasions like this, though it will answer very well for club shoots. However, there was no lack of shelter for the shooters; for the club had taken the precaution to provide a very large tent for the accommodation of its guests, one amply large enough for an hundred people. I am told that the club contemplates erecting a nice house on the ground shortly. Another very nice arrangement was that which prevented the spectators from encroaching on the shooters while at the score. The seats for them were so located that they could not come in contact with the shooters at all, being separated by a woven wire fence, though it was possible for them to obtain a good view of the shooting from where they were situated. On live-bird day there was quite a crowd in attendance to witness the sport. Unfortunately Mr. R. M. Welch, the secretary of the club, was called to Cincinnati on business just prior to the tournament, so that all the work of conducting the affair devolved upon the shoulders of Mr. George Rogers and H. H. Harley, both of whom are very consistent workers and were about early and late to see that everything the schedule called for was carried out to the letter. George Rogers shot through the entire programme, and his shooting, despite the handicap, was of a very high character, and excellence, he being near the top each day, and also among the first in general averages.

The club leases the ground, about five acres, and has it all inclosed in a 6ft. woven wire fence. The electric cars run right to the gate, it being only 15 minutes' ride from the heart of the city.

In the cashier's office Mr. F. E. Mockett held sway, and the gentleman was highly qualified to fill this arduous position, being both courteous and capable. His work was done with a dispatch that was gratifying to management and principals alike. Mr. Fred Karcher, one of the referees, is quite a character himself, and added much to the pleasure and enjoyment of the visiting shooters by his musical ability and originality. Every night the shooters would gather in room 113 at the Lindell Hotel and here Mr. Karcher, and Roll Heikes would entertain the shooters with rare selections, rendered on the banjo and mandolin. This entertainment never lacked spectators, for not only were the shooters in evidence, but quite a number of the other guests of the hotel would drop in to enjoy the rendition. Mr. Karcher is proud of the distinction of being the referee on the occasion when the new squad record was made.

That New Squad Record.

This new record was made with a curious and singular combination, and it may be of interest to know what guns and loads were used by the principals. Rogers, No. 1, shot a Greener gun, Leader shells and Austin powder; Daniels, No. 2, shot a Francotte gun, Smokeless shells and Du Pont powder; Duer, No. 3, shot a Parker gun, Smokeless shells and Du Pont powder; Young, No. 4, shot a Smith gun, Smokeless shells and Du Pont powder; Parmelee shot a Remington gun, Smokeless shells and Schultze powder. Thus, it will be seen, that the principals used each a different gun, and two kinds of shells and three kinds of powder were represented. But this is not all, for, though to add to the singularity of the combination, two kinds of targets were used.

Out of Town Principals.

These consisted of W. E. Beeson, Grand Rapids, Mich.; W. D. Townsend, W. D. Burgess, G. F. Brucker, Plumber Reed, Frank Parmelee and Kimball, Omaha; Louis Painter, Osceola, Ia.; Ed L. Clark, Nora Springs, Ia.; Howard Davidson and Henry Thiel, Junction City, Kan.; E. R. Eway, Chadron, Neb.; R. R. Kimball, Fremont, Neb.; Dr. J. B. Hungate, Weeping Water, Neb.; W. S. Duer, Hastings, Neb.; C. D. Hagerman, Wymore, Neb.; Chas. Young, Springfield, O.; A. B. Daniels, Denver, Col.; E. E. Hairgrove, Sutton, Neb.; O. F. Harlan, Cook, Neb.; F. M. Eaton, Geneva, Neb.; C. J. Brook, Atkinson, Neb.; M. T. Miller, York, Neb.; W. J. Organ and J. G. Hilbery, Beaver Crossing, Neb.; Geo. Peterson, Coon Rapids, Ia.; C. D. Linderman, Adams, Neb.; Dan Bray, Syracuse, Neb.; Geo. Nicolai, Minden, Neb.; D. C. Olmstead, Bertrand, Neb.; Geo. Schroeder, Columbus, Neb.; J. W. Den and Chas. Atkinson (Brink), Arapahoe, Neb.; Bert Long, Mason City, Ia.; F. Miller, Berwyn, Neb.; G. O. Rains, Beatrice, Neb.; J. F. Berard, Herman, Neb.; W. H. Hen, Concordia, Kan.

The trade was represented by R. O. Heikes and Jno. J. Hallowell, of the U. M. C. Co.; Fred Gilbert, Du Pont Powder Co.; Chas. Budd, Hazard Powder Co. and Parker gun; J. C. Fanning, Gold Dust Powder Co.

Association Session.

The annual meeting was held Thursday night at the Lindell Hotel, and was a very brief session, only routine business being transacted. This consisted in calling the roll, collection of dues and the selection of a place for holding the next tournament and the election of officers. The Omaha Gun Club and the Lincoln Gun Club, of Lincoln, were bidders for the tournament. When the names of the two clubs were submitted to a vote the result was that Omaha was chosen on the first ballot, the vote standing Omaha ten and Lincoln eight. W. H. S. Hughes, Omaha, was elected President, and E. E. Hairgroves, of Sutton, was chosen Vice-President; Geo. W. Loomis was elected Secretary and Treasurer.

First Day, Tuesday, May 2.

For some time Pop Heikes has been up in the air, so to express it, in regard to a gun that would fit him. However, by the stride he had to-day one would infer that he had found one that did fit him in the Parker he used. The conditions of the shooting were of the hardest nature, as the velocity of the wind was something awful, and I cannot recall a single instance where it ever blew so hard for so long a time. It began early in the morning, and continued until night. The destruction of the club house and tents were momentarily expected, as the former swayed to and fro, and the beams and rafters in the latter quaked in the most awe-inspiring manner. Meanwhile Roll was complacently and imperturbably negotiating the targets to such an extent that but few ciphers were recorded against him, and these few were dotted along here and there. His total for the day showed but ten losses, and his average was .944. True, he and others have often exceeded

this, but I question if such shooting was ever done in the face of such a wind.

Charley Young also shot well, for he is second, with an average of .933, two breaks short of Heikes' total. In the five 15-target events he lost only one, but he was not so successful in the longer events. As he is shooting in the amateur class, thereby being permitted to contest for the money in all the events, he is the biggest winner of the day, for two of his straights occurred when there were no others. George Rogers, one of the local contingent, is third, with a percentage of .916. Event No. 5 was a 25-target race, in which there was a special prize in the shape of a silver cup. This Rogers won on a score of 24, for, though Budd and Heikes tied him, they could not compete for it, as this event was open to amateurs only. Heikes missed his last bird in this race. Rogers was a good winner on the day's shooting, as his 20 straight in event 2 was the only one, and netted him \$17.75. Hallowell also counted good and hard once, his being the only straight in No. 4. Duer arrived late, but showed up well in the events he took part in.

Second Day, Wednesday, May 3.

The general improvement in the scores of to-day may be attributed to the favorable weather conditions. In this respect nothing could be asked for except that it was a trifle too cold, but the wind that blew did not affect the flight of the targets materially, and notwithstanding that it was hazy most of the day the light was good.

Roll Heikes went the entire route with loss of but 7 targets, and in face of these returns it but follows that he is again in the van with a percentage of .948. While this is a trifle better than yesterday, I do not consider it as good an exhibition of shooting. The other Ohioan, Charley Young, is again second with .942, having dropped but 10, 5 of them in the 50-bird event. However, he was not so fortunate to-day, as he had a number of opportunities to win good money in the 15-bird sweep by going straight, and only once did he succeed. This was the first event. In the three other events of this kind he scored 14, losing his 13th target in one, his 14th in another, and finally his last one.

Gilbert and Fanning came to the front to-day and occupy third and fourth places in the order named. Daniels is the only one in the simon-pure class to make a percentage of .900, though Painter and Rogers are but a single break short of this.

Fanning and Daniels are the fortunate ones, as each broke a 20 straight at an opportune time, which paid \$17.75. There was only one 15 straight in all of the four amateur events, and Young got this.

No long runs were made, Heikes' best, 58 and 59, while none of the other contestants could group their break together to any extent.

Event No. 8 in the table is the Parker gun handicap. This was really event 3, but for convenience sake I have placed it last. Thus to be able to show the total each contestant made, as well as the bird allowance, he had and the number he scored of these. For the handicap did not consist of added targets, but an allowance, and the number he was able to score of these was then added to his total. Thus Moore, the winner of the gun, broke 45 out of 50, and had an allowance of 6, of which number he broke 5, making his total 50. The figures in the ninth column of the table show the allowance each shooter had, and those in the last column show the number he actually broke of these. Some who had no show to get into the money did not shoot their allowance, so this is not given. There were five moneys in addition to the gun, first going to Hagerman and Linderman, who, with their handicap, scored 47; 46s were numerous, while there were three 45s and two 44s. Hungate was the only 43, and this paid better than any place but first. Heikes made the top score in this event, scoring 48, losing his first and sixth targets. The four 20-bird events were open to all, the others to amateurs only.

Events:	1	2	3	4	5	6	7	8	9	10	Shot

State Live Bird Championship.

The closing event of the tournament was the contest at live birds for the State championship, the C. E. Mayne diamond badge being the emblem at issue. This contest consisted of 15 live birds, \$15 entrance and \$15 added, four moneys, 40, 30, 20 and 10.

Fifteen shooters qualified for the race, and at the finish it was found that Dan Bray, of Syracuse, and Geo. Nicolai, of Sutton, had accounted for their total. The shoot-off was at 5 birds, and the first 5 resulted in another tie, but in the next a decision was reached, as Nicolai drew a left-quartering outgoer in the 7th round that he could not negotiate. Bray again accounted for his 5, and thereby won the trophy on a score of 25 straight. Smead, of Omaha, won the badge last year, but failed to materialize for this contest. Moore, of Lincoln, was the only one to score 14, and this gave him a nice little roll. Another noteworthy feature was the poor showing of Frank Parmelee, who only scored 11, which is the poorest score that he has ever made in a contest for this badge. However, in justice to him it must be stated that he was without a pigeon gun, and used three different ones during the day. The weather was cloudy, though pleasant, while in the afternoon a good wind prevailed.

PAUL R. LITZKE.

Jeannette Gun Club.

ELTINGVILLE, S. I., May 3.—Goodly numbers of the Jeannette Gun Club and the Columbia Fishing Club were present on the charming grounds of the latter organization to contest for the special prizes in a live-bird shoot, to-day. The mere mention of these grounds conveys no adequate idea of their elaborate equipment and natural beauty. Situated on the east coast of Staten Island, they have an area of eight acres, on which are a well-built club house, a large boat house containing several fine launches, large and small a large dormitory, a club building for the shooters, stables, a poultry yard, garden, etc.,—all most complete in themselves and their appointments. The shooting grounds slope gently toward the shore, and are next to it, so that on one side is the surf-beaten shore and broad ocean open to the view, while on the other side were fruit trees in full blossom, forming a setting than which nothing more beautiful could be desired. In this beautiful club resort, the club members spend many days with their wives and children in wholesome and sensible enjoyment.

The shooting was enjoyed with a zest which was thorough. The prize in the 7-bird event was a silver cup, made by Tiffany, intrinsically valuable in itself, but prized much more by the competitors as a desirable trophy. Good shots and difficult kills were applauded to the echo. The traps were set on the slope next the shore, highest on the right as one faced them. The grass, grown already to a height which largely concealed birds which preferred to walk rather than fly, was of the deep green of the springtime. A powerful wind blew across from left to right as one faced the traps.

The retrieving was done by the Jeannette Club's setter dog, a most indefatigable worker, far above the average retriever in promptness and finish of performance, and very intelligent withal. The office of referee was filled most satisfactorily by Mr. H. P. Fessenden, while that of scorer was filled by the painstaking popular Johnnie Jones.

The first event was at 7 birds, handicap rise, Interstate Association rules. The scores:

Rottman, 28	220222-5	J Bohling, Jr., 25	2222222-7
Debacker, 28	1101010-4	L H Schortemeier, 33	2022222-6
Ehlen, 25	2002222-5	H Lohden, 25	120110-5
Brunnie, 28	21101*1-5	J H Kroger, 28	1121202-6
Barr, 25	2200010-3	Ringhoff, 28	0011111-5
Steffens, 32	2121210-6	F C Karstens, 28	0221201-5
Pape, 28	1021111-6	G Meyer, 25	0121112-6
Nobel, 25	0220221-5	J Wellbrock, 28	100010-2
J Mohrman, 25	2220122-6	Keilshorn, 27	120**1-3
Kid Peters, 25	2012202-5	Ferguson, 25	020*210-3
Hainhorst, 28	210*202-4	J Vagts, 28	0120011-4
J Bohling, Sr, 30	101112*-5	C Meyer, 25	0*110*1-3
Otto, 28	1122101-6	J Mehnke, 25	01202*2-4
Schlicht, 28	1122112-7	J D Wilkens, 25	0210110-4
Garms, 28	22*2000-3	C Bralng, 25	1001020-3
Leoble, 28	2222222-7	W Ralphs, 28	2202100-4
C Von Lengerke, 30	2222020-5		

Leoble and Bohling, Jr., were the only two who killed straight. In the shoot-off the latter missed his first bird, while Leoble killed his, and won the cup. Leoble was shooting in fine form, delivering both barrels in quick time and admirable accuracy.

The second event was miss-and-out. After the first round or two the struggle narrowed down to seven out of the thirty-two shooters, Barr, Steffens, Hainhorst, Garms, Leoble, Wellbrock, Schortemeier and Meyer. Barr and Leoble missed their 9th and went out. Schortemeier caught a hot twisting right-quartering driver, which got away in the 11th round, as it sped swiftly before the wind. Meyer missed his 12th. Steffens drew an easy one and killed it, and won in the 12th round. The prize was a beautiful toilet set, hand painted. Capt. Robert Debecker had the painting done to order, and the artist's work alone cost \$50.

The Bedford Rod and Gun Club, Bedford, Ind., holds its third annual tournament on Friday of this week. There are eleven events on the programme, five at 15 targets, \$1.50 entrance; five at 20, \$2 entrance, and one at 25 targets, \$3 entrance. F. T. Sherwood, Sec'y.

St. Louis Shooting Association.

St. Louis, April 4.—At a meeting of the board of directors of the St. Louis Shooting Association, held at their headquarters, in room 34, Insurance Building, Friday, the handicap committee that will grade the participants in the live-bird events, which will be held at the big May tournament, at Du Pont Park, was selected. The committee will be composed of the following well-known sportsmen: Thomas Marshall, John Watson, Will K. Fox and G. M. Walden. The fifth member, who will be a St. Louisan, was not definitely decided upon, but in all probability Edward Prendergast will be selected to look after the interests of the Mound City shooters.

Prendergast, although a young man, has been before the sportsmen in this city for a number of years. He has competed with almost every expert shot in the country, and was at one time champion of Missouri. Prendergast probably knows more individual shooters in St. Louis and vicinity than any other man, and consequently a more capable man could not be selected to serve on the handicapping committee. Thomas Marshall is Mayor of Keithsburg, Ill., and is a two-time winner of the Grand American Handicap. No shooter is more widely known than Marshall, and he is thoroughly competent to judge of the respective merits of the participants in the live-bird handicaps.

John Watson is a resident of Chicago, and is the owner of the famous Burnside Shooting Park. Watson has probably trapped more birds and watched a greater number of sportsmen at the traps than any other man living.

Will K. Fox is well known in the trap-shot circles of the East, and will take care of the Eastern sportsmen in the handicaps.

G. M. Walden is a resident of Kansas City, and he will look after the West. Walden was president of the Missouri State Game and Fish Protective Association for two years, and is thoroughly conversant with tournament affairs. He knows how disagreeable is the duty of a handicapping committee, and only accepts the position as do the other gentlemen, with a spirit of sacrifice, with the view of fostering the great sport.

E. S. Rice, of Chicago, who took a party of over 100 sportsmen to the big Elkwood Park shoot last month, will head a large delegation from Chicago to the St. Louis shoot. Rice is especially interested in the big event of the week, the Du Pont championship contest, which will be decided on Friday, May 10. In view of the value of this trophy and the number of times it has been defended, a vast amount of interest is being taken in the probable outcome of this event. In this contest there will be entered every crack shot in the United States, and every amateur who thinks he has a chance to kill 22 out of 25 birds.

Picking the winner of this event will be a decidedly difficult matter, as the handicapping committee will do its work so thoroughly that the 100 or more competitors will be placed on an absolutely fair and even basis. This will also be true of the contest for the valuable trophy offered by the St. Louis Republic and the Lemp medal. The handicapping committee will see to it that these events will furnish close and interesting sport.

In target events there will be no handicaps. Every shooter shoots at the same number of targets from the same score. These targets at Du Pont Park are apparently very difficult. This arises from the fact that the target traps are sunk in the ground, and the absence of a screen gives the shooter a view of the target much quicker than when a 3ft. screen obstructed the view. The shooter seeing the target 20ft. nearer than usual does not make the proper allowance for the speed of the target and shoots behind it. He realizes after the first event is finished that he has much more time to break the target than under the old system, and therefore is more careful in his aim. High averages are sure to prevail at the May tournament.

Ample facilities for taking care of the crowd at Du Pont Park have been made. The old Du Pont magazine, which is a brick building 40 x 60ft., will provide ample storage for guns and shells during the tournament week. Watchmen will sleep in the building every night. A cashier's house and shoot pavilion have been erected near the live-bird grounds. A large oblong tent, 40 x 60ft., will be placed immediately behind the target rangers. Another tent of the same size will be used for a mess room. In the rear of this there will be a tent for the kitchen. These tents, with their white surfaces, will make Du Pont Park look like a circus grounds during the week. The number of inquiries for programmes from almost every State in the Union indicates the largest attendance that has ever been at a Western tournament.

Considerable rivalry exists between St. Louis and Kansas City as to the number of teams that will represent each city in the team shoot for the State medal. Herbert Taylor, of the St. Louis Shooting Association, returned from Kansas City last Wednesday, and he stated that arrangements had been made by the shooting enthusiasts of the western Missouri metropolis to secure a private car that will bring thirty Kansas City shooters to the May shoot.

There will be five teams from Kansas City, consisting of the O. K. Gun Club, Stock Yards Gun Club, Washington Park Gun Club, Belt Line Gun Club and Kansas City Gun Club. The team that will represent the last-named club will include such wonderful shooters as Christ. Gottlieb, Champion Jim Elliott and J. E. Riley. The latter is training hard for the shoot. He is particularly anxious to win his match with Rolla Heikes, which will take place at Du Pont Park on Saturday, May 13, two days before the commencement of the big tournament. Elliott is at Hot Springs, and according to reports he puts in about five hours a day at hard work, and will be in fine fettle when the shoot commences.

Five and possibly six teams will represent St. Louis in the team shoot. The team composed of Dr. J. W. Smith, Dr. Max C. Starkloff, Edward Prendergast and Peter M. Kling, which now holds the medal, will in all probability be the favorite for the shoot. Kling is at present in Berlin, Germany, and if he does not return in time to participate in the match, J. J. Sumpter will probably take his place. The St. Louis Gun Club team will be composed of H. B. Collins, F. W. Paramore, C. W. Scudder and Charles McClure Clark. Another team will be from the Du Pont Park Gun Club which will be composed of J. M. Selzer, J. H. Conrades, Jr., Charles Spencer and Herbert Taylor.

John and Duthiel Cabanne are organizing a team that will prove a mighty tough proposition. Capt. Will Lenzard is selecting a team to represent the Central Gun Club. Capt. Stroth of the Riverside Gun Club is picking a team that the Riversides say will beat the West End Gun Club in the race for the medal. It is now thought that at least eighteen teams will meet in the contest for the State medal.

GEORGE MUNSON.

Haverhill Gun Club.

HAVERHILL, Mass., April 29.—A few members of the Haverhill Gun Club participated in a little practice this afternoon, with Mr. J. R. Hull, one of Parker Bros.' traveling representatives, as a visitor.

No regular programme was shot, just a "ragtime" shoot, which was thoroughly enjoyed by all. The remaining ties from our Patriots' Day handicap for third prize, consisting of a split-bamboo rod, was decided, between Tuck and Bradford, the former winning on the first round.

We are now preparing ourselves to hear about the "biggest one that got away, took my hook, leaders," etc., and other fish stories. Mr. Hull was shooting a gun new to us, and the work he did with it will show in the score. He allowed no time to be wasted, as between whiles he made up a squad consisting of Hull and "himself" and kept blazing away.

Events 1, 2, 5, 12 and 13, unknown angles; events 7, 8, 9, 10 and 11, regular angles; events 6 and 7, reversed angles; event 3, expert, one man up. Scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13
Targets:	10	15	10	15	10	15	10	15	10	15	10	15	25
Hull	8	9	14	7	13	5	10	14	13	14	8	24	23
Brown	6	10	6	5	10	5
Tozies	6	6	10	4	13
Miller	9	7	10	5	10	4
Lambert	13	9	14	8	7
Bradford	9	6	12	7	5
Tuck	9	8	13	3	8

In one of Hull's "lone events" he made 29 out of 30, with 28 straight.

C. F. LAMBERT, Sec'y.

John F. Weiler Gun Club.

ALLENTOWN, Pa., May 3.—The scores made at the club's monthly shoot, at Duck Farm Hotel were as follows, Charles Kramlich winning the medal:

Event No. 1, 25 targets: J. Rehrg 16, O. Griesemer 14, Erdman 12, George Kern 10, Joe Flickinger 7, Charles Kramlich 18, O. Acker 16.

Event No. 2, 8 live birds: John F. Weiler 5, O. Griesemer 4, George Kern 4, O. Acker 5, Joe Flickinger 6, J. Rehrg 6, Thomas Crader 6, Charles Kramlich 8, O. J. Engleman 7.

C. F. KRAMLICH, Fin. Sec'y.

Boston Gun Club.

WELLINGTON, Mass., May 3.—The magauart furnished amusement and practice for fifteen shooters Wednesday afternoon at Wellington on Boston Gun Club grounds. Some good scores were made, though it was considered a very windy day by some who stayed at home, unwilling to risk their reputations as experts. These are the people who miss the very elixir of trap-shooting, the spice of the cake, as it were, the real practise where the targets are not mere inanimate saucers, but flying objects, temporarily imbued with life to deceive and mislead the unsuspecting sportsmen. A 70 per cent. average under such circumstances is worth to the shooter more than an 80 or 85 on easier days, and small loss if the scores fail to impress one's friends in becoming style when beneficial training of eye and hand is gained in the contest between erratic flights and steady shooter.

To-day regardless of wind and a comparatively novel trap system some really fine scores were made in the match. Mr. Thos. Howe, of the Hingham Club, at 17yds., broke 61 out of 70 targets, all kinds, and Leroy, who was but one target behind at 21yds. rise, later on broke 24 straight at 16yds. So this particular trap continues suiting some Eastern as well as Western shooters.

Aspirants for straight honors were Messrs. Howe and Leroy, two each; Sheffield, Spencer, Hull Gordon and Hood, one each. Scores in full.

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13
Targets:	10	10	5p	10	10	10	10	10	5p	10	10	10	6
Gordon, 17	6	5	5	7	5	8	5	10	9	5	7	8	3
Miskay, 18	9	7	5	8	7	7	8	9	8	7	8
Leroy, 21	9	9	8	9	8	8
Hull, 21	6	9	5	9	6	6
Woodruff, 17	9	7	8	7	8	9	8	8	6
Allison, 18	9	9	8	6	7	6	7
Nickols	8	8	2	3
Howe	10	9	7	7	10	9
Sheffield 16	10	4	6	8	7	3	9	6	5	8	6	7	3
Hood, 18	6	8	4
Goodhue, 16	3	5	5	2	3	3	6	8	7	5	7	6	3
Tozier, 16	5	4
Spencer, 18	8	8	9	1	8	6
Dana, 16	6	7	6
Michaels, 16

All events unknown angles, except No. 9, at known; 3 and 10 at pairs:

Fourth shoot in prize series, 30 targets, unknown angles:	
Spencer, 18	10111111011 10111 1111 111111-27
Hood, 18	111011110110111111111111-27

Fort Smith Gun Club.

FORT SMITH, Ark., May 1.—The opening shoot of the Fort Smith Gun Club took place at the Fair grounds, Saturday evening. As it was the last of the month the attendance was small, most of the members being busy with their books and accounts.

A strong wind was blowing across the traps, and the birds were thrown hard. This, together with the fact that the shooters were somewhat rusty, kept the scores low. Mrs. Ben Atkinson favored the club with her presence, but her shooting was badly handicapped by a faulty gun. As it was, she beat Webber out on the first 10 birds.

Baptiste and Leach shot a race against Matthews and George, 40 birds to the team, the former winning by a score of 39 to 19.

Leach shot Baptiste a race for the price of the birds, the former winning by a score of 40 to 29.

There were not enough present to effect a reorganization, which will probably be accomplished at the next regular shoot, which takes place on next Saturday evening, at 4 o'clock.

Chief Fuller was present and fired a few shots just to get his hand in, but as he did not fire 25 shots his score is not given, it being necessary to fire that amount to get an average. Following is the score:

Shot			Shot		
	at.	Broke. Av.		at.	Broke. Av.
Leach	52	42 .810	George	50	25 .500
Matthews	50	32 .640	Webber	25	6 .240
Baptiste	50	29 .580	Mrs Atkinson..	22	3 .120

ABOUT SCHWEITZERKASE.

If you have no case, abuse the plaintiff's attorney; if you are put to it for an argument, call names, the hardest names you can think of. This is the good old rule which has been followed for thousands of years and will be kept up so long as human nature shall remain what it is. But to call names, though cheap, convinces nobody. Though one were a past-master in blackguardism, like Dennis Kearney, of Sandlots notoriety, who once dubbed an opponent a slab-sided, bung-eyed hyena; or like the prophet who from behind the barricades of game he has slaughtered "just for pastime" shrieks "game hog" at his fellows, his hard names would carry no persuasion nor reformation, nor conviction, nor accomplish anything else than to reveal the weakness of his own position.

A case in point is that of the net fishermen of the vicinity of New York and the amateur anglers who have banded themselves together in a Protective League of Salt Water Fishermen. The purpose of the league is to secure the enforcement of the laws relating to netting and the pollution of the waters by waste from factories and other sources. The organization has already gained formidable strength, and those who are back of it have demonstrated that they "mean business." They are alert to the situation, and have begun a campaign which they promise to keep up until they shall have achieved its purpose. Naturally, they have excited opposition, and the opposition has taken the form of ridicule and derision. The netters' advocates call their opponents names. They say that they are schweitzerkase fishermen. The implication is that the League people are of a humble class, whose rights are not worth while respecting, and that their interests are of no importance as compared with those of the netters.

There may be honest differences of opinion respecting schweitzerkase. Some people like it, others do not; it is a matter of taste and of good digestion. The cheese is an important article of diet; tons of it are consumed annually on Manhattan Island; but we have never heard before that its consumption had any bearing upon the moral, social, industrial, political or sportsmanlike standing of those who eat it. No one is any better or worse for the eating of schweitzerkase; no more nor any the less respectable. Nor are his angling interests to be influenced in the slightest degree by the fact that he does or does not take schweitzerkase along with him on his fishing trips for lunch. Many worse things go into the lunch baskets of more pretentious folks. Nor is there any good reason why the interest of the schweitzerkase fisherman should not be protected equally with that of those anglers whose elaborate lunches comprise all the high-priced delicacies of the season and the most expensive wines. The man with the schweitzerkase gets just as much enjoyment out of his fishing, and is fully as deserving of consideration and has precisely as much claim to the protection of the law for preserving to him the opportunities to enjoy himself in his own way. This is a fact which cannot be covered up by calling names.

Now what are the facts of the case affecting the great class of salt water fishermen whom the city pours out annually to the banks of the Hudson and the East River, to the shores and bays of Staten Island, Jamaica Bay and neighboring waters, and up the Sound? Ninety-nine out of one hundred of them are working men, engaged during all the rest of the week in toil, and intent in the short hours available for recreation upon having their favorite sport in their own way. The League president, Mr. Biedinger, a letter carrier, will stand as an example of its membership. They are not those who can spend money without thought for railroad fares to distant waters, and afford the time and expense of putting up at summer hotels or staying at expensively ordered club houses. For this very reason, because they are of the ranks of the workers—the people whom the netters are pleased to term schweitzerkase fishermen—their limited privileges should be most jealously defended. The defense of their rights should not be left to them; it belongs to the State.

Things have come to a pretty pass indeed if these people may not undertake to secure the enforcement of the righteous laws without finding themselves the butt of cheap ridicule. In this resort by its opponents to such arguments, the League may find encouraging assurance that its growing influence is something with which illegal netters must reckon in New York waters.

SNAP SHOTS.

We publish in our angling columns a gratifying report of progress by Pres. Biedinger of the League of Salt Water Fishermen, an association formed in New York and vicinity for the enforcement of the laws relative to salt water fishing and the pollution of the waters. It is manifest that the members of the league are very much in earnest, and they have gone to work in the right way, building up a body strong in numbers and therefore certain to be influential. If they shall bring into their association all the people who are directly interested in its objects, there is no reason why they should not expect to have so much political influence that they may secure representation of their purposes at Albany.

One of the most interesting facts reported by Pres. Biedinger is the changed attitude of the men who were formerly engaged in net fishing in Jamaica Bay. This body of water is the chief amateur sea fishing ground near New York City. It was formerly infested with nets; and the line fishermen, most of whom are working people with opportunities for outings limited to one day in the week at the most, found that the nets were destroying even these restricted privileges. A law was secured abolishing nets from the bay. It was vigorously fought by the netters, but in the end they were compelled to submit to its enforcement. The result is that these same men have now gone into the business of boat building and boat hiring, and acting as boatmen and guides for the line fishermen, and are finding in their changed industry more satisfaction and profit than ever rewarded the more arduous net fishing. This result is one of the unexpected benefits thus accruing to a wider class than that for which the law was originally intended. There is every reason to believe that a like result would follow the strict enforcement of the netting laws in other localities where the line fishermen would increase under similar conditions, and provide another mode of livelihood for those who now engage in the toilsome industry of hauling nets.

Here is the enticing promise a Michigan summer resort proprietor holds out for the alluring of people to his establishment: "The streams in Michigan abound in brook trout. An expert trout fisherman and enthusiast has been employed by the month who will devote his entire time to fishing for the hotel. He will also conduct parties desiring to engage in this rare sport. It is expected that brook trout will be served to the guests as often as three times per week." The prospective guests are to be congratulated—those of them who shall get there early enough, or this year at least. The later comers will not be likely to find any fish, for no waters in Michigan were ever yet so abounding in brook trout that they could stand the industry of an expert "employed by the month to devote his entire time to fishing for the hotel."

The summer hotel keeper is not privileged above other men, and at the expense of other men to exploit the trout streams of his district for his own benefit in this manner. There are trout breeders who are engaged in the business of raising trout for market. If summer resort guests must have trout to eat three times a week or every day in the week, there is no reason under heaven why the fish should not be supplied to them, provided the steward buys his fish from the artificial growers whose stock is unlimited because capable of being kept up, and does not go for them to the public streams, which, once being depleted of their original supply, may be restored only with difficulty. This Michigan hotel man is only typical of many scattered throughout the country who have assumed that the native supply of fish or of game in their vicinity was something to be exploited for their own special benefit. The hotel kitchen door is too often open to grouse and woodcock killed out of season. The supply of the hotel guest's palate is the agency which has cleaned out many of our best game covers. The laws which forbid the taking of game for market are aimed directly at cutting off the traffic of the hotel table. There should be in every State in the Union a law similar to those which now prevail in several, limiting the catch of fish which an individual may take in a day or a season, and the amount which may be transported. We shall have these statutes all in good time; and moreover, one of these days public opinion will have been educated up to a point where no hotelkeeper will dream of advertising that he has employed a professional trout fisherman to fish constantly for the hotel table.
